In talking over the nesting ducks, Mr. Brayton said that he accounted for the selection of that locality by the birds, the cold, backward spring and the tremendous floods which had existed all through the West, as well as by the natural advantages for breeding purposes the lake-starred plateau below Bassett affords. He also said that several upland plovers' nests had been discovered on the sloping hillsides along the Sunflower, and that an unusual number of golden plover haunted the region this spring. It might not be amiss to state that Garfield and Rock counties are adjacent and that they have always been the center of the most prolific game region of the State. Some of the lakes also furnish good sport for the wielders of the split bamboo and lancewood, black bass abounding plentifully.

Speaking about the golden plover, the bird is extremely rare out here now, but in the old days when I first came to Omaha they were almost as plentiful as the little grass sandpipers. Occasionally in the early autumn some one reports having seen a small bunch of the birds, here, there or somewhere else, but seldom is a gunner encountered who has made a kill, even of a single bird.

Twelve or fourteen years ago there was little sport more interesting or more certain to be rewarded with a good bag than the shooting of this grand little game bird down at Percival or Bigelow, or up at Bancroft or Pendor, or even within an easy walk of Omaha itself, when he visited the broad pastures and plowed fields to the west of us in the early fall. In those days, too, he filled what would have been without him

a monotonous gap in the sport with the gun. The tinkling triplet of the upland plover had died away in the far South; the quack of the mallard and the auh-unk of the goose had not yet awakened the echoes on the marshes, and the open season on quail had not yet arrived, while the jacks were yet loafing in the well tempered airs of the Dakotas at the time this little mottled beauty put in an appearance.

The golden plover used to be familiar here for only about three weeks of September, when the fringed gentian had not yet folded its azure petals, and the high yellow disks of the moccasin still lit up the slanting hillsides, the pink and white of the wild morning glory yet dotted the dusty prairie grasses and splotches of gold and scarlet were encroaching upon the water maple's involucre. That was when the golden plover came down from the north and falling upon our oceans of freshly plowed ground, gorged himself to bursting.

The Nebraska gunner used to call the golden plover prairie pigeon, and the earlier rancher knew them only as rain birds. Many sportsmen, too, confounded the bird with the dowitcher, or better still, the Eskimo curlew, which species almost invariably came down here together, not in intermingling flocks, but simultaneously, after the newly upturned winter wheat fields had been soaked by the summer rains.

I will never forget a shoot I had on golden plover with A. H. Penrose, Johnny Hardin and Billy Townsend, all of the old shooting goods house of Penrose & Hardin, down near McPaul, over the river, in September, 1887. With Dr. Caples, lamented, we got stationed on the margin of a big broken field, from which we had jumped a slather of birds early in the morning, and had but a short time to await their return.

Way up in the sunlit dome they came, sometimes in long, dotted lines or wedge-shaped masses, like blue-bills on the river, now in ragged array, again abreast as evenly as marching infantry. Over the distant timber, where the cottonwood and the elm were yellowing, out over the intervening pastures where the rust was upon the cattle-cropped grass, where the bright gold of the yellowhammer's underwing flashed and gleamed, as the crimson-crested harvester hopped after the scurrying crickets, or when with querulous cackle he darted back spasmodically among the cottonwoods.

There they come now, I really believe, anyway, when I close my eyes it seems so—a long line of softly trilling whistlers, a line of swiftly cleaving wisps of gray and white and black, tinged with a golden bronze, and it matters not how they come, high up in the hazy winds, or low along the ground; their sweet little voices are always in the air, and how murderous man could empty volleys of shot into their ranks is something really to marvel at. But we did it, that September day, over and over again, and thought nothing of it, save to glory in the bag we were piling up.

There was not much need of a blind in shooting plover in those days, a few stalks of the sunflower stuck in the yielding soil, a bunch of tumble weed or low place in the ground, for in answer to their call, which is easily imitated, they would come on in to us with a rush. Hardin and I were at the lower end of the field and both hid behind a single bush of reddish sumach, which John had cut with his jackknife and stuck in the soft ground. In two hours' shooting we killed more birds than can be killed to-day in any region in the world in a week. Penrose and Townsend also had the same kind, although they were way across at the head of the big field and seldom got a crack at the same flocks that came in to us.

Hallowed September day, will thy like ever return? When and where can I once again see such a flying medley of black and gray, and brown and gold and white, jet black feet and bills, and tawny tails barred with ash? Where and when will my strained hearing once more catch that sweet tremolo, so plaintive and mournfully soft?

It will soon be September again down there at McPaul—and the early autumn sun will shine as soothingly from the smoky sky as it did on that day sixteen years ago; bright will be the gold of the flicker's wing, and the lapis lazuli of the lingering lobelia and the yellow disk and purplish rays of the aster will shine across the jet of the winter wheat, on whose borders the fluffy golden rod tinges the gray rag weed just as it did sixteen years ago; but there will be no long lines of brown and white and black, with flashes of bronze and gold, no soft, sweet and tingling unison of speckled throats, no lovely little feathered meteors of the hazy atmosphere over cottonwoods' top, over the close browsed pastures and odorous upturned loam. The golden rod, the poppy, the gentian and moccasin will be there, but no golden plover.

SANDY GRISWOLD.

Samoa 'Uma.

SAMOA 'UMA: WHERE LIFE IS DIFFERENT. By Llewella Pierce Churchill. New York: Forest and Stream Publishing Co., \$1.00.

It is not the usual picture of Samoa which one finds in these pages. Mrs. Churchill is convinced that the islands were never worth the price "always exacted from every one who sought to do some good for the island kingdom." The Samoans "are greedy and grasping, puffed up with a sense of their own importance, untruthful and never to be relied upon," and the privations and discomforts of living in the islands are, to a European or American, well-nigh insupportable. The author has had ample opportunity to study the matter. She knows her subject; she is a keen observer, and her views are entitled to respect. Despite her unfavorable depiction of Samoan life and character, she has written a most readable book. Gossipy and familiar in diction, it is yet thoughtful and instructive in substance, and it furnishes a most vivid, if not wholly satisfying, picture of the archipelago. It is not easy to lay down the book once one has fairly started on its perusal.—New York Independent.

CHICAGO AND THE WEST.

The Fall Shooting Season.

CHICAGO, Ill., Aug. 8.—Inquiries begin to come to hand for shooting localities for ducks and chickens this fall. I last week mentioned in these columns those counties in Minnesota which bid fair to be most attractive to the prairie chicken shooter. In addition to this district in Minnesota, there will be a very considerable shooting area in both the Dakotas this season. It is true these Western States are settling up very much, but when all is said and done, there is a lot of open country still left in North and South Dakota. It is hard to patrol and protect these great open stretches, and without question the game laws are not and cannot be fully enforced all over so great a stretch of country; yet none the less the sentiment in favor of the laws has notably increased within the last few years, and the enforcement in the way of seizures, confiscation, etc., in some of the shipping centers has done very much toward teaching the useful fact that the game law is not intended as an absolute dead letter. Therefore, so far from the prairie chicken being an extinct game bird, it is the case that there will be very good shooting indeed over a large stretch of country in Minnesota and in the Dakotas, preferably from 50 to 100 miles west of the eastern line of the latter States.

In Illinois we are in the doldrums. Our trapshooting is a thing of the past. We have a close season of years on the prairie chicken, and the Illinois law makes it necessary for every fellow to go and see the man before he can take out his gun. This is a state of affairs a bit annoying and not altogether welcome to a great many of our shooters. Welcome or not, however, we have to take our medicine; and if we don't want to wait for the quail season or don't want to pay a resident license, we can pay a non-resident license in some other State, of a good deal more formidable proportions, and take our chances with the increasing tide of sportsmen's traffic which goes into the Northwest.

Wisconsin is a State which should not be overlooked by the prairie chicken shooter. Berlin, Babcock, Necedah, Horicon and a great many points in the lower or prairie part of the State to the west of the above-named localities, will turn out a few days' shooting. Waushara county ought not to be overlooked. Wild Rose, Wautoma, Princeton and other points which can be reached easily, touch the country lying to the east of these localities between the Northwestern and the Wisconsin Central railroads. This is a sandy, rolling country, not very closely farmed, with some marshes and a considerable growth of buckwheat. I don't think this district is as good as that around Babcock and Necedah, but know of one man who killed between 150 and 200 chickens and grouse last fall in Waushara county.

Indiana can be marked off the map as a chicken country, pure and simple, and its stiff license law would bar most Chicago shooters, even were there very many prairie chickens left in that State. Iowa has some birds in the northwestern portions, but it is believed from general reports that the wet weather has rather damaged the chicken crop in northern Iowa and southern Minnesota.

It is a little early yet to talk about the quail crop. Last year reports were decidedly discouraging in the upper parts of Illinois, and it is not the case that any large breeding stock went over. If the prevailing wet weather has made it hard for the quails as well as the prairie chickens, then it would seem that we are not to have a very keen season in quail shooting this coming fall. Quails, however, do not drown out as readily as the prairie chickens, and, moreover, they have a mysterious way of disappearing and increasing without any apparent reason therefor; so that, perhaps, after all, we may see Bob White with us again this autumn.

Tamarack Lake District.

A friend of mine much interested in duck shooting, got some advice from Warden Matthews at St. Paul last week which may be useful to others who would like to know where they can get fairly good duck shooting this fall. Mr. Matthews gave Tamarack Lake, in Otter Tail county, as a likely tip, qualifying it with the remark, whose justice will be appreciated by all duck shooters, that it is impossible to tell exactly when the ducks will be found in any given locality or in what numbers.

Nine years ago Tamarack Lake was one of the best mallard waters in the Northwest, and numbers of Chicagoans made annual expeditions to its shores, the drive from Detroit being then something like twenty miles or twenty-five miles. The shooting there was ruined by two market shooters by the names of Griggs and Penniman, who hammered that district mercilessly for a season or more. These men, according to my friend, who formerly shot there, had eighteen blinds in different parts of the lake. These blinds were built snugly with rushes, and were entirely covered over. When the shooters were operating in the blind they had out a large flock of decoys, and each man usually had a couple of guns. As the blind was covered over, the shooting was usually done after the birds had bunched in the water or just above the decoys. My informant, who was shooting with friends in Big Rice Lake, a few miles away, said that he could hear the boom-boom! of the market shooters' guns nearly all day long. They killed a great many thousands of dozens of mallards, so many that they had a team continually on the road taking out their shipments. These market shooters both very famous in their way, and perhaps both good fellows enough in their way, though their lights did not lead them as ours do, formerly shot at Preston Lake, South Dakota, once also a very famous ducking ground. They went back to the Preston Lake country after leaving Tamarack Lake, in Minnesota. They killed so enormous an amount of ducks at Tamarack Lake that citizens of Detroit, under the leadership of a newspaper man, whose name, I think,

was Hamilton, invited them to leave the country, and couched the invitation in such terms that the shooters concluded it wise to depart. Of course this sort of slaughter would be impossible under the 25-birds-a-day clause of the Minnesota law; but the above is not a bad sort of tip as a method of solving the problem of excessive shooting. At any rate, that is the way it was solved on this once famous mallard water some years ago.

Following up the Otter Tail, above Tamarack Lake, one comes to Flat Lake, which, in the opinion of the Indians, a few years ago, was better than Tamarack Lake. My friend, Mr. Wells, of this city, who was formerly familiar with that district, says that it is as good a place for a fall trip as any he ever saw. If it be the case, as Mr. Matthews now thinks, that this lake is taking on some of its old abundance in wild fowl, it is questionable whether a better locality could be found for a ducking trip, and one ought to be reasonably sure, at any time after the northern flight is down, of getting his legal or personal limit without much trouble.

There is good shooting in the Mille Lacs region, also of Minnesota, and there is good duck shooting to be had out of Bemidji. I heard of one party who killed a couple of thousand ducks in the Mille Lacs district last fall.

All in all there is no occasion for the sportsmen of the Middle West to despair. There will be as many birds, both ducks and chickens, in Minnesota, the Dakotas and Wisconsin this fall as there were last year. Granted a good chicken dog and a couple of weeks of time, one ought to be able to make a trip very much worth while.

Ask the Warden.

There is one phase of the work of a State game warden which, it seems to me, might well be emphasized, and which I have never seen mentioned in any quarter. The State game warden, by virtue of his position is, or ought to be, the very man best posted on the game supply. If he doesn't know where the shooting is, then he isn't the kind of game warden he ought to be. If he does know, and if he is a sportsman, as a game warden ought to be, then he ought not to be unwilling to tell fellow sportsmen where the good shooting places are. If he represents a State which has a non-resident license law, he would seem to be all the more bound by several motives, to make public such information upon request. Naturally he wants to collect non-resident licenses to help him in his own State work. He can collect all the more of these if he can give some fair assurance to non-residents that their visits to the shooting country will not be in vain. Heretofore sportsmen have looked very largely to the sportsmen's papers for tips of shooting localities, etc. The papers do their best, but after all they are not wholly infallible and cannot, by the nature of their calling, be so well posted upon all localities as is the man at the center of shooting affairs in any given State. Time and again I send inquiries to Executive Agent Sam F. Fullerton, at St. Paul, Minn., because I know him to be thoroughly well posted in all the shooting and fishing localities of his State, and have never found him otherwise than ready to give assistance by way of detailed information. This entails extra work on the official, but it is work which, it seems to me, is not wholly in vain. The non-resident who goes into another State to shoot ought not to feel a grudge against that State, or the warden of that State, because he pays for the privilege of shooting. He ought not to pass the warden by. In a great many instances it would be of decided benefit if, when he put up his money he established nice personal relations with the very man in the whole State who could be most immediately useful to him by his advice. Maybe I am making Sam Fullerton and other able and obliging State wardens a lot of trouble by this suggestion, but at the same time I do think that this is something which might well be remembered by the State warden of any State whose abundance of game invites non-resident sportsmen's travel.

Speaking of Licenses.

Speaking of licenses, it was an odd thing that happened down at Ottawa, Ill., a few days ago. A young man of the town of Noble was contemplating marriage with a young lady of that neighborhood and approached the clerk with the purpose of securing the necessary license. At that moment the aforesaid clerk was making out a hunting license for an applicant. As the bashful bridegroom was somewhat rattled anyhow, he did not specify just what kind of a license he wanted, and the clerk made him out a hunting license on general principles. This the applicant thrust into his pocket and hastened away. The arrangements proceeded as usual in such circumstances, up to the time when the clergyman demanded the license. When he told the bridegroom that a hunting license would not do under such conditions there was something of a situation.

Grizzlies.

A hurried letter from Jack Monroe, just out of the mountains from a bear hunt with the party of Mr. Pinchot, states that they were fortunate in getting two or three nice grizzlies in at their baits, and I infer that the trip was a pleasant one and successful, as is usually the case when one goes out with Jack Monroe.

Old-Time Duck Shooter.

Mr. J. Swam, of Saperton, B. C., writes: "In reading the FOREST AND STREAM I frequently come across remarks about old age preventing some of us from enjoying ourselves as we formerly did, so I thought I would forward to you the accompanying description of an awful example which may be held out before the boys." The awful example is mentioned in a newspaper clipping from Lundyville, Manitoba, in the following terms:

"The oldest man in Manitoba, John McNabb, of this place, celebrated his one hundred and second birthday to-day, and is looking forward eagerly to the fall, when he expects to enjoy his customary sport of duck hunting."

Mr. McNabb was born in Kildonan, and is of Scotch parentage. He has been a user of tobacco from his youth, and believes the constant use of the weed has tended to lengthen rather than to shorten his life. He has spent the greater part of his life out of doors, having made more than fifty voyages from Winnipeg to York Factory in the service of the Hudson's Bay Company."

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

Uncle Doc's Hammerless.

"THESE yer hammerless guns seem all the go now," said Uncle Doc, "but they were small pertaters to the hammerless I had one afternoon when I was a boy. Ever seen the old Queen's arm I got?"

Most of us had. Up at his farm that slopes down to the Little Miami we had seen an unusually long old smoothbore which had, in Doc's father's time, been fitted with a percussion lock and shortened by a foot or so, and still had barrel to spare.

After satisfying himself that we were acquainted with the gun, he continued: "I used to stop school the spring term to help daddy on the farm; but these younger chaps like George [George was sixty-eight last birthday] had to keep on for they wasn't any use and rather in the road at home, and they sent 'em to school to keep 'em out of devilment. One afternoon we want very busy, dad said I could go out and get some squirrels; and I took the old gun and fixin's and went down through the woods. As I passed the old stone schoolhouse I could see the little folks in there all looking as though they'd rather be most anywhere else. I couldn't blame 'em for wantin' to be out in the woods like I was, and pretty soon here come George. He'd wined me and ast the teacher to 'go out,' and he went with me; didn't go to school any more that afternoon.

"George, do you remember how I'd let you shoot when we could get a rest shot at a squirrel?"

"We'd got a right fair bunch before that dad-burned old lock got out o' kelter, and I couldn't conger her up 'thout a file; so I took her off and there I had a genuine hammerless—the first one ever shot in these parts.

"How'd I shoot? W'y, I had an all-fired big jackknife and I opened it up and gave it to George; and when I'd get a squirrel to sit fer his plecter, I'd get rest side of a tree and aim, hold steady and duck my head down and say 'Ready,' and George'd hit the cap a clip with the handle of the knife, and I most always got my squirrel. George'd hold one hand up in front of his face fer fear of cap or powder 'fore he'd crack her.

"No, George, I won't forget about the pheasant. We'd hunted down across Harner's Run and back of Cedar Banks. George he saw a bunch up on a lim' and showed me. I says, 'Don't say a word or look that way. It's a pheasant,' and I walked him off another direction till we came to a leanin' tree and I got a good rest and a good sight and says, 'Ready,' and he cracked down on the old gun barrel, missin' the cap entirely. 'Durn yer plecters,' says I, 'why don't you hit her.' I was gittin' nervous, and I guess he was, too, fer he missed her agin. 'Dad-burn ye! can't ye hit her?' I got another sight on the bunch, an' more by accident than anything else he hit the cap.

"Yes, we got the pheasant, fer I hadn't been sightin' at his head like I did at the squirrels. I shot at the biggest bunch that time; and I tell ye, boys, I believe me 'n George and my old hammerless got the last pheasant in these parts at that shot. I never heard o' one since."

And here George put in: "I tell you, Doc, it just made me sick to have to go home without any of those squirrels; but I knowed if I did dad'd lick me fer playin' hookey from school."

FIFI.

More About Game Preserves.

I WOULD recommend to the careful reading of Mr. William H. Avis the following sentence from the pen of Didymus, who, in referring to the conversion of our wild forest lands into big private game preserves, says, "I also assert that it is foolish in policy, as it arouses bitter animosities, and the spirit of revenge which it incites is not in the interest of the owner or the preservation of the forests, as the recent incendiary fires sufficiently proves."

This puts the whole case in a nutshell, and as "the sentiment is sound, because it is built upon the foundation of truth," it may possibly convince Mr. Avis that there are two sides to this game preserve question, as well as to most other questions, and that those who have dared to differ with him as to the wisdom of his method of forest, fish and game preservation, are not necessarily hypocrites, envious souls, or haters of the rich.

I do not agree with those who think the private game preserve is necessary to preserve fish and game for future generations. If preserves are necessary let them be State or national preserves, and let everybody stand upon an equal footing with respect to them.

But as far as I am able to judge, preserves of any sort are not a necessity in the Adirondacks, where game of all kinds is more than holding its own. Our game laws, which are made better and still better, and more stringent as occasion demands, shows that the people are alive to the subject of game preservation, and need no help from the private preserve owner. At the same time there is no objection to that class of preserves that are built up out of lands which were originally barren of game and fish, which are stocked at the owner's expense, and which are used to propagate game and fish with the ultimate object of increasing the general supply. The owners of such preserves are philanthropists, who deserve, and who generally receive the heartfelt thanks of their countrymen. The objection is to the grabbing of vast tracts of wild forests and waters which are well stocked with game and fish, by persons who have no other thought or intent than to exclude others from enjoyments which they want exclusively for themselves.

There is no parallel between such preserve owners

and the farmer who posts farm lands. In the case of the farmer the posting is done in comparatively thickly settled districts to preserve his crops, fences and stock from injury. Then it is a matter of record that the farmer almost invariably grants the privilege of shooting and fishing on his lands to those who ask for, and who do not abuse the privilege. In the exceptional cases where the farmer arbitrarily excludes everybody, he has been denounced in unmeasured terms and has found no Avis to defend his action. If we apply Mr. Avis' system of reasoning in making a deduction from this fact, we much reach the conclusion that the farmer is not defended because he is poor, and that these preserve owners are defended because they are rich.

Who ever heard of one of these preserve owners granting the privilege of shooting and fishing in his preserve to all applicants on the condition that they behave themselves like gentlemen? Why the mere asking for such privilege would be resented as an impertinence. It is this difference between the farmer and the preserve owner that causes all the bitterness against the preserve owner, while there is none against the farmer.

It seems to me that those who advocate turning over to the millionaire preserve owner the preservation of our forests, fish and game, cannot be aware of the extent and intensity of this bitterness, or how certain it is to spread and intensify as more and more of our wild forest lands are fenced in and the opportunities for recreation are more and more curtailed.

Now I ask in all candor, and with envy and hatred toward none, is it wise to advocate a policy which is almost certain to bring ruin and destruction on the very things which we wish to preserve? Is it just to advocate a policy which gives to the few that which is necessary for the well being, and which of right belongs to the many?

Is it patriotic to advocate a policy which is un-American in principle and an insult to the intelligence of our people?

I think that these questions should have careful and impartial consideration so that wise and intelligent action may be taken.

Personally, I have but little interest in this matter, aside from a desire to see right and justice prevail. I certainly harbor no feelings of envy or hatred of the rich as a class. Many of my best friends are people of wealth, and I heartily agree with Mr. Avis that many rich people are using their wealth to make the world better and happier. On the other hand, many rich people are using their wealth solely to gratify their own selfish desires regardless of the rights and well-being of their fellow men. I believe it to be the duty of all good citizens to rebuke those who use wealth in the latter way. Education first and an intelligent use of the ballot afterward is the correct way to administer this rebuke.

JOS. W. SHURTER.

GANCEVOORT, Aug. 5.

Editor Forest and Stream:

What can anyone who knows anything of history think of Raymond S. Spears' statement that "In France this same question of game preserves flamed into revolution."

The inference is that game preservation was the cause of the French Revolution, or at least was one of the main causes. Of course everything pertaining to the old regime was inveighed against, but game laws were nothing to the citizens of Paris, who would not know a grouse from a small barnyard fowl if he saw them alive. Paris and the other great cities were France in those days, and in writing for people who do not know, it is unfair to talk of game preservation as a cause of the Revolution. To those who do know, it is absurd.

I observe Mr. Spears is left to fight his battle without much assistance. There are not many of the supporters of FOREST AND STREAM who like anarchistic and communistic teachings. "H" does indeed try to say something in favor of his chief, but gets out of his depth at the first step. He supposes "it is generally known that nearly all the tillable land in England is owned by a score or two of the lordly old families to whom it has descended from feudal times," and also tells us that "scarcely any grain is raised in the country, for the reason that very little land is obtainable by the working classes to raise it on, and England must import her breadstuffs and lose a great proportion of her population that ought to be kept to enrich the nation." It would hardly be possible for one to lay bare one's utter ignorance more completely than "H." has done in these few lines. Time is wasted on such as he.

I have used a gun and rod for many years. I love the woods, but I detest this mixing up of talk of love of nature with love of slaughter. It seems to me hypocritical cant. You can travel through most game preserves unarmed and welcome. It is only he who "loves the grand old woods" so well that he wants to murder its denizens who raises an outcry about game preservation.

I have had a great deal of pleasure in seeing how close we could drift to a deer feeding at the water's edge before it took the alarm, and I have watched the movements of wild game with a gun across my lap which I would not use, and had more enjoyment than in killing.

LEXDEN.

MICHIGAN CITY, Ind

CHARLESTOWN, N. H., August 7.—I can only attribute the great number of deer seen in this vicinity, on both sides of the Connecticut River, within the past two years, in one case seven in a herd, to the overflow of the Blue Mountain Park twenty miles north of here, established by the late Austin Corbin. I think this increase is of itself evidence and argument in favor of the game preserve, for it does not seem possible that all these animals should have come down from the north end of the State beyond the White Mountains.

VON W.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Who Protect the Game and Why.

BUFFALO, N. Y., Aug. 10.—*Editor Forest and Stream:* In Mr. Thayer's article in FOREST AND STREAM of Aug. 8, there are a few points made which I cannot let pass without having a word to say. He quotes from Mr. Charles L. Paige in July 4 number: "In many cases it is the men who kill animals directly who are most active in preserving and increasing the animals for a useful purpose. The men who shoot game are at the present time the men who are most earnest in the efforts to protect and provide for it." Mr. Thayer says, "Does Mr. Paige mean this for a joke?" I do not know whether he intended it for a joke or not, but I should say he most assuredly did not. Does Mr. Thayer mean that it is a joke that sportsmen protect game for a "useful purpose," or that they protect it only to kill it. If the former, I claim that it is for a useful purpose that sportsmen hunt and kill game; if the latter, I think Mr. Thayer is carrying it a little too far. I pretend to be a sportsman, and as such as just as much interested in the protection of game in parts of the country where I never expect to kill any, as I am in localities where I expect to derive direct benefit from its protection, and I think if my hunting days were over I should still be interested in its protection, and if I understand myself correctly, from a sportsman's standpoint.

Mr. Thayer goes on in reference to the work of the Biological Survey, which, of course, is doing a grand work, and says, "and that as a choice of evils, it often joins ranks with sportsmen, preferring to keep up a species even for them to decimate rather than to see it vanish altogether." This is compliment enough, although Mr. Thayer designates it as a "choice of evils," but, nevertheless, he admits that it is the sportsmen who have done the most to keep up the species. In joining with the sportsmen, the Biological Survey is uniting with the strongest force in game protection, whether that is exerted to preserve the game for "useful purposes," or that they may kill it. The results are what count. It is the sportsmen who are limiting the bags. It is the sportsmen who passed the laws to protect the bull moose, and it is the sportsmen who have passed the laws to protect species for a period of years in sections where those species are liable to become extinct. This may not be scientific protection, but it is using pretty good judgment.

Mr. Thayer contrasts "the naturalist striving to save it to study and admire," and "the sportsman, on the other hand, that they may kill it." I would like to ask if there are not naturalists who are sportsmen and sportsmen who are naturalists? I think a good percentage of the sportsmen are naturalists to some extent or other. Has not the sportsman the capacity to study and the soul to admire game in its wild state? A true sportsman has no desire to kill all of the game he sees. Science is indebted in many ways to sportsmen and hunters for much of the knowledge acquired about game.

DIXMONT.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Why Not?

MUCH has been written, much more has been left unwritten, because it wouldn't be printable, and still there rangles in the breast of many manly men unsaid things of "field companions." The subject is so broad and so diversified in general results that to my mind a general discussion can never cover it. Individual nature alone seeking a kindred spirit can best create many problems instead of solving one.

A gentleman was recently pointed out to me in a café as being a fine sportsman, the best of fellows at home and at the club, but a hermit in his hunting. I afterward met this man and spoke to him of his reputation and habits a-field. He smilingly replied, "Well, I have tried them all, and they won't do. Why there is Mr. A. I simply love that man; he is the best ever, and I want to keep on loving him, and the only way to do it is to leave him at home."

We all know a Mr. A. or two, the world is full of them; on the other hand I believe there are a goodly bunch of "Col's," men who should wear the soubriquet from manly actions on the field of flush and flutter, or the streams of "laughing waters." I personally know some A's and some Col's. "So do we all of us."

Observation teaches us that in recent years it is being discovered that she, who pours our coffee, and to a greater or lesser degree plays the harp that brings the best music to our destinies, she whose gently touch makes love mirrors of our dogs' eyes, she who believes we need a new gun to wear away the effects of our burdensome business cares more than she needs a new fur coat, she whose admiration for the delicate, makes the fly-rod more beautiful to her, as it seems so to fit her entire nature—she may be the one in whom we shall find an ideal companion for our outing.

Why not, then, take her along, thus brightening the sunshine and intensifying our pleasures in camp and a-field. She will take the coaching and the complaining with the same equanimity. It gives one the chance of "knowing it all" more than in any other walk in life; she bows to his supreme prowess; one kill in twenty makes a double hero of him instead of a "dub" in faster company; excuses are all framed with reason; and he comes home only to find that the front door should be enlarged to admit his expansive self. Then, too, that mountain air, and the fatigue of the trip cause refreshing sleep to her, and cares of home drop into insignificance. Of course, she cannot go so far nor so long as her bigger and more rugged other self; yet a little tramp is to her what a long one is to us. She can't wade a rushing stream, but most streams have their pools, and some pools are beside a delightful bank. And then comes the bass fishing in a boat.

She takes up little room, does not make the rowing much harder, and at this game see to it that when you get home a "coal hole" won't admit your 200 pounds, while she squeezes in the front door.

In the South, where in many places shooting is done from a wagon or from horseback, she can gladden the day by her presence at all hours, and not spoil the shooting much.

My first experience was on the Indian River in Florida, when Madame took six big trout to his two; later on the Halifax, when Madame put all men to blush by her captures; and again on the Willowemoc, when Madame had three rises to his one; and again on Hunter's Lake, at DeBruce, Sullivan county, New York.

They were at The Heathstone Inn, when he asked Mr. Royce to call him at 5 o'clock in the morning. Madame said, "That must include me." At 6 the next morning they were off on a buckboard for the lake. At 7 they embarked in a cross between a sail boat and a wash tub, but just the sort of a boat for bass fishing, inasmuch as it would go everywhere at once. They cast their attractions overboard and fishing began.

In a little while he cried, "Turn the boat; my bait is moving away. There! steady it there! Madame, just move up to that next seat! Willie, hand me that landing net! Paddle on the left side! My dear, sit still! What are you moving for? There will be trouble here in a minute! Please reach over and take my pipe. Can't you keep this boat pointed the other way? There! I guess I have given him line enough. Keep your rod away from mine. Reel in your line. Don't you see you are in my way? Reel in faster! I'm going to strike him now. Now!" And with a lunge backward the rod makes a flying leap, unweighted by even the bait—'tis only the weight of his boots that keeps him in the boat.

Did Madame smile? No. Did she know better? No. In that gentle heart of hers was nothing but sympathy, and the forms of reason had been built for those excuses long years before.

Chapter two of the doings that morning adds at least a moral to the subject of Field Companions. A little later a bass madly grabbed Madame's bait with a rush born of despair, shot skyward and at the limit of his ascent cast the bait and hook three feet in the air, and scurried to his hidden depths to think it over. Madame flushed and stamped her foot, while he said, "Why didn't you keep a taut line on him? Why didn't you work your rod close to the water? Why didn't you see he was coming to the surface? Why didn't you ——" Here he is interrupted by the whizz of his own flying reel, recovers his rod and the fight begins with, "I'll show you how it's done now." He stands up, sends the rod along the surface of the water, straining it in every joint, once around the boat; then back and forth, suddenly a pickerel two feet long heaves in sight by the side of the boat, "sees things," and with a lunge that drenches Madame from head to foot, disappears to rise no more, while he, crestfallen, sits him down, and well framed excuses are in evidence in great abundance. Does Madame smile? Yes. Didn't she know better? Yes. Wasn't it the wrong time to smile? No.

At 1 o'clock they drive up to the Inn, and two magnificent bass are laid on the stepping stone, while Madame is congratulated by all. Did she catch them both? Yes. He managed the boat.

Proprietor Royce notches the kitchen table where the two fish lie. The bass record is held by Madame at DeBruce.

Why not take her along? T. E. BATTEN.

Trout, Deer and Exploring.

[Being a report from a brother in Vermont to a brother in Pennsylvania.]

NORTH BENNINGTON, Vt., Aug. 4.—I must tell you of my fishing trip on the Fourth this year. I went alone, as I always do, not that I don't like company, but I never found anyone who could follow me on my long tramp, and the other fellow seldom wants to go the same direction. I had been planning to go for some time, and as Saturday was the Fourth and I would have Sunday to get back; I started Friday morning.

In the first place I took too much grub, and so had much useless weight to carry. I took one of those canvas valises that expand, a small spider that would go inside, bread, bacon, cheese, tea, catsup and numerous other supplies. This was all a mistake; if you ever go on such a trip remember and go light. I got away at 5:30 in the morning. It was three miles to the foot of the mountain, and I took it easy. I crossed the first ridge and got to the Taft Branch at 10. Here I filled the kettle and had a good dinner, rested an hour, then started to fish up the stream. By 1 I had 32 trout, and as I could not use any more, quit and struck over the next ridge to the east. About 3 I could hear water run somewhere, and soon came to a small stream running north. I went along until I found a good place to camp, got out my pack, took my ax and soon had a bough house built. I cut down a dead spruce for wood, then went to the brook and dressed the trout. I could see lots of small trout in this stream. When I had a good bed of coals I fried the fish, four spiders full. You can imagine the feast I had that night. It was warm and snug in the lean-to, with a roaring fire in front. I went to sleep about 9, and except for fixing the fire once in a while, slept very good.

In the morning the sun rose clear, and after breakfast I took a straight course for the east, intending to strike the Deerfield River. I came out on a high cliff, and climbed a tree to get the lay of the land. There was a wide valley, and then another high ridge, all heavily timbered with spruce. I struck out, and in about an hour came to a brook. Here I could see more trout, but I wanted to explore, so kept right on. Pretty soon I saw a fawn run out of the brush, and a big doe followed. They were only about thirty yards away; before I reached the top I saw three more, all does, and all within range. On this ridge it was good

walking, the ground being covered with moss. After going a mile or so it began to descend, and I could see a great level tract, and beyond was another mountain. As it got lower, I came into a hardwood growth, here I saw another doe, which ran a little way and stopped; she kept looking toward a clump of brush, and soon a big buck with short spikes ran out. After crossing two more brooks I reached the west branch of the Deerfield at about 12:30. I got dinner, caught a few nice trout, then thought how foolish it would be to catch a lot, as they would spoil before I could get home.

I wanted to find Lost Pond, and as I figured it, must be about northeast from where I now was. I struck a straight course and traveled steadily until 4 P. M., when I thought it time to call a halt for the night.

In the morning I looked my best, but could not find the pond. I think it must be grown up to alders; there are very few who can find it now, as there is no outlet. I finally gave it up and struck for the Roaring Branch, which runs into Arlington. I came out at a deserted mill on that stream, and fished down two miles or so until I got my 6-pound basket full of fine ones. Then I went down the branch to Arlington, reaching there at 6, and had to wait until 9:30 for the train. I never had a better time. Come up next summer and we will find Lost Pond. NED.

Fish and Fishing.

Desirable Legislation Refused.

At the last meeting of the North American Fish and Game Protective Association, complaint was made by the lessees of Canadian salmon rivers, of the difficulty of securing convictions under the Canadian law against parties known to be poachers, and possessing the necessary implements of their illegal calling in close proximity to the salmon pools, unless proof is forthcoming that they have actually been seen in the very act of violating the law. A resolution was unanimously adopted by the Association and forwarded to the Federal Government, asking for the amendment of the law so as to provide that it be a punishable offense to possess spears or other appliances for illegally taking fish at times or places where it is unlawful to use the same. I regret to have to state that notwithstanding the generous support of the request given by the Minister of Justice for Canada—Hon. Charles Fitzpatrick—I have been officially informed by the Minister of Marine and Fisheries "that this question has in the past formed the subject of consideration of this department, and the conditions have been such as to render it inadvisable, if not, indeed impracticable, to attempt such broad legislation as is suggested." This decision of the Minister is the more to be regretted that it is often impossible to secure convictions against poachers known to be such, under the law as it at present stands. Only to-day I read a report in a New Brunswick paper of alleged dynamiting on the upper waters of one of the best tributaries of the Restigouche for salmon. So long as it is impossible to convict and punish offenders until they have actually been seen in the act of destroying the fish, so long will the illegal slaughter of our game fish continue.

Lake St. John Salmon.

I have had several reports this season of the taking of small salmon in Lake St. John and the Grand Discharge, and now comes a report from the Peribonca River of the taking of a number of these fish during the last few days by Dr. Frank Watson and Mr. Ladd, of Boston. It is gratifying to be able to add that these two excellent sportsmen returned to the water the young salmon so caught by them. There is every reason now to hope that the planting of the salmon fry in Lake St. John waters during recent years will result in the stocking of the lake's feeders with the adult fish, though it will yet have to be shown whether the mature salmon will return to the Lake St. John waters after their descent to the sea as smolts. The experiment is to be given a good trial, and the Roberval Hatchery now contains 250,000 young salmon, which are to be liberated in the fall. There are also 750,000 young ouananiche in the hatchery, and together they manage to dispose weekly of fourteen large beef livers.

Mr. A. Mitchell, of Norwich, Conn., has been one of the most successful fishermen this season so far, at the Grand Discharge, having killed 48 fine ouananiche in parts of three days' fishing. This is Mr. Mitchell's second visit to Lake St. John, and he is delighted with the sport it affords. Lieut. Beale, of the American Navy, has also been very successful during the last few days at the Grand Discharge, and so also have been a number of foreign anglers, among whom may be mentioned Colonel and Mrs. McLean, of Bermuda, and Miss Geary, daughter of the Governor of the island, and the Hon. Oscar S. Straus, of New York, member of the Arbitration Court at The Hague and ex-Minister to Turkey. E. T. D. CHAMBERS.

Black Bass and Drinking Water.

BOZEMAN, Montana, August 5.—*Editor Forest and Stream:* Replying to your inquiry of July 31 as to whether the presence of black bass in a lake renders it unfit for drinking purposes, I unhesitatingly answer no. I am not aware of any scientific evidence bearing on the question, but common sense should convince an observant person that no deleterious effects to the water could possibly ensue from the presence of our native fishes. A possible exception may be the German carp, a bottom feeder, which muddies the water by stirring up the bottom, and by disturbing the sediment may release deleterious or unwholesome gases.

I know of numerous reservoirs which supply drinking water that contain black bass and other fishes. Their presence is rather beneficial than otherwise by devouring the free-swimming organisms that, while they may not be injurious, do not add to the potability of the water. J. A. HENSHALL.

CHICAGO AND THE WEST.

Bass Season.

CHICAGO, Ill., Aug. 8.—Nothing special is doing in the way of black bass fishing just at present, and most of the anglers seem to be less eager than they were sixty days ago. The largest bass reported for the week was a 5¾-pound big-mouth taken by Mr. J. White, of Chicago, at Eagle Lake, Waukesha county, Wis. Mr. White intended to have it mounted. He did not yield to the advice of his friends to turn it into the live ponds near the hotel, but packed it away carefully in the ice house. That night the rats got busy and ate several sections out of the choicest parts of the specimen, quite ruining it for the purpose intended.

The once famous water of Gogebic Lake, Mich., turns up once in a while with a good catch, and this week the passenger department of the Chicago & Northwestern road states that there has been excellent fishing at Gogebic this season. On last Wednesday the take of visiting sportsmen included one small-mouth, which weighed 6¾ pounds, one 6 pounds, one 4½ pounds and one 3½ pounds, with a good sprinkling of pickerel. These are extremely heavy weights for black bass. The weather is reported delightful at Gogebic. It need not be said that the Northwestern trains make this resort very accessible.

A Bass Vacation.

Mr. A. W. Hale, of Chicago, is an Englishman by descent, who takes very kindly to the American methods of fishing. He has done considerable bait-casting in the Chicago district, and is now ambitious to essay new fields. He asks where he can get a good place for himself and wife for a quiet vacation, having in mind some of the small-mouth bass fishing on the Mississippi River, near Alma. I was obliged to tell Mr. Hale that the river there is a very strong and heavy water, requiring the services of a boatman in order to have pleasant fishing. Three in a boat are too many, and Mr. Hale would not want to leave his wife ashore. Hence, although sure he would have good sport on the Mississippi, I rather counseled his going to the White River, above Princeton, in Waukesha county, Wis., where he could have fly-fishing or bait-fishing for small-mouth black bass in a very comfortable and sociable fashion. Mr. Hale also had in mind the St. Jo River of Michigan, and also Gun Lake, Michigan. It is probable that he will settle upon the last-named point for his vacation, which I hope will be a pleasant one.

Speaking of the St. Jo River, reminds one that a little party of Chicago anglers, Messrs. F. N. Peet, Fred Smith, E. R. Letterman and another friend, took 50 odd bass in that stream last week in a couple of days' fishing. They did most of their fishing with a small spoon and pork rind bait, and had a very pleasant little excursion.

Preserved Baits.

An inquirer asks regarding the efficacy of preserved and salted baits. Frogs and minnows are put up in preserving liquids nowadays, such liquids being, I presume, largely composed of formalin. Personally, I have never used these baits, but they look perfectly lifelike and are said to be good. As to the salted minnow, I have seen it do very deadly work on Michigan streams in the early spring in the hands of bait-fishermen, and we have no less an authority than Izaak Walton to tell us that the trout will take the salted minnow eagerly. I see no reason why a preserved frog should not catch bass all right in bait-casting, where the bait is kept in motion. Even did the bass reject it once in a while, at least a good per cent. of the fish would be taken on the strike.

State Fish Wardens.

The following fish wardens were appointed by Governor Yates yesterday: W. Glynn, of Chicago; E. E. Caldwell, of Havana; John Scott, Jr., of Berlin; J. Bird and A. Williams, of Quincy. The appointees will at once assume the duties of their office. This action is under the new fish and game law, which went into effect July 1. It has been feared by a great many that the change resulting in the lessening of the force of deputies throughout the State may work to the detriment of the shooting and fishing interests, but any criticism of the new law is premature at this date, since it has not yet had time to reach test.

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

Forest Fires and Fish Destruction.

PASADENA, Cal., July 31.—*Editor Forest and Stream:* Your issue of July 4 contains an article on the Adirondack fish mortality written by Mr. W. E. Wolcott, whose ideas are correct as to the recent forest fires causing the death of so many trout. The heating of the creeks to above the temperature that trout can survive in is non-sense.

We fishermen of southern California have had just such experience with forest fires. For instance, the Arroyo Secco, a beautiful stream that heads behind Pasadena some twenty miles north, used to be a rendezvous for anglers. Splendid creels of trout were caught for fifteen years within the writer's experience, while now there is not a living trout in that stream. The same elegant pools, hides and riffles are there, but no trout, not one. The cause of the complete devastation was one forest fire that swept the canyons and faces of the Sierra Madre Mountains, reducing timber and brush to ashes. Then came a great rain that made lye of those ashes; and this mixture washed down into our creeks, and poisoned every living fish from source to mouth.

This same thing happened in Saw Pit Canyon, behind Monrovia. The San Gabriel River, where the fires did not reach, has still its full complement of trout.

JOE WELSH.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Angling in Nova Scotia.

ABOUT July 1 we were looking hourly for a telegram that the trout had appeared. At last it came. Several had been taken by boys off the wharf, and, as we had previously made all necessary preparations, were soon on the road to our favorite resort twenty miles away.

Two carriages were necessary, and one that contained our provisions, etc., was to be sent back at once. The day was hot, and on going through some woods on our way, not far from our objective point, I noticed for the first time, some blue-winged flies darting about, a fair counterpart of our artificial Jenny Linds, and I mentally selected from my book my favorite fly for the day.

It was late in the afternoon when we launched upon the cove and my companion before the boat had entirely left the shore, was hooked into a splendid sea trout. In another moment, as quickly as I could throw, I had one, too, and for an hour the sport went on in feverish haste. We anchored the boat and had scarce any necessity to change our berth, they were so plentiful. We had indeed struck the time to a nicety, and were able to send back with the returning wagon three dozen splendid fish averaging $2\frac{1}{2}$ pounds each.

The next day we had a glorious time. Never was our visit more propitious, more successful. Some captures ran up to 4 pounds, and we often caught two at a time, but not 4 pounders. When the sport slackened a little we thought we would try some of the pools well up the small river that emptied into the cove. There are two rapids near the mouth rather difficult to face, but with local help a small boat was carried successfully past them, while we portaged the rods and oars and landing nets. On the level reaches above there was scarcely any current, and we rowed leisurely along. Here and there, however, we came to favorite spots, and a good sea trout was hooked, and the experience was novel and delightful. What a stretch of lovely level water running into the barrens two miles up! The country was flat and desolate except for a thick coat of low brush, and here and there a few stunted wind swept spruce; but the fish were ready for the fly, and many fine ones came to our net. It was virgin ground to us, and the sights and the few strange sounds affected us strangely. The quiet hush of the wide waste, the utter stillness for miles around, far from any habitation, contrasted with our spirits, and the taste every now and then of a new-found prey, kept us agreeably excited. When not casting we let our flies trail behind, the rods lying idly over the stern, and it was the acme of fun to see when, every now and then a fish would strike and the reel sing, how eagerly we would grasp the rods and play, and net the fish. On this singular canal-like stream for two or three miles, are numerous places where the trout rest, and the sportsman is kept ever on the alert. At evening we came back over the rapids at a dangerous pace, and shooting out into the cove again found the fish still responding to our casts. Climbing the wharf, we could not resist the contemplation of our little fishing preserve, as it lay beneath the bright moonlight, quiet and lovely in its rugged embrace of sand and rock. Then we were the only fishermen, and for a few years later; but ten years after, at the same season, were counted at one time no less than ten boats, each with a couple of anglers, swinging their rods over the very spot where we had netted our choicest fish. It had fallen a prey to telegraphs and railroads, and the invisible communication of thought and news. Gradually our fond little bit of water had attracted to itself an army of sportsmen, its exclusiveness to us had passed away, leaving us the fragrant memory of many successful visits, and is now known from Canso to Montreal, and even New York.

June, July and August are favorable months for these sea trout, and we found that the ocean tides had much to do with success. At the mouth of some frequented stream, perhaps some small rivulet flowing through a bank of sand barring the entrance of the Atlantic to a wide and spacious inlet, where the tide ebbs and flows, they are sure to be found. I have learned that as the water is about to turn at its lowest ebb, they seem most playful, most apt to take. On one occasion this was very marked, just where the outflowing water of the river mingled with the first flush of the returning tide. They seemed to be waiting for the turn, for, as we threw into the inviting swirls they readily took our flies, which before were refused, and excellent sport they gave. Handsome trout, bright as polished silver, and fresh from the ocean. The time and the occasion passed rapidly, however, as the rising waters drove us further up where the stream widened, and where we were not so successful. On most of the rivers, however, flowing into the Atlantic, are well-known spots beyond the reach of the tides, where the fish always rest, but during a freshet, following a drouth, they ascend rapidly and seldom remain long in their resting places near the sea. This is the time to cast for them, for, if they remain long in the river, they are not apt to rise to a fly. When fresh from the ocean either trout or salmon are surer sport, and water often flowing with considerable force and rapidity is better than still pools. I have seen them ascend rapidly between these, over shoal stretches, with a strong and steady flight, that seemingly nothing would swerve and observed them congregate in deep spots, but small and contracted. Lying well out in the center they would scarcely move, and keep their respective places for hours at a time with no perceptible motion or exertion. Salmon often accompany sea trout. In many pools I have frequently seen them lie side by side, waiting patiently for the long-looked-for rain to swell their highway and broaden it for their flight to the lakes beyond. It is during this waiting time that dangers gather thick and fast around them. Boys with stones and snares of various kinds, in the clear water, soon become an especial peril, and the spear driven, often by the hand in need of food, ends the life of many a noble fish. The most tempting lure has little attraction. To it they scarcely ever rise, and if they are capable of experiencing the emotions of hope and fear,

these must be ever present with them during this waiting time in their narrow home, for the mechanical devices of the hand and brain of man, on half a hundred streams, could nightly tell their tales of destruction and death. I was once fishing on one of the streams of the island of Cape Breton some years ago, and returned to the dwelling of my host late in the evening, unsuccessful. He seemed annoyed that the poor fish had not volunteered to be slain and respond to my oft repeated throws, and promptly offered to drag the pool we had cast into that very night with his net. This I suppose he had often done with the dexterity and indifference of an old offender. After the excitement of the day and the anticipation of legitimate takes from this very pool on the morrow, we preferred a restful sleep and immunity from any official visit from the not too watchful river warden, as a sequel of the night's adventure.

The Margaree, in Cape Breton, is a splendid stream. Not so much perhaps on account of its lovely fish, as for its clear and sparkling water, its ever winding course, and above all its superb pools and shady reaches where the fish love to linger. I have seen in the thick mist of the early morning the salmon fisher, quiet and ghostlike, wade carefully, stealthily, step by step, slowly, slowly, far out over the clear gravelly bottom of this famous river till the water came waist high, and then throw and hook his fish with all the skill, the certainty, the dexterity that alone comes after long practice and success. I have seen this repeated time and again till the fruit of his triumph lay like a line of silver sparkling upon the river's bank. Year after year, season after season, numbers of fishermen have had this experience till the water has become in its fame world wide, and identified with all that is best and loftiest in the sport. On this branch of the river, well up, and perhaps a little later, good sport is always tolerably sure. There the pools are well multiplied and are often near the houses of prosperous farmers, where good lodging and accommodations can be had. I have wandered over the meadows contiguous to these pools, and thrown my flies upon the circling eddies of the stream, and landed many a splendid fish. At all times great care should be exercised and strong tackle is essential. One morning, a companion around a bend of the river from where I was fishing, happened to throw just over the spot where a monster trout was lying. For a brief instant the reel sang and the rod bent with the force of a 3-pounder, which carried away flies and cast forever. Often the deepest spots lie well under a perpendicular wall of rock or slate, when a long wade and a long cast are necessary. Many times has my unusual care in this respect been richly rewarded in thus approaching a suspected spot, with the result that a sea trout, of perhaps 2 or 3 pounds' weight, has had to fight unsuccessfully for its life.

Many features of river fishing are very attractive, but after all, give me that in or near the salt water. To me this is always welcome sport; for there is a variety along the seashore that is never found inland. Its ever changing scene, its sounding music and its sweet and bracing air give it a peculiar charm. There is, moreover, a greater variety in the weight and size of the fish, and a chance for some novel experience. On one occasion in an ocean cove, we had cast in vain near the entrance of a stream, and then rowed down toward the ocean, where we threw our flies and were rewarded with some good takes. Sometimes a three-quarters of a pound fish would come to the net, then a much larger one, and again perhaps a half pounder, and so on with varying luck. Once, when the sport slackened, the head of a common seal, that strange link between the bear and the otter, rose not far from the boat, and wonderingly looked around. We were near enough to see the quaint little eyes and peculiar nose, and to diversify the sport, and insure some excitement, my friend tried hard to get hooked into it. Once I thought he had succeeded and held my breath for a moment, conscious of what would surely follow, but the hook came skipping back over the water and the chance and the opportunity passed. It seemed too bad, as we had quickly, in imagination, while the quarry was in sight, pictured a long and desperate struggle oceanward with this huge *Phoca vitulina* of the sea, that would have eclipsed everything we ever had with the insignificant *Salmo fontinalis* of the streams. I was at the oars and did all I could to assist in the attempt, and had the hook found a resting place in the thick scalp, the strong semi-salmon rod and tackle of my friend, and the quick motion of the boat, we would have together put up a good Santiago fight. Near by, where this occurred, is a curious little lake, quite near the sea and only connected with it by a tiny rivulet running beneath a culvert across the highway. It would be thought absurd that trout of any size would ever attempt to gain the lake by this little contracted avenue, but we were told that at certain seasons it was alive with fish. We landed from our boat and endeavored our best to throw into it from the bank, but without a skiff it was impracticable, and we had reluctantly to turn our backs on—as we supposed from the stories told of the spot—a million barrels of sea trout at least a couple of feet in length.

It is most interesting and curious to listen to the stories of the ordinary fisherman as to the best spots for angling, and their estimate of the size and numbers of the fish. They are always engaged in more profitable work and are not generally reliable upon the subject, not having experience. We were told on one occasion by an old fisherman in his own peculiar drawl, that there was no use for us to ascend a certain stream we were bound for, that there were no trout there and we would have our labor for our pains. We went, however, and when returning, our creels in the boat were like lead, filled to the brim. The old man met us at the landing place and when within hearing distance, I praised his prophecy. At my suggestion, when we landed, he undertook to toss like a bundle of hops, without the least suspicion, the empty baskets, as he supposed, from the boat. After a moment's struggle his words came with fierce and pronounced invective, "I call you nothing but beggars." He tumbled quickly to the true position of affairs, with astonishing comical

gestures and grimaces that would, I believe, have defied an Irving to imitate, while we as quickly tumbled to our full length on the grass, weak at knees, and screaming as never before with laughter.

Lake fishing is indulged in all over Nova Scotia, and excellent sport is annually afforded, for there is scarcely a county that cannot boast of some good water. Many are thickly dotted with lakes abounding in trout. Guysborough and Halifax counties, and some in Cape Breton, are particularly fine. Often takes of fifty or a hundred are made in a few hours, and while the vast majority no doubt weigh less than a pound, many would turn the scales at 3 and 4, and maybe still heavier. As a matter of taste, as intimated, I prefer the streams near the shore, and the ocean coves where the brilliant *Salmo fontinalis* love to linger, and when hooked show royal fight. There is generally too much sameness in the size and quality of the fish upon a lake, and one easily tires of the sport. I have had an interest in a folding canvas boat for many years, and have used it a great deal in this kind of angling, but the novel and pleasant drives to out of the way places, the exploration of virgin waters, far from any human habitation, in the heart of some immense tract of wood, often coming upon some wild and picturesque scene and starting to hurried flight many a waterfowl, has delighted me more than the actual capture of a hundred fish. It is true that at the proper time they take the fly with great gusto, and little skill is required, but to me this is an absolute drawback to the sport. We never use bait. The artificial fly is the only lure necessary, and two can be thrown on the same cast with safety and profit if numbers is the point aimed at. I have found a Jenny-Lind and a Jeremy-Diddler both good killing flies, but these fish are not fastidious like their cousins near the sea, and any ordinary fly will usually do. I often wonder how many thousand per cent. of profit, in pleasure, we have derived from our outlay in that little canvas boat from Ohio. Scarcely ever have we had an expedition that was not marked in one way or another, by some pleasant or humorous incident. I have often dreamed of it, when half asleep, that it was dangerous, and partly concluded never to venture in it again, but somehow when the resolution is broken, like a temperance pledge, and I am afloat again, all fear vanishes, especially when reeling in a stubborn and unreasonably obstinate 3-pounder. On one occasion we had a novel and strange experience with loons. It was on a small, lonely lake, far from the highway and fringed with lordly spruce and hemlock. The great birds would dive and often reappear right under our rods, frightening us every time with a great sudden, startling splash, the young coming quite close to the boat apparently bewildered and then, with lightning motion, again disappear. Many times this was repeated till we tired of the fun and left them unmolested at the further end of the lake.

In the vicinity of some of these fishing spots for sea trout along the eastern shore of Nova Scotia, every prominent point and many a sunken ledge has its story to tell of shipwreck and disaster. Hereabouts, although many a lighthouse throws its warning light far over the ocean, many fine ships have found a grave and many a brave seaman a tomb. The coast lies near the track of ocean steamers, and will be fraught with interest so long as the sea remains the highway between the old world and the new. At Cape Canso, including Hazel Hill, there is an aggregation of ocean cables, forever transmitting their electric signals from many distant points, which distinguishes it as the largest cable station in the world, while its own geographical position must ever single it out as a port of importance to mariners that can scarcely be overestimated. Connected with all parts of the world, many ships call here for orders. In fogs and at night along the coast many shipwrecks occur, and in the early morning some fisherman may come across the fragment of a broken wheel, the shred of a sail, the splinter of a mast, or perhaps the mangled remains of a human form tangled with the seaweed and shingle of the shore, which tells the gruesome tale. Once a body was found near a village on the eastern shore in this way, bearing evident marks of high attainments in Free Masonry. Those of the order in that quiet place gave it a decent burial associated with their solemn rites. It was afterwards found that the remains were those of a master of a gallant ship from the shores of England, high in the mystic art, and from his mother lodge, in due time, came the thanks across the sea for the kindness done. A trip along the coast hereabouts, at the proper time, fishing here and there as one would go, would be sure to afford a splendid outing and excellent fishing. Sometimes on the little streams inland, sometimes at the head of some long inlet, sometimes by the seashore, sometimes by some quiet, still water not far from the ocean, and maybe a visit to a neighboring lake, would fill the time with variety and pleasure. There would undoubtedly be some strong contrasts, and if the traveler would invite the recital he would be sure to hear, in rough but graphic words, from the honest toilers of the fishing boats, tales of noble endurance, and rescue, perhaps of suffering and death. He might be fortunate enough to witness in all its grandeur, as I have done from a lofty headland, one of those terrible storms which come up so suddenly along the coast and rouse to seeming madness and tumble against the bulwarks of a continent with fierce immeasurable force, the waters of the Atlantic.

Many of the fishing resorts here spoken of can now be more easily and readily reached, and more comfortably, than some years ago. Within the past few months the railway facilities in Cape Breton have been greatly extended, and now one can go via the Grand Narrows, on the Sydney line, and reach easily by carriage the Margaree and other streams. Or he can, if he choose, go by rail all the way to Broad Cove from the Straits of Canso, via Port Hood, up the western side of the island, and be within easy reach of many fishing resorts. These comfortable traveling facilities will be sure, year by year, to cause an increasing influx of sportsmen to this favored land of fishing coves and streams, and lakes, and where the heat of summer is always so finely tempered by the ocean breeze carrying over the country its sweet invigorating air.

St. Lawrence Anglers.

THE twentieth annual meeting of the Anglers' Association of the St. Lawrence River, which was held at Hotel Lotus, St. Lawrence Park, Wednesday, August 5, was attended by upward of one hundred members. The assemblage was called to order by Second Vice-President Charles R. Skinner, of Albany, in the absence of the president and first vice-president. T. B. Kerr, of Englewood, N. J., was appointed temporary secretary. Vice-President Skinner made a brief but interesting address. He thought the Association ought to congratulate itself upon the result of its labors in behalf of fish protection. He spoke of the lands provided by the State for the use of campers at the Thousand Islands. They are very beautiful, and ideal spots for camping purposes. It was the opinion of the speaker that there ought to be some legislation each year to provide for clearing off the underbrush and caring for these camping grounds.

Secretary W. H. Thompson, of Alexandria Bay, presented his annual report, in which reference was made to the subject of duck shooting and other matters. He called attention to the fact that spring shooting had been prohibited throughout the State. Through the influence of the Anglers' Association an appropriation of \$3,000 has been made to furnish the game commissioner with a patrol boat and carbage cans for the refuse of picnic parties on the State lands. The Anglers' Association has a membership of 250.

It was decided that efforts should be made to restrict duck shooting to four days in the week during the open season in order not to scare the birds permanently away from any locality.

Treasurer R. P. Grant, of Clayton, spoke in regard to the licenses charged by so-called Canadian game protectors for Americans fishing in Canadian waters. He spoke particularly of a guest at the Frontenac Hotel, who was fishing between Gananoque and Kingston, and was accosted by a man who wanted \$5, which was promptly paid. W. H. Thompson, C. E. Britton, and Gen. Van Patten were named as the committee to look into the law on the subject.

The annual report of Treasurer Grant showed a balance on hand of \$447.61.

The following officers were elected for the ensuing year: President, Hon. Charles R. Skinner, Albany; First Vice-President, Alexander Robb, New York; Second Vice-President, T. B. Kerr, Englewood, N. J.; Secretary, W. H. Thompson, Alexandria Bay; Treasurer, R. P. Grant, Clayton; Executive Committee: A. C. Cornwall, Alexandria Bay; F. H. Taylor, Philadelphia; A. E. Clark, Chicago; C. W. Crossmon, Alexandria Bay; G. T. Rafferty, Pittsburg; George C. Boldt, New York; Col. O. G. Staples, Washington; T. A. Gillespie, Pittsburg; C. E. Britton, Gananoque, Ont.; C. G. Emery, New York; W. H. Nichols, Walter Fox, J. D. Cole, Alexandria Bay.

President Skinner thanked the Association for the honor conferred on him. He spoke of the great interest which he takes in the Thousand Islands and said he would do all in his power to promote the welfare of the Association.

Treasurer Grant stated that last year ten cans of muscallonge fry were received, 25,000 in a can, which were distributed around Clayton and Alexandria Bay.

It was the unanimous opinion of the meeting that Mrs. E. H. Hubbard, of Clayton, the only lady member of the Association, should be made an honorary member.

Letters were read from Governor Odell, S. T. Basted, F. H. Taylor and Robert B. Lawrence, President of the New York State Fish, Game and Forest League.

The executive committee was empowered to make arrangements for a committee to appear before the State Legislature in the event that such action should be deemed necessary. A resolution was adopted to the effect that about \$1,000 of the \$3,000 appropriated for the benefit of the river region be set aside to purchase a patrol boat, to be used by the protectors of the State reservation exclusively in the interests of the State and for game protection.

The members of the Association who died during the past year were: C. H. Eaton, New York; H. F. Inglehart, Watertown; J. C. Spencer, New York; N. W. Hunt, Brooklyn; E. W. Dewey, New York; Hugh Mellon, Clayton; Jacob Hayes, New York; Theodore Scott, New York; J. G. Baker, Pittsburg. Appropriate resolutions of respect were adopted.

It was decided that the next annual meeting should be held at the Murray Hill Hotel. Adjourned. At the conclusion of the meeting a banquet was enjoyed. Subsequently the members of the Association were received at the summer home of President Skinner.

Mont Pelee's Obelisk.

FRESH from what he terms the most wonderful spectacle nature has ever presented, Prof. Angelo Heilprin is back in Philadelphia after a two months' visit to Mont Pelée on the Island of Martinique.

"The distinguishing feature of Mont Pelée," he says, "and that which makes this volcano unique among the volcanoes of the world, is the giant tower or obelisk of rock which is being extruded from the summit of the newly made cone, which obelisk now rises up in supreme grandeur over 5,000 feet high and almost vertically 840 feet above the summit of the cone proper, with a thickness at the base of from 300 to 350 feet.

"Looking at this obelisk of solid lava from the rim of the crater as I did at the time of my latest ascent of the volcano on June 13, the scene that presented itself was of unequalled grandeur, and having fully in mind the grand scenes of nature that I have already witnessed, the Alps, the Grand Cañon of the Colorado, the Yosemite, and the great ice fields of the Arctic North, it seems to be well within the truth to say that this scene surpasses all others.

"One can form no conception of its magnificence and terrorizing aspect. The old summit of Mont Pelée, which was rounded and about 4,000 feet high, is now overtopped by this new creation by nearly 1,000 feet, so that the apex of the volcano, which surpasses the old dome, is found at a height of 5,200 feet above the sea, and the cone, together with its surmounted obelisk, has still surrounding it a crater basin of about 300 feet depth, over which great puffs of steam and sulphur vapor are being emitted, showing that the activity of the volcano is not yet still.

"The appearance of this obelisk or monument on the summit of the volcano, transfixing its cone and virtually blocking it, is no less remarkable than the conditions which are involved in its making. There is no question of doubt that the entire mass, rising to twice the height of the Washington Monument at Washington, with four times its thickness, is being pushed up bodily, and has been pushed out in this manner to its full present height.

"The volcanic stress that has lifted it is the same which in other volcanoes ejects flowing lava, but in this particular instance the molten matter within the volcano has hardened before it has left the lip of the crater, and comes out as a united solid. Hence the lava instead of overflowing simply mounts up higher and higher into space.

"To what extent this head may still be carried in the future it is impossible to say. The aspect that is now presented is one that is unique in the history of volcanoes, and it itself will tell in weeks or months to come what the possibilities of this new form of construction or new type of activity may be.

"This vast obelisk, which gives the appearance as seen from St. Pierre of a monument erected by nature to the dead is slightly arched or curved in the direction of the destroyed city. On the opposite side it arises with a well-nigh vertical face and presents a perfectly smooth, almost polished surface, made so and grooved as the result of hard pressure against the casing of the wall of rock which borders its channel of exit. The surface indeed recalls to the geologist the appearance of horizontal rock masses that have been polished and curved as the result of glacial action.

"On May 31, when the volcano lost nearly 200 feet of its summit, the apex reached the 5,200 feet. At the present time it rises slightly above 5,000 feet. On the four days preceding June 17, the rise of the tower was 21 feet, but in the early period the extrusion was nearly twice as rapid. On the day preceding my departure a faint line of steam was seen issuing from the absolute apex, showing the fissures and passages that exist within the mass which permit the interior steam to travel through completely from the base to the summit."—Philadelphia Press.

Books and Trees.

THE newspaper tales of the enormous editions of historical novels are by no means as fantastic as they may read. A list, carefully compiled from publishers' returns which are absolutely without reproach, shows that the sales of nine recently-published novels have reached astounding proportions. Of one book, over 400,000 copies have been sold. Another is in its 325th thousand. Less successful books have attained only a paltry sale of 100,000, while a few minor ones hardly exceed a disappointing 80,000.

Books are made of paper. Paper in turn is made of cellulose, of which the chief source of supply is timber. In order to describe the romantic career of a seventeenth century gentleman of the rapier, it is necessary to fell a few hundred trees; the publication of many narratives in which the exploits of other cavaliers are dwelt on, may therefore entail the destruction of a forest.

The nine novels to which we have referred had a total sale of over 1,600,000 copies. Since the average weight of each book sold was probably twenty ounces, a little calculation will prove that these 1,600,000 books contained approximately 2,000,000 pounds of paper. We are assured by a manufacturer of paper that the average spruce tree yields a little less than half a cord of wood, which is equivalent to about 500 pounds of paper. In other words, these nine novels swept away 4,000 trees, and they form but a small part of the fiction so eagerly read by the American public. Some books are worth more than 4,000 trees. What may be the tree-value of the modern historical novel it is not within our province to decide.—Scientific American.

MR. HOWARD P. FROTHINGHAM writes to correct a statement made to the effect that a six-pound bass taken at Lake Hopatcong excels the record formerly held by him. "On September 16, 1888," he states, "I caught two black bass, one weighing 7 pounds 2 ounces and the other 6 pounds 7½ ounces. These two fish are mounted, and can be seen at any time at my residence."

Canine Elegies and Epitaphs.

XXXVI.—Pup.

THE following "Tribute to Pup" was sent to FOREST AND STREAM by the late Senator Kenna, of West Virginia, who was an enthusiastic sportsman, an angler, shooter and fox hunter.

House of Representatives,
Washington, D. C.

Editor Forest and Stream:

The following tribute to a faithful hound may not be deemed unworthy of a place in your columns. The soubriquet, "Pup," began with him, and ended with him. I never knew a better dog. His achievements were among the hills and in the woodland range along the valley of the beautiful Kanawha. Many were the foxes that surrendered to the fleetness of his foot and the unerring certainty of his nose. We have some good dogs—he was the greatest Roman of them all. A pair of his youngsters promises the early adornment of my small pack, and a strain of his blood is prized above anything our section can boast:

Hear! all ye lovers of the chase,
Who follow black, tan, pied, or red,
The best and noblest of his race,
The Prince of dogs, old "Pup," is dead!
No more will Joppling's echoes ring
His accents clear at early morn;
No more his eyes will brightness bring,
Responsive to Lan Oakes' horn;
Van Buren's voice on the hilltop high,
May greet the Nimrod in the chase,
Delaney's yell from mountain nigh,
Give cheer and relish to the race;
From Mathew's Branch to old Stittfield,
Red fox or gray may frequent go,
With foot or ken that ne'er did yield
To man or dog, nor fast nor slow.
The old peach orchard on the hill,
May, listening, hear the opening pack;
The laurel hollow o'er the rill,
Resounding, give the echoes back;
Jeff, Plunder, Crowder, and the rest,
With Steptoe's shout, may mingle sounds,
While Fleet and Watkins, with a zest,
Make rapid pace with fox and hounds.
Like hurricane or cyclone driven,
By measureless, eternal wrath,
With lightning's flash, in bounty given,
To illuminate the reckless path,
The eager pack may sweep the plains,
As swift as wings of love or light,
The fearless horseman loose the reins,
And lash his charger on to "sight."
But never over log or rail,
Will fox evade, or dog pursue,
A quicker or a colder trail,
Than, wind or storm, old "Pup" would do.
No pointer he, nor setter sly,
To steal on unsuspecting prey—
But loud he raised his battle cry,
A warning, as he sought the fray.
Descended from an ancient brood,
Unflinching, bold, he stood the test;
He vindicated royal blood,
Nor found his peer among the best.
His voice was music on the air,
As he through mazes fast did wind;
His nose wrought out the hidden lair,
His foot left hills and rocks behind;
His "bottom" never knew a flag,
In mountain, thicket, heath or vale,

By deepening gorge or lofty crag,
He followed, fate-like, on the trail.
Now, all ye hunters, mark the spot,
Where lies the friend who served you well,
In chase, or out, forget him not!
He stood by you until he fell.
His life was long, his labors hard,
"Mong men" he never owned a foe;
He leaves a fame no blemish marred,
He's gone where all the good dogs go.
J. E. K. (W. Va.)

Dogs in Fiction.

ALTHOUGH it may be conceded that among the animals of fiction the horse holds first place, the part played by dogs, especially in modern literature, is very large and important. The pages of many famous novels have presented us with members of the canine race as carefully drawn and as lovingly delineated as any of the human characters introduced. Not infrequently the role of hero or heroine is doubled with, or wholly supported by, a dog; and in numberless instances it is an intervention, conscious or unconscious, of a dog upon which the whole plot turns. As might be expected, it is among the works of such novelists as are specially noted as dog lovers that the finest and most frequent descriptions of their four-footed friends are to be found; and naturally Sir Walter Scott, well known for his extreme attachment to dogs, heads the list.

Big dogs are Scott's special favorites, and his noblest example is Sir Kenneth's hound Roswal, who bears an all important part in the plot of "The Talisman." Roswal is described as a large stag hound of splendid proportions and great sagacity, who shares his master's watch on St. George's Mount beside the banner of England, above the camp of the Crusaders. Tempted by woman's guile the knight forsakes his post for a short space, leaving Roswal to guard the flag. A base attack is made in his absence, and Kenneth returns to find the flag gone, and its faithful defender wounded apparently to death in its defence. Kenneth's remorse for the violation of the English banner is scarcely more keen than his grief over the dog, who wags his tail and licks his master's hand even in the agonies of death. It is a most touching scene, drawn by a master hand, and the reader's satisfaction is not less than the knight's is represented to be when the Arabian physician, Saladin, disguised, appears opportunely, and by his timely ministrations saves the hound, who lives to identify his till then unknown assailant by dragging him bodily from his horse. In "Ivanhoe," Gurth, the swineherd, possesses a noteworthy dog, Fangs by name, "a rugged wolfish-looking dog, a sort of lurcher, half-mastiff, half-greyhound," who assists his master in the care of his refractory charges, is wounded by Cedric the Saxon, and whose adventures are carried on throughout the book.

In "Woodstock," again, Scott draws with loving touch the portrait of Sir Henry Lee's famous mastiff Bevis, who in the first scene accompanies the knight to church, where, "bating an occasional temptation to warble along with the accord, he behaved himself as decorously as any of the congregation, and returned as much edified, perhaps, as some of them;" who had, moreover, saved his master's life, defended his daughter Alice from assault, and fastened his teeth into the sacred person of King Charles II. when the disguised monarch was seeking refuge in Woodstock Lodge. Among Scott's dogs mention must needs also be made of the famous breed of pepper-and-mustard terriers described in "Guy Mannering," and which have ever since borne the name of their immortal owner, Dandie Dinmont. "I have six terriers at home, forebye other dogs," said that worthy. "There's Auld Pepper and Auld Mustard, and Young Pepper and Young Mustard, and Little Pepper and Little Mustard. I had them a' regularly entered, first wi' the tods and brocks, and now they fear nothing that ever cam' wi' a hairy skin on't."

Dickens was a dog lover, and possessed several dear canine friends. It is recorded in his biographies how greatly moved he was on one occasion by the sympathetic concern evinced by two of his favorites, Turk and Linda, when during a walk he was suddenly struck with lameness. Boisterous companions as they always were, the sudden change in him caused them boundless distress, and for the rest of the journey they crept by the side of their master as slowly as he did, never turning from him. The finest dog character in Dickens's novels is undoubtedly Diogenes, the favorite of little Paul Dombey, and subsequently presented by Mr. Toots to his sister Florence. "As ridiculous a dog as one would meet with on a summer's day; a blundering, ill-favored, clumsy, bullet-headed dog, continually acting on a wrong idea that there was an enemy in the neighborhood whom it was meritorious to bark at." Nevertheless, despite his peculiarities, his "habit of carrying his tongue out as if he had come express to a dispensary to be examined for his health," his falling upon the man servant, "mortally convinced that he was the enemy whom he had barked at round the corner all his life and had never seen yet," Diogenes is a most estimable animal, and holds our affections till the end of the book.

Not so Dora's little dog Jip in "David Copperfield," a spoiled lap dog drawn to the very life, whose most meritorious action is his pathetic death at the moment when his foolish, fascinating mistress, Copperfield's "child wife," breathes her last. Then there is Sikes's dog in "Oliver Twist," "white and shaggy, with red eyes, and his face scratched and torn in twenty different places," continually kicked and beaten and half killed by his ruffian master, but who clings to him with dumb fidelity through all, and in the last scene, when the fugitive murderer hangs himself from the roof of the house, perishes in a wild attempt to reach his body. Reference is also owing to the performing dogs in "Old Curiosity Shop," one unhappy member of which troupe of artists being unlucky enough to lose a half-penny during the day is denied his supper and obliged instead to grind mournful music out of a barrel organ "sometimes in quick time, sometimes in slow, but

never leaving off for an instant," while watching with despairing eyes his companions at their meal. Lovers of "Pickwick" also will recall Mr. Jingle's celebrated "Ponto," described by his master in characteristic fashion—"Pointer—surprising instinct—shooting one day—entered enclosure—whistled—dog stopped—whistled again—Ponto! Ponto!—no go—stock still—would not move—staring at a board—Gamekeeper has orders to shoot all dogs found in this enclosure—would not pass it—valuable dog that—very."

Thackeray, however, makes little use or mention of dogs. George Eliot also lays no great stress upon them, though Adam Bede has a faithful friend in Gyp, a gray sheep dog, and Bartie Massey a brown and tan bitch, Vixen, whom he refers to contemptuously as a woman. "Where's the use of talking to a woman with babies? She's got no conscience, no conscience—it's all run to milk." Lytton makes great capital of the performing poodle, Sir Isaac, alias Mops, in "What will He do with It?" and Bran, the huge British mastiff, is an all important character in Kingsley's "Hypatia," where she plays no small part in the redemption of the young Jew Raphael Aben-Ezra. There is a dog incident in "Yeast," and a dog in the "Water Babies," who was a real dog on a ship once till he fell overboard into the sea, where he "kicked and sneezed so hard that he sneezed himself clear out of his skin and turned into a water dog, and followed Tom the whole way to the Other-end-of-Nowhere." Such a keen sportsman as Whyte Melville was sure to introduce a dog into his novels, and there is no more touching or beautiful story in all fictional dog annals than is to be found in "The Interpreter." One of Captain Marryat's best tales, "The Dog Fiend," is, as its title reveals, entirely about a dog, an ill-omened cur rejoicing in the appropriate name of "Snarlyow;" and Bronte lovers will not need reminding of the dog in "Shirley," or of Rochester's dog in "Jane Eyre." Coming to living authors, we may instance Conan Doyle's "Hound of the Baskervilles," Anstey's "Black Poodle," and Ollivant's "Owd Bob," as playing title roles in their own annals. Kipling has several dogs in his stories, notably Tietjens in "The Return of Imray," and Binkie in "The Light that Failed." Miss Fowler, Miss Cholmondeley, Stanley Weyman, Seton, Merriman, and other authors have written of dogs too numerous to mention; though special reference is surely merited by Montmorency, whose presence added so greatly to the remarkable adventures of "Three Men in a Boat."—London Standard.

Bloodhound and Mastiff.

I YIELD to Mr. Shurter. I said, "I might be wrong," and find I was by looking at an old folio edition of Johnson's Dictionary which belonged to my grandfather one hundred years ago. I do not know where I got the impression of the mastiff, and am glad to have it corrected.

VON W.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days.

AUGUST.

12. Misery Island, Y. R. A., open, Salem Bay.
- 12-15. Atlantic, race week, Sea Gate.
13. East Gloucester, Y. R. A., open, Gloucester.
- 14-15. Annisquam, Y. R. A., open, Annisquam.
- 14-15. Southern, Southern Gulf Coast Y. A., New Orleans, La.
15. Beverly, fifth Corinthian, Monument Beach.
15. Penataquit Corinthian, special, Bay Shore.
15. South Boston, club, City Point.
15. Horseshoe Harbor, Y. R. A. of L. I. Sound, annual.
15. Moriches, special.
15. Huntington, Y. R. A. of L. I. Sound, annual.
15. Seawanhaka Corinthian, club, Oyster Bay.
15. Eastern, Marblehead to Gloucester.
15. Corinthian, fourth championship, Marblehead.
15. Royal Canadian, club, Toronto.
15. Chicago, special, Lake Michigan.
15. Savil Hill, club, Dorchester Bay.
15. Hartford, Y. R. A. of L. I. Sound, special.
16. Williamsburg, ladies' day.
17. American, Y. R. A., open, Newburyport.
17. New York, autumn cups, Glen Cove.
19. Moriches, ladies' regatta.
- 20-22. Duxbury, Y. R. A., open, Duxbury.
20. First America's cup race; balance of races to be sailed on alternate days, Sundays excepted, until result is determined.
22. South Boston, club, City Point.
22. Southern, Rawlins, Tranchina and Olivieri cups, New Orleans.
22. Corinthian, fifth championship, Marblehead.
22. Royal Canadian, club, Toronto.
22. Chicago, special, Lake Michigan.
- 24-25. Wellfleet, Y. R. A., open, Wellfleet.
26. Moriches, McAleenan cup race.
- 27-29. Columbia, Lipton competitive cup races, Chicago, Lake Michigan.
- 27-29. Cape Cod, Y. R. A., open, Provincetown.
29. Seawanhaka Corinthian, club, Oyster Bay.
29. South Boston, club, City Point.
29. Chicago, special, Lake Michigan.
29. Beverly, sixth Corinthian, Monument Beach.
29. Royal Canadian, club, Toronto.
29. Corinthian, sixth championship, Marblehead.
29. Savin Hill, club, Dorchester Bay.
29. Huguenot, Y. R. A. of L. I. Sound, annual.

SEPTEMBER.

1. Chicago, special, Lake Michigan.
- 4-5. Eastern, open, Marblehead.
5. Seawanhaka Corinthian, club, Oyster Bay.
5. New York C. C., Y. R. A. of Gravesend Bay.
5. Royal Canadian, cruising race, Toronto.
5. Southern, Fornaris cup, New Orleans.
5. Indian Harbor, Y. R. A. of L. I. Sound, fall regatta.
5. Eastern, special, open, Marblehead.
5. Chicago, special, Lake Michigan.
5. Columbia, cruise to Indian Harbor.
5. Hempstead Bay, open.
5. Penataquit Corinthian, special, Bay Shore.
5. Beverly, open, Mattapoisett.
7. Indian Harbor, club, Greenwich.
7. Beverly, open sweepstake, Monument Beach.
7. Atlantic, club, Sea Gate.
7. Moriches, annual, open.
7. Seawanhaka Corinthian, club, Oyster Bay.
7. Jamaica Bay Y. R. A.
7. Larchmont, fall regatta, Larchmont.
7. Lynn, Y. R. A., open, Nahant.
7. Williamsburg, cruise.
7. Norwalk, Y. R. A. of L. I. Sound, annual.
7. Sachem's Head, Y. R. A. of L. I. Sound, annual.

7. Penataquit Corinthian, open, Bay Shore.
- 9-11. Columbia, races for Webb cup, Chicago, Lake Michigan.
- 10-12. Seawanhaka Corinthian, Y. R. A. of L. I. Sound, specials, and fall regatta.
12. Keystone, open, Woodmere, L. I.
12. Beverly, seventh Corinthian, Monument Beach.
12. Bay State, Y. R. A., open, Lynn Bay.
12. Chicago, handicap race to Kenosha.
12. Columbia, fall regatta, open, Chicago, Lake Michigan.
12. Royal Canadian, Prince of Wales cup race, Toronto.
19. Chicago, special, Lake Michigan.
19. Seawanhaka Corinthian, club, Oyster Bay.
19. Larchmont, schooner cup race, Larchmont.
19. Atlantic, fall regatta, Sea Gate.
19. Bensonhurst, Y. R. A. of Gravesend Bay.
19. Manhasset Bay, Y. R. A. of L. I. Sound, fall regatta.
26. Riverside, Y. R. A. of L. I. Sound, fall regatta.
26. Seawanhaka Corinthian, club, Oyster Bay.
26. Chicago, handicap, Lake Michigan.
27. Williamsburg, open, fall regatta.

OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.
3. Columbia, special, Lake Michigan.
5. Southern, fall, New Orleans.
10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

DAILY spins took place last week at Newport between Reliance and Constitution. There were no real races between the two boats, the idea being simply to see how Reliance performed with Constitution when slight changes were made in her trim. On Saturday the boats met for the last time, the owners of Reliance feeling perfectly satisfied that the boat was in the best possible trim and further trials or changes in the boat unnecessary. In almost every trial Constitution would start ahead and to windward of Reliance, but before they would cover any distance the new boat would work through her lee, cross her bows and then outpoint and outfoot Constitution. The weather conditions for the trial on Saturday were perfect, the sea being smooth, and there was just wind enough to heel the boats down to their rails. A start was made off Brenton's Reef Lightship, and in the beat out to the whistling buoy, off Point Judith, Reliance beat Constitution 4m., outpointing and outfooting her on this occasion, as she had done on all others.

After having seen Reliance in almost every race she has sailed in since she was launched, we are more satisfied now than ever that the Cup is absolutely safe. While we do not wish to underestimate the speed of Shamrock III., we shall be surprised if she takes even one race.

Mr. August Belmont did a very courteous and sportsmanlike thing when he practically turned Constitution over to be used as a trial boat for Reliance. He undoubtedly had hopes of defending the Cup this year and he spent a large sum of money preparing Constitution for the races. He has had a season of continued hard luck, Constitution having been "hoodooed" from the start, and her frequent accidents having caused many disappointments, both to the boat's owner and to her many admirers. Constitution's double spreaders were the cause of many mishaps, and had they been discarded at the first of the season she would have shown up to much better advantage, although it is not likely she would have beaten Reliance. The double spreader was found to be a failure in small boats years ago, and why the contrivance should have been tried in a ninety in the second season after it was found unsatisfactory in the first is a mystery.

The two Shamrocks met in their last trial before the Cup race last Saturday. The trials between the two boats here have been of a doubtful nature as those held on the other side. Although the daily papers have devoted columns to the races between the two boats, no one really knows whether the challenger is five, ten or fifteen miles faster than Shamrock I. over a thirty-mile course. There is no doubt that Shamrock

III. is faster than the old boat, but just how much faster we don't know nor do we know in what shape Shamrock I. is sailing. We hope she is sailing faster than she was when she was on this side before, in which case the challenger will be more nearly in Reliance's class.

Sir Thomas and Mr. Fife made up their minds to keep those on this side as much at sea as to the real merits of the challenger as possible, and they have succeeded to a marked degree. They may know how much faster Shamrock III. is over Shamrock I., but no one else does. From the time the boats began sailing on this side, they have been experimenting with the new boat. After every race a change would be made in her trim, her spars or her sails. Then, again, every day or so she would be towed up to Erie Basin, where she would go in the dry dock and have her bottom cleaned or else a longer mast or bowsprit would be stepped. The fact that constant and radical changes were continually being made was evidence that the boat was not satisfactory to her designer. Had she been as perfect and wonderful a creation as they have claimed, she would never have been tampered with for fear of throwing something out of perfect tune. Shamrock III. is again in Erie Basin, where her bottom is being cleaned and painted. On Tuesday she will be measured by Mr. Charles D. Mower, the New York Y. C.'s official measurer.

We are almost on the eve of the races, Aug. 20 being the date of the first race. Good breezes have been predicted for the races, and we hope this may prove true. A race in a breeze and a sea is more exciting, but as far as the result of the contests go, we care little how it blows, whether it be a light breeze just enabling the boats to finish within the time limit or a half a gale. In any case, all the signs point out Reliance as the winner.

The Canadians at Toronto seem to be quite as invincible as those at Montreal when it comes to the building and sailing of racing yachts and the defending of cups. The Canada's Cup challenger, Irondequoit, has been defeated in two straight races by Strathcona, the defender. The first race was sailed on Saturday over a triangular course, and the defender won by a narrow margin, but in the windward and leeward race sailed on Monday Strathcona beat Irondequoit by over rom. The reports state that the splendid showing the Canadian boat made was in a great measure due to superior judgment and handling.

The Canada's Cup Races.

TORONTO, Aug. 8.—The first of the races for the possession of the Canada's Cup, the blue ribbon of the lakes, was enough to drive a man to the verge of nervous prostration. Lake Ontario has never seen a closer contest, although it has seen a closer finish occasionally. But in all of the twenty-one miles of sailing the contestants were never much more than a hundred yards apart, and for the greater part of the race they were so close together that the tossing of the traditional biscuit would have been unnecessary, for a man could have jumped from one to the other.

The race was full of chances from one end to the other, and there was no certainty as to the winner until the final gun fire. The excellent performance of the American boat was no surprise to the Canadians. Their marine soothsayers and waterfront seers had spoken solemn words of warning from the moment of Irondequoit's arrival in the harbor, and after the challenger had been hauled out it was very difficult to find any money on the defender at even prices. The Canadians, without looking down in the mouth, were prepared for a defeat, perhaps not in the whole series of races, but at least in one race. And when victory perched on their burgee their pent-up feelings were unable to find intelligent utterance.

There are sixty-four compass courses worked out for the Canada's Cup races, each one giving an equilateral triangle. Many of these are not feasible with the start made on the south shore of Toronto Island, but after eliminating these the judges, Messrs. Oliver Cromwell, of New York; Frank T. Christie, of Rochester, N. Y., and E. H. Ambrose, of Hamilton, Ont., have still a plentiful field to select from. Course No. 41 was given the yachts on Saturday, with instructions to leave all buoys to port. The compass course was southwest, then east-southeast, half east; then north by west half west. For the Canada's Cup, the courses are alternately triangular and windward and leeward, the former being twenty-one miles in extent, and the latter eighteen. The winning of three out of five races determines the fate of the precious trophy. There is no question of time allowance, and the time limit is five hours and a half. For Saturday's race there was a splendid southwest breeze, steady and not too strong, holding between ten and twelve miles an hour, and not varying in direction except on the last leg of the triangle. It was a brisk breeze without much weight in it, a breeze that decorated the sky with fleecy clouds that did not interfere with the sun, and a breeze that rolled up the waters of the lake into a lumpy, tossing mass without producing what could properly be called a seaway.

The judges started out in the steam yacht *Tranquilo*, owned by Mr. Fred. Nichols, of Toronto. The wobble of a sea had displaced one of the L. Y. R. A. buoys left out overnight, but the tug *Alert*, in charge of the buoys, had no trouble in placing them in their proper positions and keeping them there as long as they were needed. The *Tranquilo*'s machinery became deranged before the day was very old, and the judges were transferred to the steam yacht *Winyah*, of Alpena. The *Tranquilo*, however, was the official boat at the start. Later she was towed in by the Gooderham steam yacht *Cleopatra*.

The first gun was given at 10:33 A. M. The yachts were then dodging about under lower canvas and No. 1 clubtopsails, with jibtopsails in stops. The maneuvering for position was not very spectacular. The skipper were new to one another, and neither seemed to

be very desirous of close quarters. The yachts spun around each other like a pair of dancers, occasionally, but this was not right on gunfire. When the gun was given at 11:03 A. M., they were both close on the line, but far enough apart to make the start a plain piece of sailing. Irondequoit crossed first, at 11:03:09, Strathcona being 6s. behind, at 11:03:15, but slightly to windward. They went over on the starboard tack and showed no disposition to indulge in a stick-handling display. They stood off to the southward on one long stretch, which was probably to Strathcona's advantage, for she is at least a second slower in stays than Irondequoit. The best I have ever seen her do is 8s. from full to full, and Irondequoit can do it in 7s., so that a series of short hitches might have given the challenger an advantage, although, as the leading boat, Irondequoit was quite right in holding the starboard tack as long as she was nearer the buoy than Strathcona. Strathcona stood up a trifle better, and ate to windward steadily. Irondequoit, however, footed just a little faster.

At 11:27 Irondequoit came about on the port tack. She was then ahead of Strathcona, but not enough. Skipper Jarvis was not the man to neglect the advantages of the starboard tack, and Skipper Barr realized in a flash that there would be a foul and disqualification in a second or so. Down went his tiller, and while Irondequoit hung in the wind, Strathcona forged ahead. Irondequoit swung off on the port tack again, and Strathcona did likewise, the whole maneuver only occupying 30s.

Just after settling down to business again, the shackle on Irondequoit's jibtopsail sheet parted, and the big sail had to be lowered. It was only off for a minute, but Strathcona stretched out a lead of a couple of lengths. When the yachts came about again, rom. later, Strathcona had four lengths to the good. Irondequoit had shackled on her jibtopsail sheet in very quick time, but she had lost some. The boats laid the buoy on the next port tack, a long one. Irondequoit's footing very nearly made up for Strathcona's eating to windward, for the latter only rounded the buoy 22s. in the lead, after seven miles of sailing.

It was a pretty reach to the next mark, under balloon jibs, and largest jibtopsails. Irondequoit set a new wrinkle by taking in her jib altogether, so as to allow her balloon canvas to draw. For a long time Strathcona held her lead. Then in the seventh mile Irondequoit overhauled her, and once she had her blanketed, passed her like a shot out of a gun. This was close on the second buoy, and the turn was made with Irondequoit 14s. in the lead, having gained 36s. in seven miles of reaching. Then came the smart work. It was a reach again home, but the wind backed to the southward a trifle. Skipper Jarvis dowsed his big jibtopsail and set a balloon jib, but very slowly, Strathcona being without a kite forward for 2m. But the balloon pulled, and rom. after turning the buoy Strathcona's spinnaker was fluttering out of stops. Skipper Barr at once sent out his spinnaker in stops, but it was 3m. later when he broke it out.

But Jarvis was after him. Inch by inch Strathcona crept up. The southwesterly roll caused the yachts to sway heavily at times, and when Strathcona interfered with Irondequoit's wind, the spinnaker boom cock-billed itself. Skipper Barr luffed, to jump Irondequoit to windward of her overtaker, and the big sail collapsed in tangled flutters, hanging in bight around the headsails. But Skipper Jarvis also luffed and held his weather berth. His spinnaker would no longer draw, but with lightning speed the clew was unspun and hooked on to the forestay, and the great piece of silk hung there, dragging nobly, a second balloon jib. Irondequoit made frantic efforts to escape the fatal grip, pointing miles to windward of the buoy. But Jarvis stayed with the luffing match, clinging grimly to the weather quarter. Irondequoit's collapsed spinnaker was taken in, and she was shot to windward until her headsails shivered, and then Jarvis, having edged his rival on until Strathcona was actually nearer the buoy, although still astern, put his tiller up. Strathcona leaped across Irondequoit's wake, squaring off for the mark. For an instant it looked as though she would gybe, but the mainsail was left to starboard and the spinnaker again set flying to port. Dead before the wind the defender fled. Had Skipper Barr been quicker he might have repeated the game and blanketed her, but he did not get his spinnaker set for a minute after Strathcona had squared away, and all he could do was to make a close finish, 22s. astern.

Summary of the race:

	First Leg.	First buoy.	Elapsed.
Irondequoit	Start.	12 15 09	1 12 00
Strathcona	Start.	12 14 47	1 11 32
Strathcona gained 28s.			
	Second buoy.		
Irondequoit	1 04 16		49 07
Strathcona	1 04 30		49 43
Irondequoit gained 36s.			
	Finish.		
Irondequoit	2 07 30		1 03 14
Strathcona	2 07 08		1 02 38
Strathcona gained 36s.			

Strathcona won the first race by 22s.

CHARLES H. SNIDER.

Western Yachts.

Beached at Milwaukee.

Lake Michigan is known as a tricky water, and lived up to its reputation this week to the personal concern of some of the Chicago yachtsmen who started out for a little cruise to Milwaukee. Their boats were caught in a sudden lake storm which swept from the anchorage nearly all the boats which were lying back of the breakwater in Milwaukee Bay. Hoosier, Wizard, Widsith, and Outlaw, all of Chicago, went ashore below the Milwaukee Y. C. club house. The bay was pretty well swept clear of all smaller craft, but no damage of serious nature ensued.

All communications intended for *FOREST AND STREAM* should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Boston Y. C.

HULL, MASS.,

Thursday, July 30.

The midsummer series of invitation races of the Boston Y. C. opened at Hull on Thursday, July 30, with a reefing southwest breeze. In the 25-footers, Calypso had the best of the start and led to the first mark. So on after this was passed Sally VII. went up and took the lead, which she held to the finish. In the 22-footers Opitsah V. got the best of the start twice, having waited after the first one to start with Medric, which had trouble with her jib. Opitsah V. led her class all around the course. In the 18-footers Chance led all over the course, with Dominoe a close second. In the first handicap class Jingo won easily. In the second handicap class Jacobin finished first, but lost to Anne on corrected time. In the dory class Lurline II. won. The summary:

Class D—25-Footers—Start, 2:25.
Prizes, \$20, \$10 and \$5. Winner to qualify for a leg for the Lawson cup for her class.

	Finish.	Elapsed.
Sally VII., L. F. Percival	4 16 07	1 51 07
Great Haste, T. K. Lothrop, Jr.	4 16 50	1 51 53
Chewink III., F. G. Macomber	4 20 40	1 55 40
Calypso, A. W. Chesterson	4 21 22	1 56 22

Sally VII. wins by 46s. over Great Haste.

Class E—22-Footers—Start, 2:30.
Prizes, \$18, \$9 and \$5. Winner to qualify for a leg for the Lawson cup for her class.

	Finish.	Elapsed.
Opitsah V., S. H. and H. I. Foster	4 51 12	2 06 12
Chief, S. C. Winsor	4 53 15	2 08 15
Medric, Herbert H. White	4 54 53	2 09 53

Opitsah V. wins by 2m. 3s. over Chief.

Class S—21ft. Cabin—Start, 2:35.
Prizes, \$15, \$8 and \$5.
Perhaps II., J. E. Robinson 4 42 50 | 2 07 50 |

Class I—18-Footers—Start, 2:40.
Prizes, \$12, \$7 and \$5. Winner to qualify for a leg for the Lawson cup for her class.

	Finish.	Elapsed.
Chance, Reginald Boardman	4 25 30	1 45 30
Dominoe, C. C. Clapp	4 27 45	1 47 45
Kittiwake IV., Henry M. Jones	4 28 25	1 48 25
Moslem, B. D. Barker	4 28 29	1 48 29
Aspinquid II., C. M. Foster	4 30 08	1 50 08
Biza, Alfred Douglass	4 30 30	1 50 30
Miss Modesty, B. S. Permar	4 31 05	1 51 05
Question, J. Henry Hunt	4 31 17	1 51 17
Gertrude, Hector E. Lynch	4 31 30	1 51 30
Miladi II., F. R. Adams	4 31 51	1 51 51
Mirage, J. W. Olmstead	4 32 51	1 52 51
Humbug, C. W. Cole and Bacon	4 33 27	1 53 27
Crow, Lauriat & Hooper	4 35 58	1 55 58
Wink, L. B. Goodspeed	4 36 32	1 56 32
Yo San, R. J. Randolph, Jr.	4 38 02	1 58 02

First Handicap Class—For Boston Y. C. yachts only—Start, 2:45.
Prizes, \$12, \$8 and \$5.

	Elapsed.	Corrected.
Jingo, George B. Duane	1 05 54	1 05 54
Helen, Frank R. Neale	1 07 15	1 05 56

Second Handicap Class—For Boston Y. C. yachts only—Start, 2:50.

	Elapsed.	Corrected.
Prizes, \$10, \$7 and \$5.		
Anne, C. B. Pratt	1 13 46	1 07 04
Jacobin, T. W. King	1 07 18	1 07 18
Widow, H. W. Friend	1 10 11	1 07 30
Clarice, Walter Burgess	1 14 00	1 09 41
Janice, J. Fred Harvey and John Sherlock	1 16 53	1 12 12

	Elapsed.
Lurline II., J. P. Meade	1 20 00
Hobo, C. D. Rankin	1 21 55
Vera, H. Lundberg	1 23 13

Friday, July 31.

The second race of the midsummer series of the Boston Y. C. was sailed off Hull on Thursday, July 31, in a wholesail northwest breeze. In the 25ft. class Great Haste had the best of the start, but Chewink caught her on the first beat to windward and took first place, with Great Haste second and Sally VII. third. This order was maintained for the first round of the course, but on the second round, Chewink III. and Great Haste got into a luffing match, and Sally VII. went into the lead, which she held to the finish. In the 22-footers Medric got the best of the start, but Opitsah V. took first place on the first round of the course. On the second round Medric again took the lead and finished a winner. In the 18-footers Patrice got the best of the start, but Dominoe, which was seventh boat, soon went out to the front and led all around the course. In the first handicap class Jingo again won. Jacobin came in first in the second handicap class, but lost to Widow on corrected time. Lurline II. was again a winner in the dory class. The summary:

Class D—25-Footers—Start, 2:25.
Prizes, \$20, \$10 and \$5. Winner and second to qualify for leg in Lawson cups for the series.

	Finish.	Elapsed.
Sally VII., L. F. Percival	4 15 21	1 50 21
Chewink III., F. G. Macomber, Jr.	4 16 17	1 51 17
Great Haste, T. K. Lothrop, Jr.	4 17 17	1 52 17
Calypso, A. W. Chesterson	4 21 55	1 56 55

Sally VII. wins by 56s.

Class E—22-Footers—Start, 2:30.
Prizes, \$18, \$9 and \$5. Winner and second to qualify for leg for Lawson cups for the series.

	Finish.	Elapsed.
Medric, Herbert H. White	4 36 08	2 06 08
Opitsah V., S. H. and H. I. Foster	4 36 49	2 06 49
Chief, S. C. Winsor	4 41 25	2 11 25

Medric wins by 41s.

Class I—18-Footers—Start, 2:40.
Prizes, \$12, \$7 and \$5. Winner and second to qualify for leg for Lawson cups for the series.

	Finish.	Elapsed.
Dominoe, C. C. Clapp	4 32 09	1 52 09
Miladi II., F. R. Adams	4 33 47	1 53 47
Chance, Reginald Boardman	4 34 12	1 54 12
Gertrude, H. E. Lynch	4 34 22	1 54 22
Aspinquid II., C. M. Foster	4 34 46	1 54 46

Lurline II. wins by 43s.

Sunday, Aug. 2.

On Sunday the fleet of the Boston Y. C. sailed as one class from Hull to Marblehead, for a cup donated by the National Sportsman. There was a good breeze, which made the run most interesting. The 22-footer Medric took the lead soon after the start, and held it until port was reached. The summary:

Tuesday, Aug. 4.

An open Y. R. A. race was given by the Boston Y. C. at Marblehead, on Tuesday, Aug. 4. There was a wholesail breeze, which made the racing fast. In the 25-footers, Sally VII. took the lead at the start and held it to the finish. In the 22-footers Opitsah V. was across the starting line first, but Chief pulled out a lead on the first leg and held it to the finish. Arrow got the start in the 18-footers, but Miss Modesty got to the weather mark first. After that there was luffing, and Miladi II. went into the lead, only to lose to Aspinquid just before the finish. The summary:

Class D—25-Footers—Start, 2:25.

	Finish.	Elapsed.
Sally VII., L. F. Percival.....	3 41 58	1 16 58
Great Haste, T. K. Lothrop.....	3 44 06	1 19 06

Indian Harbor Y. C.

GREENWICH, LONG ISLAND SOUND,

Thursday, August 6.

The first of the three days' racing given by the Indian Harbor Y. C. came very near being spoiled by a heavy rain. The bad weather prevented many boats from starting, and only fifteen craft came to the line.

The start was postponed until late in the afternoon, the Regatta Committee hoping the weather might clear. It was nearly five o'clock when the first class was sent away, and the boats sailed over short courses. The breeze was fresh from the E., and the boats made good time. The summary:

New York Y. C.—25ft. Class—Start, 4:50.

	Finish.	Elapsed.
Hope, Adrian Iselin, 3d.....	7 02 07	2 12 07
Lively, C. O'D. Iselin.....	6 56 42	2 06 42

American Y. C. Raceabouts.

	Finish.	Elapsed.
Maryola, C. W. Allen.....	6 42 57	1 42 57
Hobo, T. L. Park.....	6 44 15	1 44 15
Howdy, George Mercer, Jr.....	Did not finish.	

Indian Harbor Sailboats—Start, 5:10.

	Finish.	Elapsed.
Noggin, W. Cooney.....	Not timed.	
Cero, R. Mallory, Jr.....	Not timed.	
Florence, E. J. Marston.....	6 55 11	1 45 11
Stingy, E. E. Zittel.....	7 01 50	1 51 50
Queenie, F. Tilford.....	Not timed.	

Hempstead Harbor One-design Class—Start, 5:10.

	Finish.	Elapsed.
Flicker, C. Handy.....	7 00 58	1 50 58
Scud, D. B. Abbott.....	6 57 41	1 47 41
Gosling, M. and F. Pratt.....	6 55 25	1 45 25

New Rochelle One-design Class—Start, 5:00.

	Finish.	Elapsed.
Knave, R. N. Bavie.....	Did not finish.	
Ace, A. Bavie.....	Did not finish.	

The winners were: Lively, Maryola, Florence, and Gosling.

Friday, August 7.

There were thirty-two starters in the second day of the series racing. All but two of the boats finished. Noggin capsized and was towed into the harbor, while Bobkin split her mainsail and withdrew.

A fresh S. W. breeze held throughout the contest, and the boats made good time over the courses.

Anoatok and Spasm were the only starters in the 36ft. class. These boats were the first to start and were sent away at 3:05. Spasm beat Anoatok by nearly two minutes. This is the first time that Anoatok has been beaten this season.

Hope and Lively, two of the one-design 25-footers designed by Mr. C. F. Herreshoff, started in the 30ft. class. Mimosa, Mr. T. L. Park's Crownshield production of last year, gave them a bad beating.

In the raceabout class nine boats came to the starting line. Hobo, another one of Mr. Park's boats, led the fleet, and won handily, beating Sis, the second boat, by nearly a minute.

Six boats started in the 25ft. sloop class, and among them were two of the Larchmont one-design 21-footers. Robin Hood won easily, beating Dorothy by over four minutes.

Montauk defeated Trouble by nearly six minutes in the 21ft. class.

Stingy beat Florence, the winner of yesterday's race, in the Indian Harbor sailabout class. The summary:

36ft. Class—Start, 3:05.

	Finish.	Elapsed.
Anoatok, W. G. Brokaw.....	4 37 07	1 32 07
Spasm, E. B. King.....	4 35 15	1 30 15

30ft. Class—Start, 3:10.

	Finish.	Elapsed.

Scud, D. Abbott.....	4 53 34	1 18 34
Ity Bity, W. E. Douglas.....	4 49 31	1 14 31

The winners were: Spasm, Mimosa, Hobo, Robin Hood, Montauk, Louie Belle and Stingy.

Saturday, August 8.

The club's annual regatta was sailed on Saturday, August 8, the last of the three days' series races. There was a good list of starters, some fifty boats coming to the line.

The starting line was near the gas buoy off the eastern end of Little Captain Island. The wind was light at the time of the start from the S. by E. In order to give the boats some windward work the Regatta Committee reversed the courses, thus making the first leg a beat. Before the boats reached the first mark the wind shifted to the S. W., making the second leg a run and the last leg a close fetch. On the second round the change in the wind made the first leg a beat with one long leg and a short one, the second leg a run, and the third a close reach.

The 60-footer, Neola, and the 43-footer, Aspirant, were both without competitors, so they were put in the same class. Neola allowed Aspirant full time, and in the light breeze the smaller boat had things her own way, and won with ease.

In the handicap class for sloops, Umbria and Narcissus met; the former boat won by nearly three minutes. Anoatok turned the tables on Spasm and added another first prize to an almost clean record.

The hottest race of the day was between the 30ft. sloops Mimosa and Bobtail. Bobtail is an Atlantic Y. C. boat and has raced only once before on the Sound this season. Bobtail had a comfortable lead on Mimosa, but lost her spinnaker on the second round. This mishap cost her the race, although she was only beaten by 9 seconds.

Three boats started in the C. F. Herreshoff 25ft. one-design class. Hope won, beating Lively by 51 seconds.

Hobo, Mr. T. L. Park's smart little raceabout, took another first prize in her class. She had a big jump on her seven competitors, and beat Maryola, the second boat, by 3m. 10s. Sis carried away one of her chain plates and withdrew.

Robin Hood repeated her performance of the day previous, and took another first prize. When the wind shifted, Robin Hood got badly left while Chingachgook got a big lift. Robin Hood, however, recovered all she lost and won out easily.

Three of the Larchmont one-design 21-footers started. Dorothy won, beating Vaquero, the second boat, by 26 seconds.

Arline had no competitor in the 21ft. catboat class, and withdrew.

In the 18ft. catboat class Louie Belle beat Lobster. Dorothy took a first prize in the 21ft. sloop class. She beat Gazabo and Montauk handily.

Pandora had no competitor in the 18ft. sloop class, and took a sailover.

Three of the Manhasset Bay one-design boats started, and Lambkin won. Arizona was second.

Knave beat her three competitors easily in the New Rochelle one-design class.

Stingy took another winning flag in the Indian Harbor sailabout class, while Wif Waf won in the Hempstead Harbor one-design class. Ity Bity had no competitor in the Horseshoe Harbor one-design class and sailed over the course alone.

The races were well managed, and the three days' contests went off without a hitch. The Regatta Committee is made up of Messrs. Frank Bowne Jones, chairman; C. E. Simmons, T. J. McCahill, Jr.; H. C. Nash and E. S. Wheeler. The summary follows:

Sloops—60ft. Class—Start, 12:35.

	Finish.	Elapsed.	Corrected.

Lake Yacht Racing Association.

TORONTO, CANADA,
Friday, August 7.

Eighteen boats started in the L. Y. R. A. regatta held off Toronto on Friday, August 7. The wind was from the N. by W., and had a strength of about twelve miles on the first round, but on the second round it petered out perceptibly. The course was an equilateral triangle of twelve nautical miles, twice around, making it a 24-mile race for the larger classes. The first leg was a spinnaker, and balloon run east by south, the second a reach south-west, with started sheets, and the third a beat north northeast.

Canada and Vreda had a very close and exciting race, and the former won by 55 seconds.

Cadillac had matters her own way in her class, but Beaver distinguished herself by beating her old rival, Genesee, although Beaver parted her peak halyards twice during the contest.

In the 35ft. class Chinook had no competitor and took a walkover. Keno won in the 25ft. class, and Whirl won in the 20ft. class. The summary:

45-footers.		
	Start.	Finish.
Canada	11 15 25	2 41 02
Vreda	11 15 25	2 41 57
Yama	11 16 30	2 46 06
40-footers.

Shelter Island Y. C.

SHELTER ISLAND, L. I.,
Saturday, August 8.

The annual open regatta of the Shelter Island Y. C. was held on the afternoon of Saturday, August 8, over courses in Gardiner's Bay. Twenty-one boats started and finished the contest. The winners were Alert, Iroquois, Flash, Isolde, and Lotus II. Effort scored a sailover.

The best racing of the day was seen in class N, in which Alert beat out Oiseau by 2m. 13s. Other boats in the class were Kalmia, Woglinde (a new Crowninshield creation), and Empronzi. The summary:

Sloops—Class D—Start, 2:15.		
	Finish.	Elapsed.
Effort, F. M. Smith.....	4 26 22	2 11 22
Sloops—Class N—Start, 2:05.		
Alert, J. W. Alker.....	2 29 02	2 24 02
Oiseau, H. L. Maxwell.....	4 31 15	2 26 15
Kalmia, G. T. Hollister.....	4 34 57	2 29 27
Woglinde, O. B. Weber.....	4 35 04	2 30 04
Empronzi, P. J. Rainey.....	4 35 21	2 30 21
Special Class—Sloops, Cutters and Yawls—Start, 2:05.		
Iroquois, J. G. Carleton.....	4 48 00	2 43 00
Seneca, H. G. Rainey.....	4 48 31	2 43 31
Martha, E. H. Coe.....	4 50 01	2 45 01
Bonnie Glynt, R. S. Foster.....	4 54 09	2 49 02
Sloops—Class R—Start, 2:05.

Juanita, F. J. Hunter.....	4 48 09	2 53 09
Whiteaway, L. A. Fush, Jr.....	5 03 40	3 02 40
Catboats—Class T—Start, 2:05.		
Lotus II, J. D. Weir.....	4 28 03	2 23 03
Minnow, L. A. Fish.....	4 50 40	2 45 50

The winners were: Alert, Iroquois, Flash, Isolde, and Lotus II. and Effort scored sailovers.

Brooklyn Y. C.

BENSONHURST, L. I.,
Saturday, August 8.

The Brooklyn Y. C. held the first of a series of races for cups offered by the Board of Governors on the afternoon of Saturday, August 8. Nine boats started, all but two of which finished. The yachts sailed under special classification on time allowance. Victories were by such large margins allowances were not figured. The summary:

Class A—Start, 3:35.		
	Finish.	Elapsed.
Winona, A. P. Soper.....	5 50 07	2 15 07
Sunshine, S. S. Fontaine.....	6 23 15	2 48 15
Class B—Start, 3:40.		
Bonito, Haviland Bros.....	5 44 07	2 04 07
Squaw, H. J. Heath.....	5 50 43	2 10 43
Class D—Start, 3:45.		
Sandpiper, W. W. Redfern.....	5 18 07	1 33 07
Warren, W. P. Paal.....	Did not finish.	
Class E—Start, 3:55.		
Boozie, C. D. Durkee.....	5 21 10	1 26 10
Rascal, D. G. Whitlock.....	5 29 46	1 34 46
Pleone, Charles Allen.....	Did not finish.	

The winners were Winona, Bonito, Sandpiper and Boozie.

Duxbury Y. C.

DUXBURY, MASS.,
Saturday, August 1.

A race of the handicap class of the Duxbury Y. C. was sailed in Duxbury Bay on Saturday, August 1, in a very light air, in which Challenge was the winner. The summary:

Handicap Class.		Elapsed.
Challenge, E. B. Atwood.....	1 01 47	
Aureolus, H. Kellogg.....	1 09 15	
As You Like It, W. T. Whitman.....	1 13 08	
Rooster, Etherington.....	1 13 34	

Seawanhaka-Corinthian Y. C.

OYSTER BAY, LONG ISLAND SOUND,
Saturday, August 8.

The Seawanhaka-Corinthian Y. C. held races for the raceabouts and the 15ft. one-design boats on Saturday afternoon, August 8. The race schedule for boats in the 30ft. class was postponed until September 12.

The course was from a stake boat off Smith's Bluff to and around the Center Island Buoy, thence to and around a stake boat off Lloyd's Neck and back to the starting line. The 15-footers covered the course once while the raceabouts went around twice. The wind was from the S., making it a reach to the first mark, a run to the second, and a beat back to the finish line.

The raceabouts were started at 3:20, and Jolly Roger was the first of the four boats to cross the line. Before reaching the Center Island Buoy, Merrywing worked into first place, and from that time on she was never headed, taking the race by a margin of over two minutes. Mystery finished in second place, and Jolly Roger was last, 14 seconds behind Nathalie.

The 15-footers crossed the starting line well bunched, but Cayenne took the lead before reaching the first mark. Sabrina took the lead on the windward work and finished a winner by 48 seconds. Cayenne gets second prize.

This was the last race for the Center Island cup, and the trophy goes to Bobs, which boat has the best standing after the season's racing.

Merrywing has the highest percentage for the Jennings cup. The summary follows:

Raceabouts—Start, 3:20.		
	Finish.	Elapsed.
Merrywing, H. M. Crane.....	6 11 36	2 51 36
Mystery, Johnson De Forest.....	6 13 56	2 53 56
Nathalie, F. G. Stewart.....	6 16 22	2 56 22
Jolly Roger, T. B. Bieker.....	6 16 36	2 56 36

Riverton Y. C.

RIVERTON, NEW JERSEY,
Saturday, August 1.

The Riverton Y. C. held a special regatta on Saturday afternoon, August 1. The wind was very light at the start, but later in the afternoon it breezed up and made the contests more interesting.

Fiona had matters all her own way in the catboat class, and beat Butterfly, the second boat, by nearly 3 minutes. Dorothea did good work in the jib and mainsail class, and beat Tadpole by nearly 7 minutes. The summary:

Catboats—Start, 3:15.

CABIA BLANCO.

Annisquam Y. C.

ANNISQUAM, MASS.,
Saturday, August 1.

A race of the one-design dories of the Annisquam Y. C. was sailed on Saturday, August 1, in a moderate S. W. breeze. Little Un won out on the windward leg after Venus had met with a couple of mishaps. The summary:

		Elapsed.
Little Un, Donald Howes.....	1 31 40	
Venus.....	1 32 30	
Sister.....	1 33 33	
Jessica.....	1 34 50	

The Fast Passage of the Gulnare.

It was not exactly the sort of place you would expect to find a clipper captain in; a neatly painted refreshment stand, with candies in the windows, dwelling rooms at the back, and a boathouse on the lower floor in the rear. It was a snug enough location for trade, just at the junction of the suburban Lake Shore road and Toronto city car lines, in the bight of Humber Bay, where the clay banks of Parkdale smooth out into beaches of fine sand. But it was scarcely where you would expect to find a salt water captain.

To tell the truth, I was not expecting to find a salt water captain, although I was looking for something just as good—one of those skippers who have made the Canadian lake schooners famous by taking them off their native fresh water and bringing them back safely after going half way round the world on the salt seas. And such a man I knew "R. Maw, Boats to Let and Refreshments," as his sign said, to be. I was in search of information about the Jessie Drummond, which—but that, as Kipling says, is another story. What follows is the one Captain Robert Maw told me incidentally.

"Yes," said he, in that deep, chesty voice, which makes you know at once that you have a man, and no make believe, to deal with, "the Drummond was a fine vessel, but the smartest thing I was ever in was a little fore-n-after called the Gulnare.

"It was in the sixties—1865—and I was in the oil trade with another fellow. We used to load crude petroleum up near Sarnia and bring it down the lakes to Montreal or Quebec, in a lake vessel, and then ship it to the old country. The shipping, it was the worst part of the job. Sometimes we'd have to wait weeks

THE SCHOONER GULNARE.

From a picture and data in the possession of Capt. R. Maw, Toronto, Ont.

or even months before we could get a vessel to take it, for petroleum's not a nice cargo.

"There was a Government schooner for sale we heard of—the Gulnare—that had been surveying on the coast of Labrador. We got her for \$5,500, and though she didn't carry much, she was a dandy—long raking spars, a 50ft. squaresail yard, 216 yards of canvas in her main topmast staysail, and other sails to match. She was 104ft. long, 25ft. beam and 16ft. deep in the hold—and you couldn't stand up anywhere in the hold, except on the keelson, she was so sharp and fine. She had a full Aberdeen clipper bow and an elliptic stern, and was coppered to the channels. She was a Charlottetown vessel, and when we got her we agreed that I should carry oil across the Atlantic with her, while my partner kept bringing it down to salt water in our lake vessel.

"I put a spar deck in her for 48ft. from the taffrail, 2ft. above the main deck, and raised her bulwarks; and since she was so small in the hold, I loaded about fifty barrels of petroleum on the spar deck and more in the waist.

"We were just sinking the coast of Newfoundland when it came on to blow from the northwest. It was in October. It freshened and freshened, and we shortened her down, but kept her traveling, and she was certainly making great time.

"Next morning, just at eight bells, I sent a hand aloft to put another stop on the foregaff topsail, for the sea was getting big and the sail had gone adrift. When he got in the crosstrees and she was on top of a sea, he sung out, 'Sail, ho!' There was a ship, dead ahead of us, but you couldn't see her then from the deck; but by next eight bells, noon, that is, we had caught up to her and passed her. She was a big Southern-going vessel, too, homeward bound, so you know how fast we were going.

"The seas piled up until they were running a thousand feet long and sixty feet high, with wave crests all of twelve feet deep on the top. When she'd drop into a hollow everything would flap. The reefed foresail was so low, you see.

"The whole crowd, except me and the men at the wheel, was forward reefing the forestaysail, when an enormous sea pooped her. We managed to hang on, but it swept clean forward into the eyes of her, and I looked to see all seven go clean over the bows, when just as the sea struck the break of the forecastle deck she gave a roll and shoved it off to leeward.

"That was a close shave, but it was the only sea that boarded her. We mastheaded the three-reefed foresail with the winch, and sent the reefed staysail and jib as far up the stays as they would go, and then she didn't get becalmed in the hollows, and we kept her driving.

"Big seas would chase her up and rear away up over the taffrail and then fall, but they would slip under her. You see, the barrels of petroleum on the spar deck kept leaking and the stuff trickled off through weep-holes in the bulwarks and smoothed the water under her counter.

"I think it was the next day that we sighted the Wild Rose, a big timber ship that had left Quebec ten days ahead of us. She was riding out the gale, hove to, but when they saw a little thing like us staggering through they thought they would make a try at it, so they waited for a smooth, swung her off, and squared away. The Wild Rose had not gone a mile when a big sea caught her square and almost swamped her. It stove in her upper works aft, washed out the bulwarks, carried away the deckload, and started her stanchions from stem to stern. They managed to heave her to again, and we learned afterward they were five days making repairs before they started to limp into port.

"After that we fell in with an Inman liner. I forget her name, but it was either Iberian or Hibernian, and she was a crack mail steamship. She was going the same way as we were, but it's the solemn truth we kept her in sight four days, and we were alongside of her the greater part of three days, going it neck and neck, sail against steam.

"Three days in succession we made exactly the same run—366 miles of longitude. The fourth day was a few miles under. By the time the mail steamer was out of sight we were on the coast of England, and the gale was breaking. We made the run in eight days and nine hours, from the coast of Newfoundland to the Lizard, and if I remember right that's 2,050 miles.

"The carrying on paid us well, too, for we sold our oil at £8 a ton higher than the other oil carriers. A fleet of them had left the same time we did, but we were in London two weeks ahead of any of them and got the cream of the market." CHARLES H. SNIDER.

Eastern Y. C.

MARBLEHEAD, MASS.,
Saturday, August 1.

In the squadron run of the Eastern Y. C. from Marblehead to Gloucester, on Saturday, August 1, the old cup defender, Puritan, led the schooners, and Nancy led the sloops, class 3. The summary:

Schooner Class.		Corrected.
Puritan, C. H. W. Foster.....	1 06 00	
Hoosier, Col. Wm. R. Nelson.....	1 06 37	
Rodina, D. C. Percival.....	1 09 03	
Constance, W. Amory Gardner.....	1 25 00	
Sloops—Class 3.		
Nancy	1 35 57	
Corina II.	1 40 57	

Monday, August 3.

A special open race of the Eastern Y. C. for restricted classes was sailed off Marblehead on Monday, August 3, in a light S. E. breeze. In the 25-footers Sally VII. got the best of the start, and led all over the course. The 22-footers went over the starting line in a bunch, and sailed a close race, in which Opitsah V. did the leading. The 18-footers were well bunched at the start, and the Question was first to get the lead. She and Chance indulged in a luffing match later, by which Aspinquid II. was enabled to come home in first place. The summary:

Class D—Start, 2:45.		
Sally VII., L. F. Percival.....	4 02 22	1 17 22
Great Haste, T. K. Lothrop, Jr.....	4 03 47	1 18 47
Chewink III., F. G. Macomber, Jr.....	4 06 11	1 21 11
Seboomook, E. A. Smith.....	4 08 44	1 13 44
Sally VII. wins first prize by 1m. 25s.		
Class E—Start, 2:50.		
Opitsah V., S. H. and H. I. Foster.....	4 15 21	1 25 21
Medric, Herbert H. White.....	4 16 02	1 26 02
Chief, S. C. Winsor.....	4 16 57	1 26 57
Urchin, John Greenough.....	4 17 30	1 27 30
Opitsah V. wins first prize by 41s.		
Class R—Start, 2:55.		
Perhaps II., J. E. Robinson.....	Did not finish.	

Class I—Start, 3:00.		
Aspinquid II., C. M. Foster.....	4 36 56	1 36 56
Question, J. H. Hunt.....	4 36 58	1 36 58
Chance, Reginald Boardman.....	4 36 59	1 36 59
Arrow, E. A. Boardman.....	4 42 35	1 42 35
Miladi II., F. R. Adams.....	4 43 03	1 43 03
Rattler, A. D. Irving.....	4 43 51	1 43 51
Moslem, B. D. Barker.....	4 44 18	1 44 18
Picaddilly, C. H. W. Foster.....	4 45 06	1 45 06
Humbug, C. W. Cole & Bacon.....	4 45 15	1 45 15
Wallada, W. W. Rouse.....	4 51 45	1 51 45
Nicknack, E. B. Holmes.....	4 52 38	1 52 38
Bagheera.....	4 59 30	1 59 30

Aspinquid II. wins first prize by 2s., Question second, chance third.

Canarsie Y. C.

JAMAICA BAY, LONG ISLAND,
Saturday, August 1.

The Canarsie Y. C. held a race for club boats on Saturday afternoon, August 1. Four classes filled and there were eight starters. All the boats finished. The wind was fresh from the S. W., and the boats covered a ten mile course. The Regatta Committee consisted of Messrs. H. C. Macy, W. W. Banta and G. W. Marsters. The summary follows:

Class B—Sloops.		Start.	Finish.	Elapsed.
Yank, C. Duly.....	3 10 20	5 54 18	2 43 58	
Lassie, Fletcher Bros.....	3 10 40	6 06 50	2 56 10	
Class C—Cabin Catboats.				
Irene, Winter Syndicate.....	3 16 40	5 50 35	2 33 55	
Ida, J. Acker.....	3 16 12	6 04 05	2 47 53	
Class D—Open Catboats Over 20ft.				
Caddie, E. X. Karr.....	3 20 22	5 58 20	2 37 58	
Aurora, A. Wirsching.....	3 21 00	5 47 25	2 26 25	
Class E—Open Catboats Under 20ft.				
Vision, C. B. Fitz Maurice.....	3 25 35	6 04 10	2 38 35	
Alice, A. Bishop.....	3 25 16	6 20 40	2 55 24	

The winners were: Yank, Irene, Aurora, and Vision.

Bar Harbor Yachting.

BAR HARBOR, MAINE,
Monday, August 3.

The race that was postponed from July 29 was sailed on August 3 in a fine strong breeze. Cricket won by 12 seconds. The summary:

	Elapsed.
Cricket, W. G. Ladd.....	1 42 03
Ben, A. Y. & P. C. Stewart.....	1 42 15
Astrild, H. Lenow.....	1 42 21
Joker, H. M. Sears.....	1 43 27
Scud, A. J. Cassatt.....	1 44 34
Kawana, J. B. Trevor.....	1 44 53
Zara, J. Montgomery Sears, Jr.....	1 44 54
Indian, W. C. Allison.....	1 50 15

South Boston Y. C.

SOUTH BOSTON, MASS.,
Saturday, August 1.

A handicap race of the South Boston Y. C. was sailed Saturday, August 1, in a light, fluky breeze. Ida J. finished first, but lost to Minerva on corrected time. The summary:

	Elapsed.	Corrected.
Minerva, W. Shaw.....	4 10 44	3 44 14
Ida J., C. Catlin.....	3 58 54	3 51 33
Eclipse, Arthur Leary.....	4 00 09	3 55 15
Nancy Hanks, G. Lane.....	4 14 37	3 57 28
Vixen, J. Cashin.....	4 24 29	3 59 59
Emma C., Perkins Bros.....	4 04 50	4 04 50

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First, \$50.00.
Second, \$25.00.
Third, \$15.00.
Fourth and Fifth, \$10.00 each.
Sixth to Eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, N. Y., on or before December 1, 1903.

A. C. A. Membership.

THE following have been proposed for membership to the A. C. A.: F. W. Bodwell, Manchester, N. H.; John R. Bowker, Waltham, Mass.

Rifle Range and Gallery.

Fixtures.

Aug. 16-23.—Union Hill Park, N. J.—Plattdeutsche Volksfest Verein annual festival and prize shoot.

Sept. 2-12.—Annual championship matches of the United States Revolver Association as follows: Sea Girt, N. J.; Chicago, Ill.; Woburn, Mass.; St. Louis, Mo.; San Francisco, Cal. Open to all. For programmes address H. W. Ott, Box 162, New York city.

Sept. 2-12.—Sea Girt, N. J.—Annual meeting of the National Rifle Association, New Jersey State Rifle Association and the United States Revolver Association.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of the Cincinnati Rifle Association, on Aug. 2, the following scores were made. Mr. Hasenzahl was out after an absence of some time, but he hadn't forgot how to shoot, for he remained champion of the day with the score of 226. Conditions, 200yds., offhand, German ring target:

	226	221	221	215	208	Honor.
Hasenzahl	226	221	221	215	208	68
Gindele	223	216	208	205	203	51
Payne	221	220	217	214	212	54
Hofman	221	215	214	211	207	56
Odell	215	212	203	203	200	62
Roberts	215	211	206	203	198	57
Drube	210	200	191	188	188	59
Hofer	210	197	194	186	182	41
Bruns	209	204	200	199	199	61
Freitag	207	205	194	194	192	51
Trounstone	205	199	193	183	181	45
Lux	198	191	189	188	186	51

Presque Isle Rifle Club.

ERIE, Pa., Aug. 1.—The club held another shoot to-day, but they had a high wind blowing right in their faces, making it hard to do good shooting. They have a match on with the Jamestown, N. Y., Club, and are anxious to do good shooting just now.

The following are the total scores: W. A. Parker 222, John Slidham 221, F. Lynch 216, John Germann 213, E. D. Allen 206, J. F. Almeda 205, John Bacon 204, C. S. Long 196, Austin Mount 193, Julius Hutner 179, Elmer Kent 156, Thomas Sullivan 156, *Frank Smith 58.

*Visitor; only fired 20 shots.

This is another club that, like the yacht club, is never heard of outside of Erie. I got the scores for the first two shoots this summer and send them. I only send the total for each man; the detailed scores would occupy too much space.

The club held a shoot on its new range on the Lake road Saturday, July 25. The weather was good, only the wind was rather too strong. The scores:

Parker	83 77 73—233	Hutner	65 63 56—184
Almeda	73 75 71—217	Allen	55 54 53—162
Mount	77 68 64—209	Riblet	61 50 47—158
Bacon	72 65 64—201	Sullivan	55 49 49—153
Messinger	64 62 61—187		

Aug. 8.			
W. A. Parker.....	79 75 75—229	J. Bacon	68 67 66—201
C. S. Long.....	80 74 74—228	J. Huttner	76 61 55—175
J. German	81 75 70—228	A. Mount	64 56 55—175
J. Stidham	79 71 70—220	T. Sullivan	56 54 53—163
F. G. Lynch.....	76 75 67—218	H. Lewis	53 49 39—141
J. F. Almeda.....	68 67 66—201		

JOHN A. BROOKS.

Rifle at Rock Island.

ROCK ISLAND, Ill., Aug. 1.—Aug. 1 was the fifth day of the Stevens rifle contest. The shooting was poor. The scores:

Sperry	8 8 8 6 7 5 8 8 6 4—68
Junge	4 4 5 8 8 4 7 5 6 7—58
	6 4 8 4 6 5 10 10 9 6—68
	8 5 7 5 8 7 5 6 4 7—62
	5 3 5 7 3 4 5 9 5 7—53
Rosenfield	5 5 4 3 6 6 7 9 5 5—51
	4 7 4 2 5 8 6 7 9 6—58
	2 4 7 5 10 9 1 7 4 7—56
	9 4 8 2 6 8 4 6 4 6—67
	6 5 9 6 8 4 3 6 5 7—59
	3 5 5 6 5 5 6 5 3 4—47
	5 4 5 5 4 8 3 4 3 6—47
Connelly	4 6 10 8 10 9 9 8 9 5—78

American targets, 100yds.; rifle, .22cal.

C. W. DURHAM, Sec'y.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Aug. 12-15.—Toronto, Ont.—Annual tournament of the Dominion Trapshooting and Game Protective Association. A. W. Throop, Sec'y-Treas., Ottawa, Can.

Aug. 15-16.—Milwaukee, Wis.—National Gun Club tournament. L. Collins, Sec'y.

Aug. 17-18.—Hot Springs, S. D., Gun Club tournament.

Aug. 18-20.—Grand Rapids, Mich.—Second annual target tournament of the Consolidated Sportsmen's Association of Grand Rapids; \$1,000 added. A. B. Richmond, Sec'y.

Aug. 18-19.—Allentown, Pa.—Griesemer's second annual two-day tournament.

Aug. 18-21.—Ocean City, Md.—J. R. Malone's ninth annual summer tournament; open to all; \$100 added money. J. R. Malone, manager, 2671 Pennsylvania avenue, Baltimore.

Aug. 13.—All-day shoot of the Brooklyn, L. I., Gun Club; Wanderers as visitors.

Oct. 23-24.—New London, Ia., Gun Club tournament. Dr. C. E. Cook, Sec'y.

Saturdays.—Chicago.—Garfield Gun Club; grounds West Fifty-second avenue and Monore street. Dr. J. W. Meek, Sec'y.

*Members of Western Pennsylvania Trapshooters' League. Chas. G. Grubb, Sec'y, 507 Wood street, Pittsburgh.

**Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

DRIVERS AND TWISTERS.

The next prize shoot of the Ossining, N. Y., Gun Club is fixed to take place on Aug. 22.

The many friends of Count Lenone, of Paterson, N. J., will feel sorrowful on learning that he is grievously ill.

The York county, Pa., target championship, shot at Glen Rock, Pa., last week between Messrs. S. M. Seitz and M. Lauber, 25 birds each, was won by Seitz, with a straight score, his opponent scoring 20.

Mr. Turner E. Hubby, at Mexia, Tex., on Aug. 7, made the remarkable score of 199 out of 200, a 99.5 per cent. gait.

The Stoughton, Mass., Gun Club has fixed upon Sept. 7 as the date for its next all-day shoot. The members of the Montello Gun Club will be visitors.

The Marshalltown, Ia., Gun Club will hold a two-day tournament in the latter part of November next. There will be targets and live-bird shooting provided by the programme.

The Jackson Park Gun Club, of Paterson, N. J., contemplates an active fall season this year in live-bird competition. Its grounds are specially fitted, both by nature and art, for first-class competition with live birds as the theme.

The second trophy shoot of the Garfield Gun Club's third series was won by Messrs. Eaton, Thomas and Bullard, Class A, B and C, respectively. Eaton tied with Pollard on 24, and Thomas tied with Drinkwater on 17. Bullard was alone in Class C with 20.

On Tuesday of this week the Sheepshead Bay, L. I., Rod and Gun Club anticipated a strong competition and attendance, the main event being for the Wright loving cup, a prize donated by Mr. John S. Wright, manager of the Brooklyn Gun Club. This cup event will be at 100 targets.

The able and energetic manager of the Cincinnati, O., Gun Club informs us that two teams, Cincinnati vs. Dayton, will contest for the Phellis trophy on Aug. 21 at Dayton, O. Some of the members of the Cincinnati team will be as follows: Medico, Van Ness, Barker, Harris, Grau, Faran, Dick, Sunderbruch and Gambell.

The programme of the Mountaineers' Gun Club, Chattanooga, Tenn., announces that the targets will be thrown from the top of Lookout Mountain, that \$250 will be added, and that there will be no handicaps. The dates are Sept. 15 and 16. On each day there are ten events, a total of 200 targets, \$20 entrance. Rose system will govern the division of the moneys. To three high guns shooting through the programme, \$25, \$15, and \$10. Manufacturers' agents are eligible to win first and second high averages only. Round trip tickets at reduced rates. The secretary, Mr. P. B. Plummer will manage the competition. Mr. Keith Webb is the president.

The assistant secretary, Mr. Lindley D. Hubbell, informs us that "the Colt Hammerless Gun Club, of Hartford, Conn., will give its fall tournament Wednesday, Aug. 26. It offers an attractive programme of fourteen events at 10, 15 and 20 targets, a total of 200 targets, with an entrance of \$20, including the price of targets. Paid experts and trade representatives will be very welcome, but may shoot for targets only. Money divided by the Rose system, and revised Interstate rules to govern. Programmes may be had by writing the secretary, R. McFetridge. A good attendance is expected."

The secretary, Mr. W. B. Allen, writes us as follows: "The club house and other buildings being erected by the Indianapolis, Ind., Gun Club on the sixteen acres of ground recently purchased for a trapshooting park are rapidly nearing completion, and everything will be in readiness for the Dedication Tournament, Sept. 22, 23 and 24. Programmes will be out of the printer's hands by Aug. 20, and from the early inquiries for copies, the attendance promises to eclipse any shoot ever held in Indiana. The club has been fortunate in securing the services of Leonard Shepherd, superintendent, for many years the assistant to Mr. Arthur Gambell, of the Cincinnati Gun Club, and this fact speaks volumes for the manner our details will be looked after."

The programme of the Interstate trapshooting tournament given for the Akron, O., Gun Club is now ready for distribution. The events are alike on each of the two days, Sept. 2 and 3, namely, nine events at 15, two at 20, and one, No. 12, at 25 targets; entrance, respectively, \$1.50, \$2, and \$1. Purses divided 30, 25, 20, 15 and 10 per cent. Targets 2 cents. Sept. 1 will be practice day. The secretary-manager of the Interstate Association will have charge of the tournament. The programme contains the following: "Guns and ammunition, prepaid and marked in owner's name, forwarded to W. W. Wohlwend, care of Standard Hardware Co., Akron, O., will be delivered to the shooting grounds free of charge. A solid gold charm, suitably engraved, will be awarded to the amateur making the highest average for the two days. Fifteen dollars will be given to the amateurs making the second and third high averages for the two days. Ten dollars will be given to the amateur making the longest consecutive run during the two days. Five dollars will be given to each of the five low guns each day. Five valuable articles of merchandise will be the prizes in event No. 12 each day." Address Mr. Elmer E. Shaner, Pittsburg, Pa., or Secretary W. W. Wohlwend, Akron, O. BERNARD WATERS.

Marshalltown Gun Club.

MARSHALLTOWN, Ia., Aug. 7.—The annual two-day tournament of the Marshalltown Gun Club closed to-day. The attendance was good, forty-seven entries on the first day and thirty-five to-day.

The programme was a long one, and called for 200 targets each day. No money was added, but \$75 was given for averages. Manufacturers' agents were not allowed to share in the purses or averages. The shooting was from two sets of traps, Sergeant system.

A high wind on the first day prevented high scores. The last day was calm, and ideal for shooting.

This club has recently built a new club house, with every convenience, and has to-day one of the finest shooting grounds in the State. It has a large, active membership of business men, who enjoy a good time. They will hold a two-day tournament the latter part of November. The programme will be a good one, and will provide shooting at both targets and live birds:

First Day, Aug. 6.

Birch Brook Gun Club.

LYNN, Mass.—The Birch Brook Gun Club held its regular shoot Saturday, Aug. 8. There were not many shooters present. Hilliard and Everett tied on the medal event, with Straw 1 behind. These three were also in a bunch in the merchandise event.

The three-man team race was closely contested, being a tie in the 25-target race, but in the 15-target race Everett, Riley and Emery came out 4 ahead.

Events:	1	2	5	6	Av.	Av.
Targets:	30	50	10	10	1.000	1.000
Hilliard	18	29	46	9	1.000	1.000
Straw	15	28	45	9	1.000	1.000
Rowe	15	24	41	9	1.000	1.000
Everett	18	28	46	9	1.000	1.000
Riley	15	19	34	9	.844	.906

The first column contains the class handicaps. No. 1 is the merchandise event. No. 2 is the medal event.

Three-man team race, 25 targets: Hilliard 23, Straw 19, Rowe 24; total 66. Everett 25, Riley 19, Emery 22, total 66.

Three-man team race, 15 targets: Hilliard 12, Straw 12, Rowe 11; total 35. Everett

Davenport Tournament.

DAVENPORT, Ia., Aug. 7.—The annual tournament of the Davenport-Cumberland Gun Club was held here this week, closing last night. That this is a successful shooting organization is evidenced by the fact that several good shoots are held here every season. It is an organization of united effort, and mutual good-fellowship, which make it a good place to come; and there is always a crowd when the Davenport boys invite the public to a shoot.

This time there was a carload of merchandise hung up, filling places to the extent of ten points in each event. There was a record attendance, and the week was altogether a most enjoyable one, with the exception of rough weather on Wednesday. Amateurs only competed for money and prizes.

Winners of honors were several for the week. Powers won the first day, with only 8 lost, although Hirsch finished in great form, with a run on the programme of 110 straight. Hirsch and Hughes tied for second, and Riehl had third that day. Wednesday, shooting under stress of unfavorable conditions, Hughes made away the best score, with only 5 down, while Hirsch and Holden finished next in order. On Thursday Riehl easily won the honors, shooting a magnificent race in the face of a severe cross wind, and losing only 7. Sperry made second average and Hughes, Hirsch, Powers and Crouthcup tied for third. The general averages in the expert class went to Hughes, Hirsch and Riehl, and in the amateur class to Holden and Powers in the order named. Scores:

August 4, First Day.

Boston Gun Club.

Boston, Mass., July 22.—The last shoot of the Boston Gun Club for the season 1903 was held at Wellington to-day and twenty shooters were present. The conditions were first class for the sport, and many good scores were the result of the afternoon's shooting.

The special 50-bird match was looked forward to with a good deal of interest, and was entered into by all present. This turned out to be just fruit for Dr. Gleason, though at first Frank was making a runaway match of it, till the last pair event, which was the stumbling block. However, he tied for second with Dickey on 44—no mean percentage at that.

Gleason also proved to be the winner in the serial prize match with a good lead over the second man. Other scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12

Ossining Gun Club.

OSSINING, N. Y.—The scores herewith were made at the regular bi-monthly shoot of the Ossining Gun Club, Aug. 8. Hans, Kromer and Washburn came up to-day for the first time since the State shoot. Kromer shot in good form; also Hans; but Washburn was "up against it" with strange guns.

Events 3 and 4 were distance handicaps. Kromer won first prize in No. 3 as a shoot-off with Bedell and Blandford. Hans took second on a shoot-off with Hubbell. Hans won first in No. 4 with a score of 13, while Kromer got second with 12.

Four sweeps were shot after the prize events. The prizes in No. 3 were silver spoon and Japanese tobacco jar. In No. 4, gold cuff links and hunting knife.

We are going up the line on Thursday with a ten-man team to take a fall out of the Poughkeepsie Gun Club.

Next prize shoot on club grounds, Saturday, Aug. 22.

Events:	1	2	3	4	5	6	7	8
Targets:	10	10	15	15	10	10	10	10

C. G. B.

Winchester Gun Club.

DETROIT, Mich.—The regular shoot of the Winchester Gun Club, Aug. 8, was a fairly well attended and a very pleasant meet.

Henry Guthard was in splendid form, running his first 32 straight, and missing but one out of his first 45.

John Ford, with a record of 24 out of 25 the last shoot, couldn't hit anything after his first 15, and gave up in disgust in the club event. All took a look along his gun barrel to see if it wasn't bent.

Mr. W. E. Gordon, of Mobile, Ala., was a welcome guest.

Following are the scores, the sixth event being the trophy handicap, and the last the club event:

Events:	1	2	3	4	5	6	7
Targets:	10	10	10	15	15	25	25
Reid, 18.....	10	15	14	21	22
Guthard, 18.....	9	14	12	22	24
Brodie, 20.....	1	12	4	8	..

D. A. H.

The Mountaineers Gun Club.

CHATTANOOGA, Tenn., Aug. 5.—I inclose herewith a prospectus of our coming tournament, by which can be seen that we are going to give the boys the best we have in stock. Every detail is being carefully looked after, and we are going to make their stay on "the mounting" the most enjoyable one they have ever had.

Following are the scores made at our weekly shoot this afternoon, which on account of a hard rain just before time to leave for the grounds, was not very well attended:

Events:	1	2	3	4	5	6	7
Targets:	10	10	10	15	15	25	25
Pechman.....	100	81	Plummer.....	80	74

Peters medal contest at 50 targets, included in above: Plummer 48, Pechman 44, O'Connell 44, Brown 40, Goodlake 38, Martin 35.

Shamokin Gun Club.

SHAMOKIN, Pa., Aug. 4.—The Shamokin Gun Club had a very successful shoot on July 28 and 29, which brought together a large number of prominent trapshooters of eastern Pennsylvania.

The trade was represented by E. D. Fulford, L. J. Squier, J. R. Hull and Frank Lawrence. Mr. Lawrence assisted the club very much as squad hustler, which was very much appreciated by the club.

The Shamokin Gun Club takes this means of thanking these representatives for their help in making our tournament a success.

Howell and Derk won high average the first day by breaking 164 out of 175; Fulford and Squier second with 158; Hull third with 155, and Blue Ribbon, fourth with 154.

On the second day Fulford won first with 166 out of 175; Squier and Hull second with 160; Mason third with 159, and Howell fourth with 158.

The five-man team shoot was won by Shamokin team No. 2 with a score of 107 out of 125. Scores:

Shamokin Gun Club team No. 2, 107; Shamokin Gun Club team No. 1, 104; Northumberland Gun Club team, 101; Mahanoy City Gun Club team, 98; Pottsville Gun Club team, 97; Milton Gun Club team, 91; White Flyer Gun Club team, 85; Shamokin Gun Club team No. 3, 83.

Scores first day:

GOOD WORDS FROM MONTANA.

COLLEGE professors are not usually supposed to be greatly interested in game protection. That they sometimes are interested, and very deeply so, is shown by an extract from the speech of one of them delivered some time ago before a learned society.

Prof. Morton J. Elrod occupies a chair in the University of Montana, and he is also the director of the Biological Station work, which for several years has been so well carried on at the Flathead Lake as to be a very great credit to the State. At the first meeting of the Montana Academy of Sciences, Art, and Letters, Prof. Elrod delivered an address, in the course of which he said: "The Academy should aid in the protection of those relics of the past which are of common value and interest to the people of the State. I refer to the preservation of the forests, fish, and game, and of historic places and objects. The sentiment for game and fish protection in the State is small. I make this statement after careful deliberation and several years of close study of the question. There is a *desire* for game protection, but little *sentiment*. The minimum penalty is usually imposed on the offender, and not infrequently the penalty is less than the amount specified by law. The members of the Academy should be radiating centers from which sentiment emanates for game and fish protection. They should have a keen eye open for the senseless persons who ruthlessly slaughter song birds in the vicinity of cities or towns. There are in the State many places of historic interest. The members of the Academy should be on the alert for such, and should use diligent effort to have them preserved. Historic relics grow more valuable with age."

It is gratifying to see in Montana, where especially such instruction is needed, a man of the standing of Prof. Elrod expressing sentiments which the FOREST AND STREAM has been teaching for so many years. It is characteristic of Americans that they do not seem to value their good things until they have wasted and destroyed them beyond the hope of reparation. Montana is still too near to the time when game was plentiful to care for her game. It has still extensive forests, and the average man cares nothing for them. Happily, within that splendid State is a leaven of wise and far-seeing men; and on the influence of these men the future of her forests, her fish, her game, and her historic relics in large measure depends. We have confidence that the efforts of these men will lead to an awakening of sentiment in favor of such preservation before it is yet too late, but there is much work to be done before such feeling will be aroused.

THE CLOSED AND THE OPEN MIND.

MANY unfortunate folk deprive themselves of innumerable opportunities to participate in beneficial enjoyment, to acquire useful knowledge, to make pleasing and valuable friendships, because of what may be termed a closing of their minds. Of the closed minds, there are varying degrees, from the partially to the wholly closed. With many people prejudgments, preconceptions and prejudices are so strong that they interpose an impenetrable barrier to advancement in any paths of knowledge, pleasure or sociability other than those to which they are narrowly confined by locality or habit. Their every day life, thought, and interest become a standard of values by which all else is judged.

Let a person afflicted with a closed mind journey into strange sections of his own country or into foreign countries, and everything which is new or novel is therefore wrong. For no other reason than that anything is different from the environment to which he is habituated, he condemns it. Instead of entering heartily and freely into a life associated with new surroundings, he endures the new experiences much as one might endure a martyrdom for conscience sake. From the citadel of his closed mind he plans and executes all his defenses against the invasion of new ideas and the escape of old ideas, and the big gun of the citadel is no more a thing of limitations in its work than is the man of closed mind in his mind's action. Of this nature are the intolerantly opinionated, the blasé, the vain and the provincial men. From this class come the most importunate and most persistent disputants, for they most strenuously maintain the fractional part they do know against all the rest they do not know, and, by virtue of clamor, come near to proving that the part of anything is equal to the whole of it.

How different is the progress in the affairs of life of him who can discern and concede that there is good everywhere, that prejudice or habit of life is not any standard of progress, and that true knowledge or enjoyment means the unlearning of what is past and useless as well as the learning of what is new and valuable. The man with an open mind willingly listens to the opinions of his fellows and weighs them dispassionately, fairly and amiably. If sound, he frankly accepts them, even at the cost of wrecking some of his own pet fads or fancies.

If he goes for a boat ride, he does not spoil the pleasure of it for himself or his companions by decanting on how much better he enjoys golf, or shooting or fishing. If he finds himself in camp with men of dress and speech and ways unlike those of his conventional surroundings, he finds in this very novelty qualities to interest and very likely something to instruct him and enlarge his knowledge of the world, and to broaden his views and to enlarge his sympathies. The sportsman tourist, who with open mind enjoys what fortune brings, is more and more a citizen of the world, as he mingles with the people he meets on his pleasure trips, and learns the lesson that under the various guises of local peculiarity the human heart is the same, north and south, and east and west.

PRESERVES AND SANCTUARIES.

THAT subject of game preserves would be profitless of discussion if the consideration of it were confined to a debate on abstract ethics. However cogent and convincing might be the argument on either side of the question, we apprehend that nothing practical would come of the exchange of views. After all had been said that might be said, things would go along just as they had been going. The result would be like that of St. Anthony's sermon which so edified the fishes—

The sermon now ended,
Each turned and descended;
The pikes went on stealing,
The eels went on eeling;
Much delighted were they,
But preferred the old way.

If any good can come of the discussion we think that it is to be found in the renewed attention drawn to the expediency of setting apart public game preserves for public use. The suggestion contained in the communication of our Toronto correspondent this week is the one practical lesson to be drawn from a study of game conditions as they now prevail in North America: The State should set apart available territories as permanent breeding grounds for its game and permanent hunting grounds for its citizens. The proposition is not new; in fact, it is already in operation here and there throughout the country, but the importance and urgency of the system are such as to entitle it to continued discussion and to constant claims upon public attention.

As a rule, such game preserves can be provided more cheaply and conveniently now than in the future. There are at this day in most States large territories of unoccupied lands which either already belong to the State or may be acquired very cheaply; and which are capable of sustaining a game stock if reasonably protected.

The initiation of any movement in this direction must be made by the sportsmen. The provision of State game preserves should have recognition as an object of attention and effort with every sportsmen's organization in the land.

We should have not only public game preserves in which shooting is allowed under restriction, but game sanctuaries, dedicated as permanent and inviolable game refuges, where the deer, the grouse, the quail, or the wildfowl may at all times and under all circumstances enjoy absolute immunity. Let us take a lesson in this from the European system of game preserving. Every well appointed European deer forest has its sanctuary. This is a section set apart as a safe refuge to which stags and hinds may retire at all seasons of the year and where they are never molested. The deer very quickly come to recognize the nature of the sanctuary; and in the hunting season are likely to repair to its security, "so much so," writes an English deer stalker, "that toward the end of a late and backward season it is more than tantalizing to go out stalking day after day to find outside the sanctuary only hinds and stags not

worth a shot, and perhaps to have to pass the sanctuary on the way out or home and to see with the glass, or, maybe, with the naked eye, heavy beasts with coveted heads still occupying their wonted places in the sanctuary. Sooner or later, driven by pressure of the season of rutting, they are bound to quit their safe refuge and seek their hinds upon the hills; but perhaps your stay on the forest is limited, or the fateful day of closing is approaching, and then it must be admitted that the sight is, indeed, a tantalizing one."

The purpose of the sanctuary is not to spoil sport, but precisely the opposite of this, to save the game and perpetuate the hunting. The sanctuary is recognized as an indispensable factor in the maintenance of a deer forest. Without it there could be in the end no deer stalking. A condition worthy of note is that although adjoining forests may not be divided by boundary fences, and passage from one to another may be entirely unrestricted, the deer of one park when alarmed by the stalkers, do not flee to another forest, but seek the accustomed sanctuary on their own range. In other words, when such a refuge exists, the hunting does not drive game out of the country but keeps it home.

Why might not sanctuaries be established in the Adirondacks, comprising districts designated by the Forest, Fish and Game Commission?

New Zealand waters have been stocked with American brook trout and rainbow trout. The rainbows have not done well, and it is thought that the temperature of the waters may not be suitable. California quail have been put out, and in some districts are doing well, while in others their disappearance is ascribed to an increase of stoats and weasels. The American Bob White and pintail grouse have been added to the New Zealand game resources.

From Europe there have been introduced many species of insectivorous and song birds, wild ducks, wild geese, partridges and black game and barn owls; and Australia has contributed minahs and plover. As is well known, the red deer and the fallow deer have long been established in New Zealand. This work of introduction and protection has been carried on for thirty-seven years by the Otago Acclimatisation Society; and the results have been substantial and promise to be permanent. It is to be noted as a curious circumstance, that the fame of the New Zealand deer hunting is such that sportsmen from Great Britain have made the trip to the antipodes to engage in it. A license is required for fishing, deer shooting, and the shooting of imported game, the revenues going to the society and being expended by it in its work.

Two French zoologists, Messrs. Lartet and Gaillard, have been studying the mummified fauna of ancient Egypt, for a comparison of animal forms of that period with those of the present; and the conclusion reached by them is, that the ox, the dog, the cat, rats, antelope, gazelles, sheep, falcons, eagles and owls of to-day are in no wise different from their prototypes of thousands of years ago. The Egyptian sheep of the twentieth century is the sheep that was domesticated in the neolithic period. There has been no transformation, no evolution in all this time. Nor, say Messrs. Lartet and Gaillard, is this fact in conflict with the doctrine of evolution. For, in order that species may be changed, their environment must be modified; and the Egyptian environment has been remarkably constant during the period in question. In this environment, very uniform, very constant, very stable, animals have not varied for five, six, and, perhaps, seven thousand years.

MR. C. C. WORTHINGTON, of this city, who owns a deer park at Stroudsburg, Pa., began eleven years ago with a stock of nineteen deer, which have now increased to 2,000. The preserve comprises only 1,000 acres, and the food supply is inadequate. Last winter public attention was called to the starvation of some of the deer. Now Mr. Worthington announces his intention of turning out 1,000 of the superfluous animals to forage on the surrounding country. If his purpose shall be executed, there should be some good deer hunting in the vicinity of Stroudsburg this year.

The Sportsman Tourist.

To Elysium by Buckboard.

In Three Jaunts—Jaunt the Second.

UKIAH was a cheerful, kindly little town in those days, and the character of its inhabitants has not changed, although the railway has moved ahead into the wilderness. The voyagers passed two days there right pleasantly, and had they accepted all the invitations to go fishing which they received, the buckboard would still be standing in Miller's barn and Goliath, if living, would be the equine wonder of the country. But the *wanderlust* was gnawing at their heartstrings, and they felt that in that shadowy Somewhere, away beyond those purple mountains, the wild things of the woods were marshalled in line, anxiously awaiting their coming. It would never do to disappoint such obliging quadrupeds, thought the buckboarders, and so, on the morning of the eighth, they tore loose from their snug moorings "at the first crack of dawn" and were well across the valley before Ukiah's piscatorially disposed citizens, with their hospitable intentions, were afield.

Even at so early an hour the highway presented a picture of life and color. From a cloud of orange dust in the distance the rhythmic jingle of bells broke upon the ear, and then a mule-train lumbered into view, its two and sometimes three wagons linked together with heavy steel cables, while the driver, perched up aloft in a sort of crow's nest, urged onward his happy-go-lucky team of eight or ten mules and horses, with twenty-five feet of whiplash and a seemingly inexhaustible supply of stones and cuss words. Again, skirting the snake fence, as if despising the white man's road, came a family of Indians, the old buck, gorgeous in a scarlet shirt and overalls of blue jean, shuffling along in the lead; then his sons in store clothes, maybe, and lastly, well to the rear, the squaw, her head swathed in a party-colored shawl, her papoose in a basket on her back. "That old acorn-and-frizzled-grasshopper-cruncher must be a dowager duchess at least," said Bob, as a particularly ill-favored crone, smoking a short and very black clay pipe, waddled by. "What makes you think so?" "Her tribal marks. When these Pomo girls get full grown three lines are tattooed in blue from the corners of the mouth and center of the lower lip to the point of the chin, and as she grows older these lines are made wider. If her husband is a person of consequence, or if the woman distinguishes herself in any way—is the champion basket maker of the village, or the like—she is entitled by tribal law to thicken her lines very materially. Now, that hag looks as if she had been fed on huckleberry pie from the day of her birth and had never had her face washed. Hello! There's the rancheria and an Indian school, too, if I'm not greatly mistaken."

Now, Bob had a genuine bachelor's love for children, and when that red and white schoolhouse hove in sight he changed the reins to his right hand, while his left went groping through sundry pockets for stray dimes and nickels. In the doorway stood a sweet-faced nun, and her charges, who ran all the changes in the color scale from smoked ivory through fiery copper, cinnamon-brown and sage green to light amber, romped and shouted in the yard beneath the live oaks.

"Come here, little fairy, and tell me what your name is," cooed Bob, to a demure and pretty miss of eleven, who, forefinger to lips, was making ox eyes at Rondo.

"I'se Sara Bernhardt, who'd you fink I was, you ole fool you!" and a very pink tongue shot out between very white teeth and wriggled derisively. Poor Bob! "It's a waste of time trying to educate these—ahem!—Indians. Gee 'lang!" was all he said.

Russian River was crossed by a ford, the bridge, a substantial looking structure, being boarded up at both ends. "What's the matter with the bridge?" Marin inquired of a traveler, who was watering his horse in midstream. "Nawthin' as I've hear'd tell of. That thar bridge cost the county a sight of money, and the supervisors 'lowed as how thar warn't no sense in usin' it up a-drivin' over it in summer when the river's low. Say, how'll you trade for that thar houn' dorg?" But Rondo remained with the buckboard.

Angle Creek—well named it was, forsooth—was reached before luncheon, and Marin, who was prospecting for a bathing place, discovered that the pool which he had selected was fairly alive with big trout. Fortunately he made the discovery before plunging in. A "coo-ey" brought Bob and the tackle, and for an hour those two knew the joy known only to him who whips virgin water. But one hour brought a surfeit, for, as Bob phrased it, "one soon tires of fishing when the fish fight among themselves to see which will get caught first."

It was a long, hard pull for Goliath up Angle grade, but the buckboarders lightened his load by walking, while they drank deep draughts of the pure mountain air and watched with never-ending wonder the marvelous panorama of pinnaled gorge, foaming cataract, the forest's opaque greens blending into hazy purples, the tiny recessed glens, tawny with ripened wild oats, unroll at their feet. In one of these a doe, two fawns and a stag were placidly feeding, the buck, as usual, at the edge of the timber, ready to dissolve into its leafy shadows at the first hint of danger. The crested mountain quail, a new bird to the wanderers, challenged from every coppice or strutted in jaunty independence before them, "like a Hieland chief in his ane glen," Bob thought. "And how unspeakably good it feels to be alive!" he added, and Marin echoed his words in his inmost soul.

At the head of the pass, beneath Black Bart's rock, the scene of many a hold-up, stood a buckboard, and with that easy freemasonry of the road, which is soon learned, the travelers opened conversation with its occupant as soon as they were within hailing distance. This proved to be a most fortunate encounter. During the stay in Ukiah, while Bob talked "camel" to Miller, Marin had availed himself of the opportunity to interview all and several of Miller's drivers, and as a dry driver can scarcely be expected to shine as a conversationalist, he had irrigated them thoroughly before beginning. The result was a plenteous crop of notes about the road, the

people living along it, the outlook for game, possible side-trips, good camping grounds, and the like. Upon one point all hands were unanimous, and that was that if the buckboarders could win permission from one Beauregard Bowman, of Rattlesnake Creek and its dependencies, so to speak, to hunt over his land, the measure of their desires should fairly brim over. And thus it came to pass, in that noontide confab on the mountain crest about deer, bear, dogs, and men, Bowman's name was mentioned. "I wish to gracious we could get solid with him," said Marin; "I understand that he's a good deal of a crank—don't allow anybody to kill spike-bucks on his ranch, and has had a lot of fellows fined for violating the game law. Now, that form of crankiness is by far too uncommon in California. Do you know him?" "Yas, sorter casual like. I see him when I was dressin' jest afore I left home. Boys, he's one of the durndest, orn'riest, no-count galoots in this yar county. Ain't got no more eddication than a burro. Don't know nawthin' 'cept bars an' hogs. Lives all alone wit' his ole mother an' a 'tarnation slew of bar dogs a-top of a mount'n so durnd keep that they have ter feed the chickens buckshot ter keep 'em from rollin' off the ranch. Most folks up thar won't have nawthin' ter do wit' him, nohow. Reckon he thinks 'bout as much of me as of the hull bilin' of 'em. Ef you boys can 'range ter meet me t' Cummings 'arly Thursday, I'll make that ole hog-buster take ye on a bar hunt; I will, by thunder, ef I have ter lass' the critter an' snake a double diamond hitch on him. Camp under the big tanbark 'longside the crick," and with a promise to keep the appointment without fail, the buckboarders parted company.

At the Angle ranch on Walker Creek, tucked away in a fold of the mountain, the wayfarers first heard mention made of an animal that was destined to furnish food for speculation until their return to a country where books of reference might be got at. They were turning over a collection of lynx, coyote, fox and raccoon skins, and among them were several pelts closely resembling 'coon skins, only narrower.

"Them's mountain cat," said the sheep herder who was doing the honors.

"What do they look like?" asked Bob.

"Bout same's a cross 'tween 'coon and cat, I reckon."

"Ever hear of him, Marin?"

"He's a stranger to me," and when the shepherd was out of earshot: "This shows you what country people are. Now, that fellow has probably lived here all his life, with every opportunity for independent observation, and yet he gabbles that nonsense just because somebody equally ignorant told it to him when he was a boy. Anyone with good eyesight can see that these are the pelts of young raccoons."

"Well, I don't know about that. It appears to me that the head is different and the whole pelt's slimmer, anyhow. You remember that those Washington scientists were all at sea on the bear question till the old Huskies out in the Rockies set them right."

"Bob, this is positively too bad for you! For an educated man with some faint traces of refinement, which, by the by, would be accorded a fuller recognition if you would wash that shirt of yours, to echo the errors of the vulgar, is unpardonable. What you term the 'bear question' was recondite, and its determination depended on denotation and a dozen other things. This is a simple proposition, as easy as rolling off a log."

It was a famous war while it lasted! The combatants renewed their supply of ammunition at every halting place. The strange animal was nocturnal—"Coon," muttered Marin. He had a predilection for poultry—"Got it legitimately!" In winter he had been known to invade dwellings—"Clear evidence of immaturity!" He was sometimes known as a ring-tailed cat—"Proof positive; the common raccoon is so styled in parts of New Jersey!" Thus Brigadier Bob rained verbal grape and cannister day after day into General Marin's redoubt, while that grizzled veteran kept him on the hop, by days, dodging shrapnel, and even routed him up at night to defend his position against a general sortie. It was the last week of the outing, and Marin was seated on a log at the bottom of a sparsely wooded canyon, listening to Rondo's music drawing nearer, when he caught a glimpse of an animal with a 'coon's tail but a round, feline head, mincing with cat-like tread along the projecting limb of a huge laurel. At that instant the brush began cracking and a forked horn crashed into view, only a second later to be hurled into the bracken a plunging, quivering, stricken thing, its crimson life-tide welling through the ragged gap in its forehead. Cruel sport, my masters! When Marin had finished his humane but hateful task, that ring-tailed paradox had vanished; but that one glimpse had been enough. He didn't say "Coon" to Bob again that journey. Once in San Francisco, Webster and the Century cast a flood of light on the subject, thus:

"*Cacomixle* (*Cacomixtl*, etc., Mexican). A. N. A. carnivore."

"(*Bassiris astuta*) about the size of a cat, related to the raccoons. It inhabits Mexico, Texas, and California."

The gentleman who made the wood cut in Webster's, however, must have had the grandpa of all the *cacomixles* for his model, for his *Bassiris* looks as though he had wild turkey for dinner every day and a double helping Sunday. But to get back to the buckboard.

"That is the old Walker homestead," said Bob, pointing to a big white house standing desolate and alone on cleared land below in the canyon. "They were among the earliest settlers here, a father, mother, and seven small children. One day the father took sick and that night he died. The poor wife was at the barn before sunrise, hitching up for her twenty-mile drive to fetch aid to bury him, when a cry from the house called her. Her eldest son and her six-months-old babe had been stricken. And so, one by one, they sickened and died, and when, with reverent hands, a passing drover lifted their wasted forms that he might the better peer into their faces, all were dead save one—a little girl. At the bed-head of her little one, half reclining upon it, lay the mother, a cup of water on the floor beside her, her cut and torn hands clasped in prayer, as if, in the supreme hour of her suffering, when that terrible weakness which precedes dissolution clutched her, she had heard her child cry for water and had crawled to the well and brought it ere the Healer of Sorrows mercifully brushed her brow with his ebon pinion."

Within a rudely fenced inclosure by the wayside sleep those eight side by side, and Marin plucked a California poppy from one of the two larger mounds in remembrance

of the brave, true heart beneath. There was little laughter in their camp in Little Lake Valley that night, and their camp-fire talk touched mainly upon Donner Lake, the sufferings of the pioneers and the heroism of the pioneer women.

"This is Eel River water," said Bob, as he performed his morning ablutions, while Marin officiated at the skillet. "Walker grade is the watershed. Everything south of there, after leaving the Bay, flows into Russian River, and every stream that we shall cross for two hundred miles north of here as we jog through this chain of narrow valleys finds its way somehow into one of the three main branches of Eel. If our map is to be depended upon, we should make Willets in an hour." But, whether the map was at fault or the opportunity offered by a flock of wild doves to get the commissariat off its bean and bacon basis proved irresistible, this hamlet of eighty souls was not reached until 8 A. M. To-day Willets is a railroad town with 1,200 inhabitants and a \$40,000 hotel, which the old-timers speak of in awestruck whispers.

The travelers were now beyond the Ultima Thule of the advertising solicitor, and hence, if anybody had anything to sell, he stuck a notice on his front fence and patiently waited for somebody to drive by and see it. These quaint signboards, with their homely spelling, were sometimes humorous, sometimes pathetic. One on the outskirts of Willets read:

SHAKes FUR bARter
N. b. FUR MOSt ANiTHING.

"Bet that fellow's a Down-easter," said Bob. "He has intuitively struck the key-note of all successful advertising." Another sign, on a neatly painted gate, through which they caught a glimpse of a plaintive little flower-bed, weed-choked, caused a different emotion. It read:

THIs RANCH FOR SAIL
COS: WIF DEAD.

"A man cannot accomplish much in this country, single-handed," mused Bachelor Bob.

"Nor in this life," replied Benedict Marin.

At Sherwood, imposing enough on the map, but consisting in reality of one log cabin with a rough board annex, the road forked, one finger-board reading "Cahto 12 Miles;" the other, "Laytonville 14 Miles." "Which is the better road?" asked Marin. "Nuther," came the cheerful response from a patriarch, who was busy patching his harness with bale rope. "Ef you travel Laytonville way, you'll wish ter gracious you'd a cum by Cahto, an' ef you take the Cayto road you'll swar that ef Laytonville's worser nor that then it's the goldurndest road in Mendocino." "I vote for Laytonville," cried Bob, and for the first and only time the buckboarders had to make a dry camp. However, on their return, they essayed the Cahto road, and found that the aged unknown's summary was as accurate as it was succinct. There may be worse traveling somewhere—but why discuss a theological problem?

Laytonville, the outfitting point for the Round Valley Indian Reservation, offered few attractions, but the road beyond it was a good one and a plunge in a white sulphur spring outside the town was a treat; for, be it understood, there are cleaner ways of journeying than by buckboard. They counted seventeen deer on hillside and in canyon that day, and the big tanbark by Rattlesnake Creek was reached early in the afternoon. "I wonder if that hog-buster's friend will show up to-morrow?" "Never fear! I only hope the Buster himself will prove to be half as good a fellow."

When Marin disengaged his head from the blankets next morning he noted with surprise that a third blanketed figure lay beside Bob, feet to the embers, and that Goliath had been joined by three companions during the night. The figure stirred and sat up. It was their friend of Black Bart's rock, but he was alone. "Howdy!" he cried, cheerily. "How you fellers can sleep! That houn' thar started a growl when I kum up with the hosses; but I spoke soft ter him, an' he shet right up closer'n a bar trap."

"And where is Bowman?"

"Durn his pesky hide, the critter's strayed off the ranch somewhar; leastwise he's not to hum. Shucks! That don't make no sort er difference. Put yer hoss an' buckboard in Cumming's barn, an' kum up ter breakfast." With some misgivings the buckboarders complied. A tall, gentle-faced lady, whose erect carriage contrasted strangely with her snow white hair and gold-rimmed spectacles, met them at the doorstep. "Mrs. Bowman," said their guide, "low me ter 'duce some folks from the Bay, w'ich seein' as how your son ain't ter hum I've—"

"Beauregard, quit your fooling! Gentlemen, I'm right glad to see you." And how Bowman enjoyed his joke! His laughter shook the dishes on the breakfast table and started his fourteen bear hounds baying in their kennels. After breakfast, while Bob and Bowman packed the camp kit on the old buckskin mule, Marin watched Mrs. Bowman feed her pet bear—a three hundred pounder anchored to an oak in the corner of the orchard. With her apron full of apples she seated herself on a projecting root, while the unwieldy brute stood on his hind legs beside her, drooling with an anticipatory rapture that was fairly idiotic. One by one she handed him the apples; he grabbed them with outstretched paws and shovelling them into his great mouth, while tears of unadulterated joy trickled from his eyes and mingled with the stream of apple juice. Once, when her attention was diverted momentarily, he gently insinuated his nose into her apron, but a fillip and a word caused him instantly to withdraw it, whimpering and rubbing his face with his paws, a picture of woe, so comical and yet so nearly human that Marin did not know whether to laugh or to feel sorry for him. One thing was certain—Mrs. Bowman's fillip would not have harmed a mosquito.

The start was made on horseback with the pick of the pack—eight hounds—leashed in couples by link and swivel and old Buckskin with the baggage bringing up the rear. Every animal on the ranch knew what was expected of him and did it without being told. The dogs took their places in the cavalcade and kept them, although

before they were released they danced, yelped and "carried on" as though they would tear their kennels to pieces. "How did you train them?" Bob asked. "Car" an' kindness," answered Bowman. "Nary houn' on the ranch has ever felt whiplash. Ef a dog won't do right I talk to him same as you and me'd talk. Ef a'ter two or three talks he won't do right, I get rid of him." "Sell him, I suppose?" "No," said Bowman, slowly, "I don't 'xactly sell none. You see I riz these hyar houn's an' somehow I jest can't sell none. But th' neighbors 's glad to get sech as I can't make bar dogs of. I don't know what luck we'll have this trip, 'cos it's dry, scent won't lay an' dogs get all het up; but we're gwin over near the coast in the redwood a-back of Usal, whar bars is plenty an' whar the fog kums sneakin' up the canyon 'bout two a'ternoons, an' lasts till ten, mornin's. Ef we don't shake one up thar I'm an Injun; but gettin' him depends on the dogs not chokin' out."

"What on earth is 'choking out?'" "Wal, in hot weather, a'ter the dogs has treed a bar, sometimes they's so tuck'ed plumb out that a'ter bayin' him few times they leave him an' hunt water. We call that choked out. 'Course Mr. Bar moseys."

The trail—it was a well trodden bridle path—led along the summit of the ridge through a park-like forest of oaks—tanbarks and white oaks, chiefly—with here and there a flowery glade; and these wild gardens were alive with does and fawns quietly feeding. They gave no heed to the dogs, horses and men, nor did the well-trained hounds betray the slightest interest in their movements. "The spike-bucks are jest as gentle," said Bowman. "For ten years no small deer 'been hunted on this hyar ranch 'cept twice, and I 'rested them sneak hunters myself, an' drug 'em 'fore the jestic to Cahto. The one war a doe, an' he pled guilty an' war let off wit' \$25 fine an' 'spences. T'other war a blue-jay 'lyar from the Bay, an' he kep' 'ceptin', objectin', an' 'pealin' till he'd got ole Simpson, the jestic, bilin'. 'Gol-durn yer, I'll show yer who's a-runnin' this hyar cou't,' sez he. 'Jedgment is ye pay \$200 fine fer killin' that doe; \$50 mo' fer 'tempt of the pusson of this hyar cou't; 'spences of Mr. Bowman fer a-gettin' of ye hyar, \$3.75; an' costs \$27.40.' 'Yer can't do it,' sez Blue-jay. 'The statoo has done fix the max'mum penalty fer doe killin' at \$50, an' ye ain't got no 'tempt 'thority, no-how,' sez he; 'I 'cept an' I 'peal!' 'Ef you's wishful fer ter argify them pints with me pussonly,' sez Simpson, 'I'll 'jurn cou't hyar an' now,' sez he; an' you'll need 'peal po'ful loud fer shuah 'fore I'll tar loose of ye! Jedgment stan's, an' they ain't no 'peal.' They tied Blue-jay up in ole Simpson's hay barn till he paid an' the Gov'ner done hold a 'vestigation; but us folks 'lected Simpson 'gen. There ain't been no doe hunters about this hyar ranch sense."

The oak openings were succeeded by wild oat mesas, sloping away to the south and cut by numerous small wooded gulches, about which the deer were feeding literally in droves. Bob attempted to keep count of them, but abandoned the attempt. Marin recalls, however, that he counted eleven in one band in a small burnt opening beside the trail; all spike-bucks save one, and he was a whopper and did not wait to be scrutinized. Toward noon the trail led them through a forest of mixed conifers, down an abrupt descent to the South Fork of Eel River. Across the ford in a clump of redwoods stood a cabin. "Whose is that, Mr. Bowman?" asked Bob. "Mine. Built her las' hoggin' time. Say, boys, mos' folks hyarbouts calls me 'Beaug.' 'Spouse you does?"—and Beaug it shall be to the end of the chapter. MARIN.

[TO BE CONTINUED.]

In the Wilds—A Memory.

(Concluded from page 423.)

The tired and happy men rolled themselves in their blankets that night and never wakened until the sun was peering over the treetops the next morning. A plunge in the cool waters of the lake and a glorious swim, was followed by breakfast, and when all things were made clean and tidy in camp, all hands made ready to go a-fishing.

The sun hung like a great copper disk in a brassy sky, scorching everything with a fervid heat. Not a breath of air stirred the glassy surface of the water, and even the aspens forgot to tremble at their sad memories. No self-respecting fish could be expected to bite on a morning like this, and the fact was soon appreciated by all hands. Like "Br'er Rabbit," when he stopped to say "howdy" to the Tar Baby, "right thar they had drapped their merlasses jug," by not getting up before the sun on such a morning as this.

The day was intolerably hot, with a breathless autumnal heat that was very trying, even in these cool shades, and all hands gave the day to indolent repose, grudgingly giving enough time and effort to preparing and eating a midday meal.

Slowly the trying day dragged by, and an early supper was prepared and eaten, in order that the evening hours might be available for sport. Still not a ripple stirred the water, and the air was as hot and stifling as at midday. As soon as the sun was screened from the water by the trees on the western shore, all hands set to work. F. had looked out a favorable and likely spot on some rocks near camp, and preparing some strips of the belly of some of the captured fish for bait, was soon at work. The other three, with Rory at the oars, took the boat and began trolling. They had better spent the time admiring the beauties of nature, for not a bite did any one get.

The useless efforts were discontinued, and all returned to camp, where pipes and merry stories passed the evening, and when the men went to bed it was with the understanding that they were to arise at the first approach of dawn, and do their fishing before breakfast, if conditions remained the same.

Rory's voice aroused the camp as soon as objects were faintly visible under the brightening morning sky. He said he would remain in camp and prepare breakfast, while the others went out. T. said he preferred to take the oars. F. went to his rocks as on the previous evening. Soon after leaving shore Scribe hooked a fish, and after a sharp struggle landed a twelve-pound pike. Another five-pound one was landed by E., and that ended the biting. This was disappoint-

ing, as several large fish were seen, as they darted from the shallows into deep water.

The smaller fish was cleaned and fried for breakfast and the larger one was rolled in cool fern leaves and laid away in the shade for later manipulation.

The sun climbed into the same brassy sky as on the previous day, without a cloud to obscure it, or a breath of wind to temper its rays. It looked as if a hot, dry term was on, and that little sport could be expected. However, the party was getting enough to eat, and what more did they need? They had no means of disposing of more, and not one of the men would have countenanced wanton destruction, so everything was accepted philosophically, and no grumbling was heard.

After breakfast Scribe took his gun and started out to find some birch bark, and in an hour's tramp got what he wanted, and brought back six young grouse with it. He could have brought twenty, just as easily, but no more were needed.

As noon approached, the pike was unrolled from the fern leaves and washed clean without opening. It was then rolled tightly in the birch bark, swathed in green grass and thickly coated with the best clay to be found. A large fire was built, at a distance from camp, and when this had burned down to a bed of glowing coals these were raked aside, the fish in its envelopes was placed in the hot ashes, and the coals drawn back until it was covered several inches deep with them.

In forty minutes the fish was taken out, the outer coverings of clay and grass removed, and was then placed upon the camp table in its bark envelope. When this was opened there lay the great fish, done to a turn and only needing some salt and butter to make it a dish fit for the palate of the most discriminating of good livers.

Try this some day, gentlemen! If rightly done the memory will remain, even as it has remained with Scribe for thirty odd years.

They all ate to satiety, and probably a little beyond, and then discussed the possibility of any one of them ever being hungry again, while the hot afternoon dragged by. There was not even an insect to disturb the drowsy hours, and the insistent silence of the forest gripped the men, and held them in quiet contemplation.

No one stirred till the shades of evening were approaching, when they decided that very little supper was needed, and they would have the evening's fishing first.

It was no use, conditions were unfavorable, and no one got a bite.

The following day it was the same story, and after breakfast F. and Scribe started out to explore the surrounding country, taking a light lunch along and telling Rory to have a grouse stew ready for use about four o'clock. Scribe took his gun and F. an ax, for, said he, "it's allers handy tu hev along, fer yu may want tu get yu some gum, or yu may want it ter kill a bar, an' yer allers ready an' loaded fer anythin' atween." All of which is good philosophy for the forest.

They went to the little meadow at the head of the lake, and examined it for "sign," finding it all cut up with deer tracks. No larger animal was traced. A flock of grouse went whirring out of the grass, alighting in the nearby aspens, but they were not disturbed. The men then struck east, looking for higher ground, and after an hour's steady walking found no hills from which a view of the country could be had.

The purpose F. had in view in taking the ax had long been apparent to his companion, as an occasional score upon the bark of a tree would serve as a guide on the back track, should such be necessary.

At last they came to a bit of rising ground, and Scribe climbed a tall and commanding spruce that offered an easy ascent, owing to a smaller tree having lodged its top in the other's lower branches. From the top of this tree a fair view was obtained of the surrounding forest.

Away to the east, for miles and miles, lay the level forest. To the north the country fell away, to appear again in a distant line of blue forest. To the west and northwest lay the swamp and the higher country beyond it, which the party had traveled in reaching the place, dominated by the dark slopes of Red Mountain. Southward, the land rose gradually, to distant forest clad hills, and about two miles away was seen the only nearby break in the solid forest. Bearings were taken for this opening, and after the descent of the tree by Scribe, the two struck out for it. After an hour's brisk walking the break appeared, and proved to be nothing more than a large meadow, partially overgrown with willows and small firs, interspersed with a few blueberry bushes. At some very remote period the place had been overflowed by the work of beavers, and through the center of the meadow still flowed the little stream which the animals had dammed and utilized. The turf was all cut up with deer tracks, and several does and fawns were disturbed by the passage of the men. Grouse went thundering away on all sides, and a great porcupine was disturbed in a nap, as he sat with his nose curled beneath his breast on an old root in some willows, a curious looking object.

Lunch was partaken of beside the little stream, in the shade of a clump of willows; pipes were lighted, and the country in which they found themselves was discussed.

"This bit of country," said Scribe, after he had gotten his pipe to drawing properly, "seems to be an almost virgin forest. If you have noticed the fact, and no doubt you have, there is not a mark of man's presence in it, excepting where a couple of logs have been cut near our camp. That was probably done by the timber lookers that you told me of, as the work seems to be just long enough done to coincide with the time of their visit. It is no country for bears, as there is no food for them. It is the same way with moose. There is no water in this direction excepting our lake, and that has no water plants in it for them to feed upon. Then see how tame the deer are, and the grouse and small animals. They will hardly get out of our way."

"Wal," F. answered, as he leaned back against a support of springy willows, "I'd figgered it aout 'bout the same. I don't think any one cud a been here an' not left some marks, an' as yu say, I hain't seen nary

a track o' man 'ceptin' the logs yu spoke on. An' I guess that accounts fur the size o' the fish, tew. There hain't many on 'em, seems 'ough, but they are all ol' sockers, what they is. It dums me good tu git into a place that hain't ben tromped over by ever'body, an' if I don't catch another dummed fish I'll allers be glad I cum."

"So will I," answered Scribe, "and the memory of this trip will be a joy to me as long as memory holds sway. If it were not so fearfully hot I would explore this country for miles around. It is a grand sensation to find oneself in a virgin forest, where no men ever come, and where all wild creatures are so little acquainted with man as to be practically unafraid. And I think much of this forest is virgin, as there is but little to draw even the red men into this solitude, excepting the plenitude of deer, and I fancy this latter has been brought about, lately, by the retirement of the timid creatures from more luscious pastures, being lured here by the peace which prevails."

Just at this point F. straightened up and quietly pointing to a spot behind Scribe's back, who sat opposite to him, whispered, "Turn yer head slow an' look ahin' ye! By the nation, if that ain't the purtiest site I ever seen."

Scribe did as directed, and not fifty feet away saw a mother doe, flanked on either side by a soft-eyed spotted fawn, curiously gazing at the two men. The doe would stamp her dainty foot and then turn to her offspring with a reassuring touch of her nose to each; then advance a step or two and stamp and gaze again.

"By gum, ain't they pooty!" whispered F. "It's the first time I ever see a deer so clost."

The men kept perfectly quiet, and the three beauties approached them gradually until within twenty feet, and then seemingly thinking that they were harmless objects, walked gracefully away, and soon disappeared behind the screening willows.

The men arose and walked quietly away, so as not to disturb them, and started back to camp, shooting six grouse on their way.

Rory had a grand potpie ready on time, heaped with feathery dumplings, and another grand feast followed in the course of the others that had been fattening all hands, since their arrival in this blessed land.

After this dinner and supper in one, and a satisfying smoke, fishing was tried again, but with small success.

F. had succeeded in capturing a frog, with which he retired to his favorite rocks, while the others went out in the boat. As the latter rowed down the lake they passed within a few feet of F., and as they did so he got a bite and struck with all the force of his pole. (It was not a rod!) It was soon evident that he was fast to a large fish, and a very lively one. He slipped in his eagerness, and landed hard on his back premises, losing his hat at the same time, which took advantage of the situation and promptly rolled into the lake. Just then an immense bass leaped into the air, and F. kept him coming by a tremendous sweep of his pole, landing the fish high and dry on the rocks and falling bodily on it.

It was a ludicrous but effective performance, and grasping the great bass, whooping and yelling at the top of his voice, F. danced a war jig and shouted, "Whoop! Whoop! Whoop-e-e-e-ee! That's the way to ketch 'em! Get 'em started, an' keep 'em a-comin'! Whoop-e-e-e-ee!"

Thus yelled the delighted man, oblivious to his bruises and his sinking hat, which was finally rescued by the boat's crew. The bass was a beauty, and was estimated to weigh anywhere from ten to fifteen pounds, by different members of the party. When placed upon the scales he dwindled a little, but still pulled down a plump nine pounds.

This was the only fish caught that night, and F. was many times congratulated on his luck.

The following day was to be the last of the outing, and all hands prayed for a change in the weather, as it was too apparent that no fish could be caught under the conditions then existing. Early dawn found all astir, but no change in the weather. T. caught one seven-pound pike, and Scribe a five-pound one, and that settled it. The forenoon was idled away in a game of cards, and the five-pound pike was baked in clay for the midday meal. The afternoon wore away in the same manner, and toward evening a slight coolness began to steal in, and finally a little breeze stirred the lake. A supper of fried grouse, hot biscuit and coffee was prepared and eaten early, and by the time supper was finished there was a good ruffling wind blowing. Scarcely had the boat got well started when T. had a fierce strike, and hooked and landed a ten-pound pike. At the same time more "whoops!" from F. announced that he was also busy. As the pike was hauled into the boat, F. was heard lamenting the loss of his fish, for which all hands were sorry.

"Blast his picter," he shouted, "he was a wallop in' big pike, an' he's took my gear, hook, line an' sinker. I'll bet a cud o' terbacker he'd weigh mor'n twenty paounds."

The boat had half circled the lake when Scribe's hook struck into something immovable, and remembering his first experience, he struck to make sure, and an immediate whirr of the reel told that he had a fish. Back and forth the great creature surged, taxing the skill of the angler to the utmost to keep a taut line with the single action reel. But no accident occurred, and after a stubborn fight the rod won the victory. As he lay in the bottom of the boat glaring up at his captor, he was indeed a monster. On return to camp it was found to weigh a strong twenty-nine pounds. F. caught another one that weighed fifteen and this ended the sport. All members of the little party proclaimed themselves perfectly satisfied, and retired early so as to break camp before dawn.

The breaking up of a happy camp is too sad a thing to dwell upon, and little more remains to be said, suffice it to say they all got back safely and parted with promises to go back together "some time"; but, alas! that "some time" has not come yet, and never will.

The following spring Scribe came to California, and has never been back since, excepting in memory.

Heigho! All this happened a third of a century ago, and probably the forest that was then so primitive and untamed, is now smiling fields of grass and grain, and the little lake has dwindled to a lifeless pond. It would break Scribe's heart to see it under such conditions, so he will ever keep it as it has been: a very dear memory.

This little reminiscence is as true in every incident as the author is able to recall it, and he hopes it will not prove uninteresting to the readers of "our paper."

AREFAR.

Monhegan.

Editor Forest and Stream:

I have just returned from a trip in which some of the readers of *FOREST AND STREAM* might be interested. A portion of it covers ground that is little visited, even by sportsmen, though why it is hard to say, for although isolated it is not hard to reach. It lies only twenty miles off the coast of Maine, namely, Monhegan Island.

The middle of last month found me at Waterford, on the upper waters of the Connecticut River, where I put up with an old friend. His place is eight miles from the railroad, with trout streams all around. The fishing this season is good, as almost all the streams are well stocked and posted, and being a little off the routes of travel are as yet not fished very hard. The fishing is greatly improved by the way the law is carried out and upheld.

The farmers are annoyed by the deer considerably; under the present law the animals have become a nuisance, destroying crops to a great extent; one farmer had two acres of beans destroyed and is bringing about negotiations with the State for the payment of the same. The deer were seen frequently feeding in the corn and oat fields within three hundred yards of the house, and when a gun was fired did not show any great haste to leave. One morning our attention was called to a large buck and doe in the corn field in front of the house. A little daughter, wishing for a nearer view, walked toward them until she came within fifty yards before she was observed, when the buck threw his head high in the air and advanced, stamping his feet in a threatening manner. The child became frightened at this, and let out a lusty scream, at which the deer trotted off in a leisurely manner.

Partridge are very plentiful and are little sought. 'Coons and hedgehogs are quite troublesome, and anyone wishing that kind of sport can have their fill.

After a ten days' stay here, I went to Portland, Maine, thence to Monhegan Island. The island lies off the central coast of Maine, far out in the sea, yet in the track of coasters and fishermen and passenger steamers. It is the most primitive, most fascinating, most ruggedly beautiful place in all New England. It contains a hamlet of one hundred fisher folk, the settlement is one and one-half miles long and one-half mile wide, and as yet is unspoiled by the vast army of summer pleasure seekers. The march of so-called improvement has not yet smoothed its one rough and picturesque street, nor borne in upon it a flotsam of cheap and ugly summer cottages. The neat and simple homes are still scattered in delightful confusion, as if dropped down through some celestial sieve; the thoroughfares are over ledges, hills, and pastures. The one horse enjoys the freedom of the town unmolested, and life here seemed one blissful dream of idleness for everybody. The scene on entering the harbor is magnificent. On the right rises the sharp slope over which are sprinkled the houses of Monhegan. Back of them tower the noble ever green heights crowned by the powerful lighthouse whose gleam of light is familiar to thousands who have never actually seen the island. In front and to the north is the little harbor filled with rocking dories and larger fishing craft.

On the left stretches Manana, which looks like a sleeping whale, a huge ledge rising over a hundred feet from the water, like a great rampart guarding the boats below.

Monhegan has an ancient history. It startles the visitor to reflect that he is standing in a continuous settlement older than Plymouth; that since 1607 it has existed with varying fortunes till this very day. The first sermon of New England in the English tongue was preached here on August 9, 1607, by the Rev. Richard Sigismont, chaplain to the Popham Colonies. The island was visited much earlier than this, for in 1605 Captain George Weymouth anchored his ship, the *Archangel*, and went ashore. After Weymouth many explorers dropped into Monhegan harbor. Most notable of them was Captain John Smith, who in April, 1664, made it the base of his operations for several months.

Fishing, which includes the catching of lobsters, is the only industry on the island. Day after day the dories go out in the mysterious hours of the morning and return in the forenoon laden with cod, haddock, hake, and pollock. Then all is activity along the two beaches on which stand the crazily picturesque fish houses, looking as if they had been tottering to their doom for the past hundred years, and had never quite determined to give up the ghost. The people of Monhegan are fishermen and the sons of fishermen. For two hundred years no industry has approached this, and the men of Monhegan have done nothing but catch, clean, and pack fish ever since they were big enough to handle an oar. The people are like one large family, with no aristocracy, no middle class, or any poor; "share even" seems to be the ruling motto in business.

Every inhabitant owns a fishing boat, and can handle her through a living gale in a manner to win admiration. There are subscribers to newspapers and leading magazines, with plenty of time for reading; and they are remarkably well informed and cultured.

In the fall and winter months all kinds of duck and geese are in great abundance. Monhegan lighthouse stands upon the most commanding land of the island, though far removed from the dashing roar of the sea. The lantern rises 175 feet above sea level. It displays a white light of great power. In the darkest night the beam pierces the gloom like a great meteor. With Seguin twenty miles to the westward and Matinicus Rock the same distance to the east, the light forms the outer cordon of lights which illuminate the coast and warn ships from danger.

Last season's catch of lobsters was 60,000, which sold

at an average price of 19 cents apiece, and the season's catch of fish was about 3,000 quintals or quintals, at \$3 per cental.

As the island now stands a fine sense of equality pervades everything. Acquaintances are easily and simply made, because it is somehow felt that the unworthy do not get so far out to sea. There is as yet no dressing for dinner, nor kindred vexations. Instead, there is a quiet good fellowship with a rational enjoyment of the gifts of nature, the most intimate acquaintance with the sea and the tonic of its air. A sojourn of but a week makes one love the little island, and when the day of parting comes and one sails away he keeps his eyes fixed tenderly on the blue heights so long as they appear above the horizon, almost pathetic in their brave isolation, a tiny speck out there in the sea.

H. L. SHAW.

PHILADELPHIA.

Packing Without Profanity. ■

Editor Forest and Stream:

The editor, in the number for July 25, has something to say about Technical Language, as applied to pack mules, and concludes by giving his opinion that had the party, who was offended at hearing this language used, objected to its use at the time he first heard it, he would not have heard any more of it. This affair is a good deal like one that happened when I had the pack train, or rather another train, and its swearing packers, and it only took me a few minutes to stop all swearing, not only then but for the rest of the trip. In the spring of 1871 two English tourists came to us at Fort Richardson, Texas. They brought letters of introduction to the commanding officer and wanted to hunt buffalo. I was given a detail of 10 men, 7 for the escort and 3 to pack and drive the mules; and was told to take the men out for 10 days or more and find them the buffalo.

We had 7 mules packed with rations and a company outfit. We carried no tents with us, but I took two tent flies to put up in wet weather and had them put up each night while we were out, whether it rained or not; it would be less trouble to put them up and take them down in the day time than it would be to put them up in a rain storm after night. Except for these flies, we and the tourists roughed it; they fared just as we did. One of them was an English lord, the eldest son of a duke, and he had been a captain in the English cavalry and seemed to be at home here. This just suited him, he told me. The other one, a cousin of his, was a vicar in the Church of England, and it was on his account that I stopped the emphatic language. They both carried English rifles, but had the new Smith & Wesson army pistol .45 caliber. These were the first I had ever seen, but a short time after this I had one myself, six of them being sent us to experiment on and report on to the War Department.

Fort Richardson was built just outside of Jacksboro, Jack county, that was at that time away out on the frontier, and I led the party directly west, meaning to strike the Brazos River first, then cross it and keep on southwest as far as the Double Mountains, at the head of the Salt Fork of the Brazos, as from about the Brazos to the mountains and west of them was a good buffalo country, though we often met them within 50 miles of Jacksboro. No escort would be needed now to hunt in that country, but at that time it was not safe to travel anywhere in it without an escort; the Kohawdi Comanches had this part of Texas all to themselves and were on the warpath. This troop of ours put them off it, though, the next year after this, after we had killed about half of them.

When leaving the post I told my packers to keep their mules close up behind us at all times; I did not want to have to charge a party of Indians in order to recover the mules some day. A mule would stray off the trail, then stop to study botany or eat grass, and would get a cursing for doing so. Then another would take a notion to lie down and try to roll off his pack, then he would get more of this emphatic language. The most of the mules happened to be females; they are, if possible, always meaner than a horse mule; and all of them had names; they were our regular troop pack mules; and each mule would be addressed personally, then damned to the lower regions and half way back again, in each string of oaths that would be fired at them. Had there been an officer here we would have had none of this cursing, he would not have allowed it, and had these strangers not been here they might have kept on cursing for all I cared; I had driven mules myself and knew that the mules needed it; but I soon made up my mind that it must stop, and dropping back to the pack train, I told the men to stop it and to begin right now. They stopped it.

After we had camped the first night this minister says, "Sergeant, I, of course, have often heard the expression used to 'swear like a trooper.' Those troopers of yours seem to be adepts at it."

"Yes, sir, they are; but they will practice it no more on this trip; I have stopped it; you won't hear any more of it. It is rather hard for us to handle mules and not swear at them; but it can be done."

That evening, while at supper, I said, "Now, men, while we are on this trip don't let me hear any more swearing at anything. There is a minister along with us, remember; and he does not want to hear it. Drive those mules for once without cursing them. It can be done. Use your lariats on them, I will never punish a man for whipping a mule. The mule may not need all you give him just then; but he will need all he gets then some time else. It won't be wasted on him; let him have all you think he needs. But never strike a horse while you are with me if you don't want a stringing up for it."

That minister, after he had got home, would no doubt write out his impressions of this country, and I did not want him to give an account of how I had hung a man up to a tree by the wrists for damning a mule. This was a regular mode of punishing men then; it has been stopped though, long since.

We found the buffalo on the third day. After going into camp that day at 3 o'clock, Lord C— and I

started off to look for them, leaving the camp in charge of one of my men. About three miles west of camp we came in sight of half a dozen small bunches of buffalo scattered around and quietly feeding. I had his Lordship change horses with me, for while I knew that my horse would carry him right alongside of the buffalo, I had my doubts about his doing it. Then I told him where to shoot to kill, and we started, and got to within a few hundred yards of the buffalo before they ran off. My horse put his rider right alongside of a young cow, and Lord C— shot her. I was up here but did not fire; one would be all we wanted; their hides were of no use to us at this season of the year.

We partly skinned the cow, then cutting off what meat we could carry went back to camp, and I sent out men and a mule to bring in more meat.

"How long do you expect to find these buffalo in your country, sergeant, before they all disappear?" he asked.

"I expect them to be still here after I have died of old age, sir. This whole country west of this clear to the Rocky Mountains and from Canada to Mexico, a territory almost as large as all Europe, is still covered with them."

"I am afraid you will see the last of them long before you die of old age, sir. I have been in India and know how soon this big game disappears, once we start to hunt it."

Just nine years after he had told me this I saw the last of them go.

We went as far west as the Double Mountains at the head of the Salt Fork of the Brazos, and were out fourteen days instead of ten, got all the buffalo we wanted and passed thousands of them that we did not want, and got home without having had any mishap to any of us.

The more I saw of this Englishman the better I liked him. He put on no airs with us, he had not been with us two days before he knew the name of every man in the party, and always addressed each man by his last name; no man ever hears his first name in the army. There was no "me mon" with his Lordship, our men thought that he did this because he knew that he was not in England now and that "me mon" did not go here. "No," I told them, "he does it because he happens to have been born a gentleman, and never forgets that he is one, either."

SOLDIERS' HOME, Erie, Pa.

Natural History.

Our Batrachians and Reptiles.—VI.

It is a very general impression that a venomous snake may readily be recognized by its thick, clumsy body, short tail, small neck and large, flat, triangular head, but this, like many other popular beliefs, is open to objection. It was pointed out in the preceding chapter of this series that certain perfectly harmless snakes have stout bodies and large heads. Moreover, there are some very dangerous snakes with slender bodies and small heads, which, unless the observer is acquainted with the species, would almost certainly be regarded as innocent. How, then, may a venomous snake be recognized?

In a recent paper entitled, "The Poisonous Snakes of North America" (published in the Report of the United States National Museum for 1893), Dr. Stejneger has defined as venomous "all those snakes which are provided with a specific poison and an apparatus especially adapted for the introduction of this poison into the wound of the victim." Now, the existence of a specific poison is a fact which can be determined only by noticing the effect of the snake's bite on some living animal, but the special apparatus for its introduction into a victim can readily be found. All venomous snakes are provided with poison fangs.

If, at his first opportunity, the reader will examine the mouth of any harmless snake he will find in the upper jaw four long rows of sharp teeth. The two outer rows are on the upper jaw bones and those of the inner rows are borne by some of the bones which form the roof of the mouth and the palate. These inner rows of teeth are also to be found in a venomous snake, but the outer row is represented on each side by usually a single very much enlarged tooth which is deeply grooved or even pierced by a slender longitudinal canal like the needle of a hypodermic syringe. This is the poison fang. It is always much larger than any of the other teeth and stands alone, except for a cluster of reserve fangs hidden at its base. It may be situated either at the extreme back or the extreme front of the jaws. It is connected at the top with a canal from the poison gland so that, when a bite has been inflicted, a quantity of poison can be squeezed out through the groove or canal deep into the wound. The reserve fangs are provided so that in case the one in use is broken off another may soon rise up to replace it.

The poison of the venomous snakes differs greatly in its action and somewhat in its appearance, according to the snake from which it has been taken. It is secreted by certain glands situated at the sides of the upper jaw, and is a transparent, yellowish or nearly colorless, sticky fluid, tasteless and with no appreciable odor. Chemically and physically it is much like the white of egg. Its virulence is not destroyed by drying, freezing, boiling, or treatment with alcohol. It may be rubbed on the unbroken skin or taken into the stomach with impunity, but if introduced into the blood in sufficient quantity causes great nervous prostration, interferes with the action of the heart, paralyzes the respiratory and digestive centers, and produces death.

Leaving out of consideration the snakes which have grooved fangs at the back of the mouth, and which are hardly to be regarded as capable of inflicting a dangerous bite, except to small animals, we will find that the truly venomous snakes of our country, those which are dangerous to man, are of two different types. Both have their fangs situated at the front of the upper jaw bone, but while in one group, which we may know as the coral snakes (family *Elapidae*), these fangs are fixed and permanently erect; in the other, which are commonly called

the pit vipers (family *Crotalidae*), they are movable, and when not in use may be swung back out of the way against the roof of the mouth.

The coral snakes are represented in our fauna by only two or three species. They are long, slender animals, with small heads and with their bodies very conspicuously, even brilliantly, marked with vermilion red, black, and yellow. These colors are arranged in bands which encircle the body, their width and number varying somewhat according to the species and the age of the individual. In the harlequin snake (*Elaps fulvius*), which is by far the commonest representative of the family within our limits, the red and black bands are of nearly equal width and much broader than the yellow bands. In the Florida coral snake (*Elaps distans*), the black and yellow rings are of nearly equal width, and the red is correspondingly increased. The harlequin snake has a rather broad yellow band encircling the middle of the head, while the Sonoran coral snake (*Elaps curyxanthus*) has almost the entire head black; in the latter species the tail is only about one-fourteenth the total length, while in both the other species it is about one-seventh.

The Sonoran coral snake apparently occurs within our limits only in Arizona, and does not seem to be common even there. The Florida coral snake is very rare in collections and may possibly be only a peculiar variation of the harlequin snake, which is found in the same region. The harlequin snake, however, is found not only in Florida but as far west as Texas and as far north as southern Ohio and central Missouri; in the southern portions of this range it seems to be rather common.

As to the habits of these interesting snakes, we know

it should be handled with great care. It would seem that animals so conspicuously marked as the coral snakes should be very easily recognized, but, unfortunately, in the region inhabited by them, there are several perfectly harmless snakes which imitate them so closely that even a person fairly well acquainted with reptiles would need to look twice before deciding upon their character. Of course, if the snake is dead an examination of its teeth would settle the question at once, but if it is alive the matter becomes more difficult. The observer will have no trouble, however, if he will remember that in the coral snake the black rings are bordered on each side with yellow,

Fig. 3.—Side view of skull of Rattlesnake.

low, while in its imitation the reverse is the case, the yellow rings being bordered on each side with black. Coming now to the pit vipers we will find that this family contains the remaining species of our venomous snakes, about fourteen in all. They are strongly marked, repulsive looking serpents, usually sluggish in habits, and to a great extent devoid of the grace which is so characteristic of other kinds. Their head is rather large, in some cases markedly so, and swollen at the back so as to be more or less triangular, but this outline is not fully carried out, for the nose is blunt and rounded. Compared with the size of the head, the neck is somewhat more slender than in the harmless snakes and the body is stouter and more clumsy. The distinguishing character of the pit vipers, however, and the one which has given them their name, is a deep pit which is to be found on each side of the head between the nostril and the eye. No one has yet been able to tell the use of this pit. It is not connected in any way with the poison apparatus nor with the nostrils. It is possibly the seat of a sixth sense, a supposition which is supported by the fact that the pit is abundantly supplied with nerves. It might also be remarked that the pit vipers are to be distinguished from our other snakes by the fact that most of the plates on

Fig. 4.—Side view of head of Rattlesnake.

the under surface of the tail are undivided like those on the belly, while in the harmless species they are arranged in two rows. Of course it will be necessary to apply these finer details of construction only in the case of the water moccasin and copperhead, for the rattlesnakes are instantly to be recognized by their rattle.

All the pit vipers bring forth their young alive, but, so far as is known, the broods are small, less than a dozen being produced at one time. For a time after birth the young are probably cared for by the parent, and, in some cases, at least, have been known to escape danger by running into the mother's capacious gullet.

The copperhead (*Agkistrodon contortrix*) is not an uncommon snake in many parts of the Eastern United States. It has been found as far north as central Massachusetts, as far west as Illinois, and as far south as southern Georgia, Louisiana, and Texas. On account of its sinister reputation few would think of the copperhead as a beautiful snake, but among those who can recognize beauty even in a reptile, this one is regarded as most exquisitely colored. It is, however, a snake to be greatly dreaded, for it seems to be more aggressive and more active than the rattlesnake, and inflicts its bite without warning. Perhaps to compensate for these facts nature has given to it a venom less virulent than its more noisy relative, the rattlesnake, and death from its bite is a very rare occurrence.

The water moccasin (*Agkistrodon piscivorus*), as its name implies, is a frequenter of water courses, and as

Fig. 5.—View of the lower surface of the tail of a harmless snake.

such is found from Texas northward to southern Illinois and the great Dismal Swamp in northeastern North Carolina. It does not occur in the mountain streams, but in the lowland rivers and bayous of the Southern States it becomes at times abundant. It is a larger and heavier snake than the copperhead, and is probably quite as ready to make an attack on anyone who comes within its reach. Its venom is the least dangerous of any of our poisonous snakes, but from the fact that the large size of the snake insures an abundant supply of the poison the bite is

probably quite as severe in its consequences as is that of the copperhead. The name "cottonmouth," a common appellation of the water moccasin in some places, is given on account of the white lining of the mouth, which is conspicuously exposed when the snake opens its jaws to bite.

The rattlesnakes, as has been already stated, are easily distinguished from all the other venomous snakes by the fact that in these the end of the tail bears a peculiar horny, jointed structure which, when rapidly vibrated, produces a rattling or whizzing noise very similar to the song of the cicada or the grasshopper. Aside from this structure, however, they show a number of differences which have led zoologists to divide the group into a number of genera. Only two of these are now commonly recognized: *Sistrurus*, containing three rather small species known as the "ground rattlesnakes," and *Crotalus*, containing about seventeen species (ten of which occur within our limits), which may be known as "true rattlesnakes." The ground rattlesnakes may be distinguished at once by the fact that the top of the head is covered with large, plate-like scales much like those on the heads of the harmless snakes, while the true rattlesnakes have the top of the head covered with small scales like those on the body except for a few larger ones on the snout in front of the eyes. The ground rattlesnakes, two kinds of which occur within our limits, are rather smaller than most of the species of the genus *Crotalus*, and on that account are less dangerous, but their bite would, to say the least, be very unpleasant. They occur over a wide extent of territory, from New York to Wisconsin and Nebraska, and southward to Texas and Arizona.

It will be impossible here to speak in detail of any species of the true rattlesnakes, notwithstanding the great interest which centers about them. They occur over the greater portion of the United States in favorable localities, some species distributed very widely and others very

Fig. 6.—View of the lower surface of the tail of one of the Pit-vipers, showing the undivided urosteges.

locally. They are especially abundant in the States which lie on the Mexican boundary, not less than eight species being known from that region. Further to the northward the number rapidly diminishes, and most localities possess but a single species. They live in all kinds of places, but are naturally exterminated very quickly in the open ground, and hence are now most often found in woodland or among rocks.

The largest is the well-known diamond rattlesnake of Florida and the adjacent States, which reaches a length of over eight feet, but there are in the Western States several species which do not reach a length of more than three feet. Almost all of them are strikingly colored. Usually the ground color is yellowish, brownish, or reddish, and on this are spots or blotches or bars of darker. One species, the "white rattlesnake" (*Crotalus mitchellii*), is grayish yellow with small brown dots, while another, the green rattlesnake (*Crotalus lepidus*), is grayish green with rather broad, jet black bands. In the southwestern part of the country a species (*Crotalus cerastes*) is found which is peculiar in having a small horn over each eye.

The venom and the poison apparatus have probably been more thoroughly studied in the pit vipers than in any other venomous snakes and the pages of FOREST AND STREAM have already contained several articles on the subject. Nevertheless a brief resumé of the matter may be of interest.

The mechanism of the fangs, the muscular arrangement

Fig. 7.—Side view of the head of a Rattlesnake dissected to show the poison apparatus.

for moving them, and for injecting the poison at the proper time can perhaps be understood by referring to some of the accompanying figures, but the poison itself is of such a complicated character chemically that it is still but poorly understood. In appearance it is indistinguishable from the venom of the coral snakes, but its action is much more rapid. In fact, if a considerable quantity is injected into the blood of an animal the effects are almost instantaneous.

Some years ago the author had in his possession a specimen of the common rattlesnake of the Eastern States (*Crotalus horridus*). It was a diminutive individual, about nine inches long, one of seven found under a stump near Cumberland, Maryland. When first brought in it was ready to strike at anything offered to it. One day two young mice were put into the box in which it was confined, and almost immediately one of them was bitten as it ran past the snake. The fangs seemed to penetrate just behind the neck and before the mouse had gone six inches further its hind legs were paralyzed, and it dropped dead within half a minute. Soon afterwards the second mouse was bitten, this one in the side; but the action of the poison was the same, and death followed as quickly.

Although the bite of any one of the pit vipers is exceedingly dangerous to man, it is not necessarily fatal, for much depends upon the conditions both of the snake and of the person bitten. The stock of poison carried by one of the reptiles is small, and if it has been exhausted by a recent attack upon some other animal a sufficient quantity may not be on hand to produce death. A child or a weak person will succumb more quickly than a strong healthy man. Furthermore, if the bite is inflicted on a part of the body in which the circulation is

Fig. 1.—Diagram to show the arrangement of the teeth in A, a venomous snake; in B, a harmless snake.

comparatively little, as even the most common species is of a retiring nature, and seems to spend most of the time hidden under logs or burrowing about in dry, loose earth. As a group, they are believed to feed largely upon other snakes, but have also been known to eat mice, lizards, and possibly insects. In one case a harlequin snake was caught in the act of swallowing a black snake as long as itself, and when dissected was found to contain a partly digested garter snake.

Dr. Einar Lönnberg, of the University of Upsala, in Sweden, visited Florida some years ago, and while there had an opportunity to observe the harlequin snake. He regards it as perhaps the most dangerous species in that State, not even excepting the diamond rattlesnake. He says: "It is regarded as a 'pretty little snake.' Few people know or believe that it is poisonous, it looks so harmless, and as a consequence they catch it and handle it roughly; the snake gets angry, bites, and a human life is endangered. I know personally of such a case. A Swede at Oakland, Orange county, found an *Elaps*, and

Fig. 2.—Side view of skulls of a harmless snake and a coral snake; q.u., quadrate bone; e.s., eye socket; t., teeth of upper jaw; f., teeth of lower jaw; f., fangs.

because of its beautiful color he caught it and tried to put it into a bottle of alcohol. The snake bit him, but the wound was not large, and as it did not swell he did not care much about it at first. After a while he was taken very sick, went to bed, asked for a physician, and drank whisky; but it was then too late. He died the next morning, about twelve hours after the snake had bitten him. During the last hours he was unconscious, but before that he suffered the most excruciating pains. I have heard of several other cases of boys dying from an *Elaps* bite. In other cases people have been bitten by an *Elaps fulvius* without suffering from it in any way, but I suppose that in such cases the *Elaps* had not been able to inject any poison into the wound, as it has a rather small mouth." Dr. Lönnberg's statement, as well as the records of a number of similar cases, show that the action of the poison of the harlequin snake is slow compared with the very rapid action of the poison of our other venomous snakes. There is also little or no local effect. The wounds made by the fangs are small, almost insignificant, and the part bitten does not swell much, but the poison is absorbed and in an hour or two begins to show its effects. The method of inflicting the bite differs greatly also in the harlequin snake and the rattlesnake. The latter lunges forward, drives its fangs into its victim by the force of the blow, and immediately draws back; the harlequin snake seizes a suitable part and hangs on, seeking to work its fangs deeper into the flesh, and often has to be pulled away.

Under ordinary circumstances it is a good natured snake and does not attempt to bite, but, when encountered

poor, the poison can be removed or counteracted before life becomes extinct.

The treatment usually advocated in cases of snake bite is to ligature the part bitten and fill the victim up with whisky, but there is good reason to doubt the efficacy of this procedure. The action of alcohol in large doses is such as to assist rather than combat the action of the venom. The first step to be taken in all ordinary cases is to ligature the wound and then to remove the venom, either by sucking it out, or by opening the bitten part so that it may escape with the blood. At the earliest possible moment a solution of one part of chromic acid to 100 parts of water or a solution of chloride of gold or permanganate of potash of the same strength should be injected with a hypodermic syringe into the wounds and the surrounding tissue. Alcohol may now be administered in small doses as a stimulant, and an effort should be made to induce a profuse perspiration. In cases where there seems imminent danger of collapse, hypodermic injections of strychnia are recommended, even in doses which under ordinary conditions would be fatal. The services of a skilled physician should be obtained at the earliest possible moment.

Fortunately all the venomous serpents are disappearing before the onward march of civilization. The opening up of a country to agriculture affords them fewer opportunities for a retreat from danger, and man always brings with him domesticated animals which destroy the snakes even more thoroughly than he can by his own efforts. Doubtless some of these reptiles will withstand this invasion for many years to come, but in the end they all must go, and then, perhaps, the harmless snakes will cease to suffer for the bad company which they are now forced to keep.

W. P. HAY.

Language of the Lower Animals.

Editor Forest and Stream:

In FOREST AND STREAM of June 6, Hermit expressed his opinion, in regard to the alleged speech of animals, as follows: "I do not believe that the speech of the lower animals is inherited. It would be just as unreasonable as to claim that human speech is inherited." As it is a self-evident fact that speech must be either inherited or transmitted by instruction, and as it seemed plain that he used the term speech as synonymous with language, I ventured to state (see FOREST AND STREAM of July 4) that I knew of nothing to indicate that these animals either possess or used a language that can be transmitted by instruction. In other words, I stated that I knew of nothing to show that the animals possess any speech or language which is not inherited; and I virtually asked for the production of reliable evidence to the contrary, if any such is available. In FOREST AND STREAM of August 8, Hermit gives another interesting account of his observations, in which he takes enough notice of my communication to show that he does not perceive the points to which I tried to call attention. He says: "Your correspondent, I. W. G., makes much of the bawl of a frightened calf which brings the nearby herd to the rescue. * * * These hereditary functions are out of place in this discussion. There is no dispute on this line. * * * It is not language but tone that brings the herd to the rescue of the calf. Even I. W. G. could recognize the note of terror in the calf's cry, although he might be wholly ignorant of the bovine language." Now, as a matter of fact, it is just these "hereditary functions" that I wish to have in the discussion, for the purpose of either identifying them as the "bovine language" or distinguishing that language from them. From my point of view, they must remain in the discussion until Hermit, or someone else, displaces them by demonstrating the existence of a better "bovine language." I think Hermit will agree that in a general sense, or for our present purpose, language may be defined as any means by which ideas are communicated, from one individual to others. It is obvious that the bawl of the calf conveys a crude idea to the cattle. It is the "note of terror" that conveys the idea that the situation demands. And if the needs of cattle, in regard to language, are supplied by various impulsive tones, actions, and postures—"hereditary functions," as Hermit calls them—it follows that the "bovine language" consists of "hereditary functions." If cattle have a language other than these "hereditary functions," by all means let us have a definite and verified description of it, and that much of the controversy will be disposed of at once.

Hermit tells us that a kitten was taught by the cat to anticipate the approach of a butcher cart by signs made by the cat as she watched by the window. But he does not even attempt to prove that these alleged signs were anything more than the expressions of listless waiting, and of eagerness in view of approaching gratification, which are practically involuntary, or "hereditary functions," and which the kitten understands by what may be called heredity or intuition. If the cat instructed the kitten in the language of signs, how did she do it? If Hermit affirms that the cat told the kitten beforehand that her ears pointed forward would mean one thing, and when they were pointed back it would mean something else, he should be able to describe definitely the process by which the cat communicates this information. How does the cat say to the kitten, "While the wagon is not in sight I will hold my ears back, and when I see it coming near I will point them forward?" If Hermit does not know how it would be possible for the cat to make a previous arrangement of this kind with the kitten, how does he know that such an arrangement was made? Is he quite sure that the kitten did not perceive the approach of the wagon by scent or sound on its own account? He does not need to be told that the senses of smell and hearing in some of the animals are surprisingly acute in comparison with the same in us human beings. But in regard to general perception and imagination, man is the most abundantly endowed of all animals, and when one, who is a warm advocate of a certain theory, essays to serve as the eye of accurate knowledge, he needs to hold a tight rein on his own perceptive faculties, in order to keep himself from seeing more than there is to see.

Hermit also gives an instance of a cat not mewing until it had the company of another cat, and, in effect, asks us to accept it as evidence of the necessity of instruction. As several correspondents of FOREST AND STREAM have given many instances of animals making

the distinctive cries of their species without the possibility of instruction, it will be necessary for him to explain these cases out of his way before he can reasonably expect the abnormal action of one cat to be overwhelmingly convincing. When we see numerous animals performing certain functions without instruction we have positive evidence that they do not require instruction; but the fact that a single cat does not mew in orthodox fashion until late in life is no evidence at all in regard to cats as a species. There are abnormal beasts just as there are abnormal human beings. Moreover, doing a thing is positive evidence of the ability to do it, while not doing a thing is, of itself, at best, but negative evidence of the lack of ability. And will Hermit please tell us why the bawl of a calf is more an "inherited function" than the mew of a cat? If the mew of a cat is pertinent to this discussion, why is the bawl of a calf impertinent?

It is necessary to bear in mind that the question is not whether the lower animals have a language. It is admitted on all sides that they do communicate crude ideas to each other, and this could not be without some sort of a language. It is not even doubted that they can be instructed in language. It is a matter of common experience that nearly all of the animals can be instructed, some more, some less, in human language. But the point of significance here is that both the instruction and the language are outgrowths of the intelligence of man. A horse, for instance, is taught to start, to stop, to back, etc., etc., at the command of the human voice. This undoubtedly requires a considerable degree of intelligence on the part of the horse. But the horse has no control of either the instruction or the language. The horse never makes the human sound which he associates with the action, and hence horses never communicate this language to each other. The instruction is all by the intelligence of man; and the language is formulated and used entirely by man, and for the benefit of man.

The question before us is simply whether the lower animals have languages of their own which they themselves can transmit or perpetuate by instruction. Some naturalists enthusiastically and positively declare that they have. Others, and some of us who are not naturalists, ask for the production of substantial evidence. Let it be noticed that such a language would require the animals to have a previous arrangement, or conventional understanding, in regard to the sound, motion, or posture which is to represent each thing. Human languages can be transmitted by instruction only because they are based on human conventions; that is, on mutual prearrangements and understandings. Each human language is developed by the development of civilization and the needs of the people. A language which is based on convention—on general consent—is at the command of those who use it, and can be changed at their pleasure. This is the case with all the human languages. Each word is associated with the thing it represents, and is adopted into the language by the exercise of volition and intelligence. If the lower animals have not a language based on convention—if each sound, movement, or posture, is not associated with the thing it represents by intelligent prearrangement and mutual consent—it is obvious that the language cannot be transmitted by instruction. If they have a language based on convention, where is the evidence? How would it be possible for any species of animals but man to make the least change in its language by the exercise of volition and intelligence? And, if they have not sufficient intelligence to change their language, how can they have sufficient intelligence to communicate a knowledge of it to each other by intentional instruction?

I. W. G.

Observations on Birds.

Editor Forest and Stream:

Early in June of this year a catbird came every morning at the first light to an apple tree near my window and woke me with his song. All day long he could be heard in some part of the grounds, often singing on the wing in flight from one tree to another. His favorite perch was on the dead limb of a tall locust tree near the apple tree where the nest is located. While on this perch every note was given as clear and distinct as a bell, and without a slur. Sometimes it was the full notes and trills of this bird, at others a clear and distinct whistle, or the notes of the meadowlark, whippoorwill, robin, etc., but when in the tree with his mate, the notes were soft and low as a love song.

Last week, after his morning song, he stopped singing, and has since been silent. We looked about for the cause and found that the birds had hatched their young. It seemed apparent that bird had found that his notes would not buy insects for his family, and, like a sensible father, had gone to work. We now see him flying in and out of the tree with his mate carrying food to their young.

It has been our custom for a long time to throw crumbs in the yard near the balcony to feed the birds which come there for them each morning. One day this week a chipping sparrow brought with her a young one quite as large as herself, and commenced to feed it small particles of crumbs. The young one was ravenous, and ate piece after piece as given it by the mother, but would not pick up the food from the ground. After a time the mother gave it a very large piece, so large that the young one could not swallow it, but bit a piece from the cracker and let the balance fall to the ground. Although directly under the young one's bill, it would not pick up the piece, but fluttered on after its mother. She gave it another large piece, and again it dropped a part of it. The mother picked this up from the ground, and when the young one dropped it next time, it picked it up of its own accord, and after that it began to eat from the ground freely, and when quite satisfied flew away.

One day among the bread and crackers given the birds was some corn bread; but all the birds coming to feed—among them a scarlet tanager—rejected the corn bread, and the chippy ate only of the crackers. The afternoon following her teaching of the young one to eat bread, the old sparrow brought another young one and attempted the same tactics, but the young one was either too stupid or too young to be taught, and had to be fed until it flew away.

At another time we saw the mother feeding a young

one, which was evidently older than either of the two others spoken of, quite a good sized worm. The young sparrow took it from the mother crosswise, when the mother immediately took the worm again from the young one's bill and turned it around so that it could be swallowed endwise.

While walking in the woods near our house we found a young olive-sided flycatcher, just from its nest and unable to fly more than two or three feet at a time. The mother bird was much distressed, and flew about making a peculiar cry. The young one fluttered to a low bush, when the mother rewarded it with an insect which she picked from the ground. The mother then called from a low shrub nearby, and the young bird tried twice to reach it, but each time fell short, and went back to the bush, but the next time the young one attempted it, it caught with its claws on a limb of the shrub, and after one or two attempts succeeded in reaching the limb, which was about four feet high. After each attempt the mother gave it food. On returning that way two or three hours after, I found the young one well up in a cedar tree. The mother appeared to be perfectly happy, and the young one always ready for its insects.

What is intelligence and what instinct?

Why should a bird be afraid of a crow or a hawk and not afraid of a hen or a dove? Why should it be afraid of a cat or dog and not afraid of a pig or a hare?

I suppose it is experience combined with teaching.
E. R. W.

OYSTER BAY, L. I.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

CHICAGO AND THE WEST.

Migration of Prairie Chickens.

CHICAGO, Ill., August 15.—There is reason to believe, as has already been mentioned, that we shall have a fairly good season of prairie chicken shooting in Wisconsin, Minnesota and both the Dakotas this fall. Whether or not we call high license a theoretical or practical success, either the high licenses or the growing sentiment in favor of game protection is slowly beginning to work a benefit in the matter of our upland game supply in these Western States. It is believed that plenty of good chicken country will be found for those who are willing to enjoy themselves temperately on our Western prairies this fall.

Most of this chicken shooting will be over by the end of the first week in September. That is the hottest and hardest part of the prairie chicken season, and one which ought to be least attractive to the upland shooter. The hot weather is hard on the dogs, and birds, although fairly well grown, are by no means so strong in the first week in September as they are ten days or two weeks later. From a keen shooting standpoint, the wonder is that so small an interest attaches to the sport of upland grouse shooting in late September and October. An old time chicken shooter of Chicago said to-day:

"If I wanted to have a really good chicken shoot, I would not cry over the fact that we can't shoot in Illinois for several years. Neither would I go out to Minnesota or Dakota. I would wait until about October, when the stormy fall weather begins, and then I would go out into northwestern Iowa, say in the country along about Spirit and Okoboji lakes. Understand, I don't say that this is a good country in the early fall. I only say that it is good when the storms have driven the chickens out of Dakota and Minnesota.

"Some say that this migration of prairie chickens does not exist, but any well posted man who has shot in the West knows that these birds do move out of Dakota every fall and go north again in the spring. I have seen them in droves of two or three hundred flying low and strong. When they get into a country which suits them they scatter among the corn fields, and then they offer shooting for the man who understands how to get them, and it is shooting on good big birds and under sporty circumstances. I would rather have this shooting on migrating birds just at the end of fall and the beginning of winter than to kill any number of these half developed young birds which anybody can stop in August or September."

Automobilist and Woodcock.

On July 4 Mr. N. Landon Hoyt, son of the Chicago merchant, Mr. W. M. Hoyt, took a friend in his automobile and started out along the roads which run north of Lake Bluff, a suburb above this city and not very far from the Skokie Marsh, which, as is well known, sometimes affords a bag of snipe or woodcock. Mr. Hoyt was lucky or unlucky enough to kill five woodcock. He was followed by wardens Thayer and Edwards, who arrested him and his friend as they came back to the automobile, the birds being confiscated. The case came up for trial before Justice Boyer at Evanston last Monday, and Mr. Hoyt was fined \$15. There had perhaps been intercession made with the powers that be, since, for some reason, State Game Commissioner A. J. Lovejoy wired the justice asking that the fine be made \$15. The justice thereupon imposed that fine, covering one bird. It would seem that a gentleman able to go about his sport so comfortably, not to say luxuriously, might have been able to stand the additional \$60 for the four woodcock on which he did not settle. There is talk about reopening the case, but it is difficult to see how this can be done at this date. It is to be said in favor of Mr. N. Landon Hoyt that the woodcock which he is reported to have killed are said to have been quite clear of all adhering portions of shell, and that none of them was killed while sitting upon or adjacent to the nest which brought it forth. The whole matter is the fault of the age, not of Mr. Hoyt. An automobile is fast, and hence its owner may sometimes be a little sooner.

Tip on Chickens.

The Richardson brothers, of this city, this week shipped

3,000 shells to the town of Linton, North Dakota, where they propose to go chicken shooting. With 3,000 shells one can kill a good many birds, hence, perhaps, there may be a good many birds to be killed at Linton.

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

Game Preserves.

TORONTO, August 15.—*Editor Forest and Stream:* I have been much interested in the able controversy on the question of private game preserves that has recently taken place in FOREST AND STREAM. While there is no law to prevent rich men from acquiring large tracts of land from private parties—nor do I think there ought to be—I am decidedly opposed to wealthy men being allowed to obtain possession of large portions of the public domain for game preserves, to the exclusion of the general public.

The hunting and fishing instinct is as strongly inherent in the men who constitute the backbone and sinew of our respective countries as it is in the millionaires. This being an admitted fact, is it right, or is it good policy, that the men who are building up our respective countries, and the men whom our countries would have to depend upon for protection and defense from troubles resulting from international complications, should be debarred from indulging their love of field sports for the sole benefit and interest of the wealthy minority? No doubt game preserves have become an urgent necessity, and they should be established in the most suitable localities in our respective countries, and by our respective governments, in the interests of all, and not for the benefit of a few. God forbid that old country systems should ever prevail on this free and manhood making continent. If we desire to increase anarchy and dissatisfaction, allow the rich men to acquire all the best hunting and fishing grounds in our countries, fence them from the roads and stick up trespass notices, and by so doing we will succeed in building up a dangerous menace to our countries that will have disastrous and lasting results. The great throbbing mass of humanity requires a safety valve, and if we fail to protect the one nature has provided, and keep it in good order, trouble will follow, and, as with boilers, the explosion will occur when least expected.

When a boy in England, in the forties of last century, I have seen gangs of scowling men from the towns on the highways, and have heard their muttered threats when seeing the landowners shooting over the fields that they were not allowed to place a foot on without endangering their liberty. I have seen miles of forest lands on fire during the nesting season of grouse and partridge, the result of class legislation. The same causes will produce more intensified results in America, owing to its cosmopolitan population, and it will be well for the future of our respective countries if those charged with the administration of public affairs realize before it is too late the urgent necessity of setting apart a number of forest reserves available to the general public for all time. It is a safe policy for all governments to largely legislate for the masses. The classes will look after themselves.

RANGER.

Editor Forest and Stream:

I feel like the victim of a cyclone, and my fellow victim, Spears, is a dead cock in the pit!

We little dreamed that a genius lay in wait for us who, by a sweep of his mighty pen, could wipe out statistics and brush away history like chaff, not stooping to notice even argument or reason!

Time has carried me well into the eighties, and though I have met with many foemen, this Lexden is the noblest Caesar of them all.

His mild and courteous manner proves him to belong to the true race of heroes, who, with all their power, are ever gentle and generous toward the vanquished.

H.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Bait and Buoys.

PERHAPS it was between the years 1850 and 1870 that the Adirondack Mountains began to come noticeably under the public eye, and among the first to visit and explore its wild secluded regions were the old-time sportsman and angler.

The noble buck, lusty trout, and magnificent scenery were tempting inducements to bring wielders of the rod and gun in the woods despite the fact of a long hard journey over carries and across lakes, together with rough drives of many miles in buckboards. Yet there was a certain fascination about the trip, and although eight hours on the train to-day carries us to the heart of the woods, one feels as though the old way had a touch of primeval wildness that the new one lacks.

It was at this time that the lakes suffered heavily at the hands of set-line fishermen. The sheet of water which especially concerns the following narrative was once almost entirely fished out, but by care and plentiful restocking has regained a good standard during the past ten or fifteen years. Landlocked salmon were planted within a recent date, but unfortunately when they reached maturity and were ready to spawn, every fish that could do so left the lake by the outlet never to return.

Rainbow trout (*Salmo irideus*) have since been put in, and still later another layout of salmon. Undoubtedly the former as well as the latter would have made their escape to running water except for the timely prevention of a rubblework dam and wire screen. However, in the future, both species will have to console themselves with the deep cold waters of the lake.

When the first whiff of balsam and other fragrant wood odors were wafted in the car window to our expectant nostrils on the way up, our thoughts turned to the blue lakes and amber streams awaiting us in the Adirondack wilderness, and after a safe arrival in camp the fishing tackle did not long lie idle. Although the light bamboo

fly-rods of the spring were by no means ignored, the brand new bait-rods and juicy earth worms seemed a trifle more acceptable to our taste, and evidently, from a later trial, were well suited to a trout's appetite.

"Suppose we go down the lake," said the Veteran one morning, shortly after our arrival, "and fish under the dam at the outlet. We might get a rainbow, as I have an idea some of them ran through the stone work before the screen was put in."

"All right," said I, "shall I tell Wallace to dig us a few worms?" "Yes," he answered, "go ahead, and I'll get some extra tackle to take along."

Everything ready, we started about ten o'clock and rowed down the lake.

The outlet from where it leaves the lake narrows to a stream of several yards in width and deep enough to paddle a boat through until the water suddenly plunges and foams over an old log dam.

Moss-covered rocks rise out of the stream in many places around which the boat must be carefully guided, while on each side rise steep banks and the thick green woods.

One tree with gray, gnarled, upturned roots stretches across the water, forming a natural arch under which the boat glides.

As we passed through this cool, watery pathway two silent slate-colored venison hawks flew from tree to tree along the shore, and from the woods came the bubbling, ecstatic song of a winter wren.

A few minutes later and we stood on the bit of sandy beach overlooking the dam, with the roar of the white surging cascade ringing musically in our ears. Soon a baited hook sank swiftly into the foaming depths, as the Veteran let down his line.

"There's a trout there, sure," he said, and at the same moment swung out a fat little *fortinalis* from the boiling pool.

"Now it's your turn to catch one," he said to me, "so drop in." The whirling water caught the bait and it disappeared from sight.

Almost instantly I felt a sharp nibble, and giving a jerk, up came another glistening trout.

We kept on taking turns dropping in alternately until we had some eight or ten brook trout strung on a birch twig.

"I guess we've caught them all," said the Veteran, after we had fished for some time without getting a bite. "Why don't you try over on the stone dam? Maybe you can catch a few baits, for when we came in I saw some swimming around there."

It didn't take me long to comply with his suggestion; so I picked up the pail and was soon settled comfortably out on the stones. Down in the clear depths I could see chub, suckers, and red fins moving in and out among the rocks, and when I dropped in a worm a bunch of fish swarmed around it, until one of their number was jerked suddenly and unceremoniously out of the water and into the waiting pail.

"Hey!" I heard the Veteran shout, "I've got a rainbow. Come over here." Some scrambling and hurry ensued on my part at his words, and after several narrow escapes from a ducking, I managed to reach him in time to see a bright shining fish lifted out of the pool and swung to a place of safety.

"He's a beauty!" I said, gazing down at the glittering iridescent sides of the rainbow. "What will he weigh?"

"About a pound and a half, I should think," answered the Veteran. "He isn't as fat as he might be, but his coloring is very handsome."

Probably this was the last fish that had run out of the lake, but nevertheless it gave us a comfortable feeling to think the screen had been put in at an early date.

Drawing near noon we stopped fishing and with a supply of trolling bait added to our string of trout, rowed for camp.

Another bright sunny morning with a rolling blue and white sky overhead, the Veteran and I went up the arm of the lake to our buoy. How many anglers scorn the thought of baiting a place and then fishing it, but when fish refuse a fly and you want to get a good big lake trout, the last named spot often gives you a chance of at least hooking a monster.

After a half a mile pull we reached the floating block which was fastened in the bow, and then out came the buoy lines.

"Here's a bait," said the Veteran, throwing me a piece of fresh cut chub. "Look out for yourself, or I'll have the first fish," he continued.

"Well, here goes," I said, casting over and letting out line until the sinker struck bottom.

Up and down moved our wrists to give the proper jigging motion to the bait, when suddenly the Veteran gave a jerk and commenced pulling in rapidly hand over hand.

"I've got him on," he said, in answer to my inquiry, "but he may get off yet." However, the fish did not have much time to think about breaking away, for with a splash! zip! flop! the Veteran brought him sailing into the boat, a bouncing two-pound speckled trout.

"Come, come!" said the Veteran to me, "why don't you catch something? Guess you're a Jonah."

"You wait a minute," I answered, "and you'll see me haul in one. Anyway, you've got a fish 'aura' and I haven't." With this I dropped in a freshly baited hook, and as it struck the soft, muddy bottom a sharp tug shook the line and I gave a "yank" in reply.

"He's on," I said, pulling in line as fast as I could. Nearing the surface the fish made several downward rushes that proved he had weight to back his fighting vigor, and just as I was about to lift him in there was a swirl accompanied by another boring surge toward bottom; but this was his last effort, and the next minute he lay in the basket, glistening in resplendent colors against the green ferns.

"Whew! what a bite," came from the Veteran's end of the boat, together with a powerful jerk that sent my heart into my mouth. "I've hooked him, and he's an old settler and no mistake," he added. "Be ready to net him when I tell you."

I could see the strain on his line was heavy, and as I gripped the net tightly I felt not a little tremulous and apprehensive as to my landing ability, for I had never netted a fish of more than two pounds. Leaning over the boat's side I could faintly discern a phantom-like

form coming upward that each moment seemed to grow larger and larger. Slowly but surely the Veteran drew him toward the surface, when, with a heavy plunging rush, he took out line and disappeared under the boat. A second time he was pulled gently up until he lay apparently exhausted on his side.

"Now net him," said the Veteran, and with shaking hands I bent over and slipped it under the shining, motionless body. For a second the big lake trout lay rigid across the hoop of the net instead of falling into its meshes. In that second I managed some way to lift him up. Just as I did so and had him over the boat, he gave a flop, the hook came out of his jaw, and turning he shot head first down through the rotten net meshes and into the bottom of the boat.

The Veteran made a dexterous grab, and seizing him under the gills, ended the fish's gyrations by a blow on the head. It was then, I think, that we gave vent to our exultation by shouts of triumph. For after we reached camp they told us our wild yelling had been distinctly heard.

"That is what might be called luck," said the Veteran, surveying the catch.

"If I had not netted him with such bad management he would have gone sure," I added.

"At any rate we've got him safe," he answered, "and now we'll go home and weigh him."

About twenty minutes later when we had our *Cristivomer namaycush* hung on the scales, he pulled them down to a plumb eight pounds, and the pair of speckled trout weighed two pounds each.

As a concluding remark I have but one thing to say, and that is that a little luck added to your fishing outfit will never be amiss.

CAMILLA.

The Maine Season.

BANGOR, Me., August 15.—*Editor Forest and Stream:* Maine trout are still rising to the fly, and in many of the inland and more highly elevated waters in good numbers, but there is a comparative lull in the sport in the State in general. Those who get to the lakes at the right time, however, are finding the fish ready to take a red ibis with a good deal of snap, although one visitor to an inland lake told the writer this week that he much preferred perch at this time to the trout, and as certain of the Maine lakes are stocked with this excellent pan fish, he is having his desire gratified as many times a day as he cares for them.

The season at the Bangor salmon pool has been one of surprises, and although there still remain a week or two in which it will be lawful to take these fish on a fly in Maine waters, the chances are against many more being landed at this pool. From the first of the season the fishing has been very poor, in fact has resulted in a total of scarcely more than a third of last year's catch, when 120 fish were brought to the gaff. In consequence of last season's sport, which was the best enjoyed here for many years, anglers had looked somewhat hopefully—yet fearfully—toward this year, fearfully because of the very erratic character of the pool, which has ever been a place of surprises; the majority of anglers not experts being greatly surprised when they hooked a fish, or as much surprised when weeks of vain fishing didn't bring them a rise.

The principal surprise of this season has been the catching of salmon late in the season, for until this year no salmon have been taken, if indeed fished for, after the middle of July, when the down river weirs are taken up and the salmon have, for the first time in the season, free access to the river. It has been urged that as salmon can be taken in Canadian rivers until the latter part of the summer, so the Penobscot ought to be able to do as well, but the average angler has not been venturesome enough to face criticism by trying the pool in late July and August. This year, however, several have kept at the sport right along, and to the surprise of most people July and August have maintained a very fair average in the number of salmon taking the fly, although they have been far more difficult to hook and slower to rise to the fly than earlier in the season. J. H. Peavey, whose expertness in salmon fishery at the pool is well known, has taken eight fish since the fifteenth of July, the date at which the fishing usually ends. Three of these were taken in one day, and the last was a bouncer, weighing twenty pounds, which Mr. Peavey hooked and landed all alone on the 11th inst., striking his fish when he had been on the pool scarcely five minutes. This is believed to be the latest date that a fish was ever landed at the Bangor salmon pool since fly-fishing began there. That the salmon are willing to rise to the fly when they get even further up the river has been proven time and again in spite of the contention of several old fishermen to the contrary, and recently a Bangor sportsman camping at Millinockett Lake hooked a big fellow that would weigh, he thought, fully eighteen pounds, in the Millinockett stream, a short distance below the lake. Having only a light rod and no net or gaff he was obliged to try a long fight, and, as the fish neared a big boulder in midstream it broke, passed completely over the rock and shook the hook from its mouth. The same angler brought into camp a few days ago two sea salmon of small size, probably a pound or two in weight, caught in the same stream while casting for trout.

The queerest looking salmon ever landed at the Bangor pool was among those taken by Mr. Peavey this month, but unfortunately he did not recognize the scientific value of his prize and took it home to cut up for the table, although he did save the head intact, and is having it mounted by a taxidermist so as to preserve its peculiarities. The upper jaw was entirely missing, the snout being turned in under itself, so that the lower jaw projected some little way beyond the upper, giving the head a most singular appearance. The cause of the deformity, and how the fish could manage to attain a weight of ten pounds, is considerable of a wonder to local fishermen, and various theories have been advanced as to the cause. The writer understands, however, that it did not affect the flavor of the fish, which proved excellent eating.

Ex-President Grover Cleveland, whose coming to Maine has been heralded every year for many seasons, is at last actually in this State to try the bass fishing, the guest of Joe Jefferson at the latter's camp on Moss Island in Meddybemps Lake in eastern Washington county. This

lake is a fine bass lake, and has for years furnished the residents of Calais and vicinity an abundant supply of the gamest and largest bass to be found in that part of the State, if, indeed, it can be surpassed within Maine's borders. Almost immediately after he reached the lake, Mr. Cleveland got out his tackle and made a cast from the landing, a four-pound bass rising to it and furnishing a good bit of sport. It was an auspicious beginning, and showed the veteran angler what he might have been enjoying long ago if he had but listened to the true stories of Maine fishing which do not need any amplifying to give them zest. The truth about Maine trout, Maine salmon, Maine togue, and Maine bass is big enough as it is.

Visitors to those lakes and ponds where white perch abound, report that the big fellows are coming to the surface these August days, and if one is quick and watchful he can secure some splendid pan fish and have a taste of lively if short sport by casting for them with the fly. They will take almost anything in the way of a fly if they'll take it at all, and perch weighing a pound and a half to two pounds and even larger are not unusual when caught in this way. For some reason it seems to be only the very large perch, usually caught only on the troll, that rise to the fly, consequently the fly-caster is right in the swim when he comes across a school of perch waiting for his first cast.

HERBERT W. ROWE.

Massachusetts Fish and Game.

BOSTON, August 15.—*Editor Forest and Stream:* The new boat which the Massachusetts Commissioners have had built for enforcing the game laws was launched at East Boston a few days since, and named the *Scoter*.

It is a naphtha launch 30 feet long and is capable of making 12 knots an hour. Warden Otis Thayer, of Quincey, is in command, and he will make her a terror to catchers of short lobsters and violators of the laws against wildfowl shooting on water.

As a result of a competitive examination to test the fitness of candidates for the office of paid deputy, Mr. H. A. Bent, of Franklin, was appointed a few days ago, and while in the discharge of his duties in enforcing the lobster law in the market of F. E. Sherman, of Fall River, on Tuesday, he was set upon by several men and driven from the place. He, however, succeeded in taking with him several shorts and caused the proprietor to be brought into court.

In company with Warden G. C. Paradis he has caused the arrest of six men for illegal fishing in Watuppa Pond. Several complaints have come to the writer during the past year of violations on that lake, and it is to be hoped "the game is up" with the vandals who have been guilty of breaking the law.

Mr. Herbert E. Tuck, of Haverhill, one of the tireless workers of the Central Committee representing the Haverhill Gun Club, writes that from reports which have come to him from many sportsmen in his section there are indications of good fall shooting of both quail and partridge. Similar reports are coming in from some other sections of the State.

Cleveland and Jefferson.

The ex-President and the actor have been having sport at Lake Meddybemps, Maine. The former is reported to have landed a 6-pound salmon, the largest ever taken from the lake at one fishing. They also took the finest string of bass ever taken from the lake at one fishing.

Mr. Charles B. Jefferson, son of the actor, has a camp on this lake, which, by the way, furnishes good sport in the proper season for bird shooting. Both ex-President Cleveland and Mr. Jefferson are expected to be present at the annual dinner of the Old Colony Club to occur on August 28.

A large number of sportsmen from the cities of New York, Philadelphia, and Boston are taking a vacation with its pleasant accompaniment of angling on the great lakes of the Rangeleys and Moosehead, and fly-fishing has been improving of late.

The writer has found the last half of August to be a good time for woods life. The black flies are gone, and as for mosquitoes, one must go provided with an antidote for them at all times till the frosts come. Inquiries are being made as to where and how to obtain the hunting licenses in Maine and New Hampshire. To all such my reply has been write to Hon. L. T. Carleton, Augusta, Me., or Hon. N. Wentworth, Hudson Centre, N. H., they being chairmen of the commissioners of their respective States.

CENTRAL.

Pleasant Hours at Tracadie.

THE northern coast of Prince Edward Island, which borders upon the Gulf of St. Lawrence, is justly celebrated for its fisheries.

While it must be extremely cold and bleak in winter, yet in summer the residents of the capital, Charlottetown, and of other southern and inland towns flock to the north for the sailing, bathing, and fishing, and the hotels are filled for their brief season.

Near one of these hotels, beside an almost landlocked harbor, I had the good fortune to be located the past month.

I said good fortune advisedly, as by great good luck I got domiciled in the home of a hospitable well-to-do farmer, who was also personally interested in the deep sea fisheries, and in consequence I saw far more of the native life than had I put up at a hostelry.

The people of this particular hamlet were descendants of the Scotch Highlanders, their ancestors having been loyal followers of "Prince Charlie," and they themselves remain good, honest, faithful Catholics to this day. Proceeding along the coast one also comes upon settlements of French, for this whole region was formerly a part of the celebrated Acadia. Sailing necessarily took up much of the time, as we went from ten to twenty-five miles each trip, sometimes getting becalmed, and often prevented from venturing out at all; consequently it was only upon six days that I had any deep-sea fishing, and then mostly in the intervals when my host and his mate were attending their nets and securing the mackerel, so beautifully iridescent when first caught.

To silence a "Doubting Thomas" who had spent the evening with me prior to my departure from New York,

I kept a record of each day's catch, and also of the actual time spent in fishing. In the dozen hours my line was out, I had the good luck to secure 102 cod, 8 haddock, and 1 hake.

These ran from two to twenty pounds, and afforded good sport, for although I necessarily used a hand line for the average depth of twenty fathoms, still it was of braided linen and as light as could be utilized without cutting the fingers, while the hook was a Sproat, about two-thirds the size of a regular cod hook, and the sinker just one-quarter the weight ordinarily used. The cod run larger in the autumn, and I saw some of forty pounds caught in trawling at this season, though I think these larger fish run mainly at night.

It is needless to add that the pleasure and health of the sport were greatly enhanced by the delightful sails under the guidance of so good a skipper as Capt. McDonald, and the appetite made short work of the bountiful luncheons prepared by his excellent wife.

Such times as it was expedient to venture out upon the Gulf, I fished in the harbor for flounders and blue perch (*Tautoglabrus adspersus*), the latter averaging three-quarters of a pound, the largest a pound and a quarter, and one morning I succeeded in catching over a hundred of these very fair pan-fish.

Four days I spent on fresh water at Campbell's Pond, a picturesque sheet where the privilege of fishing could be obtained from its genial owner for a small stipend. In this small landlocked pond I basketed forty-eight white perch (*Morone americana*) and thirty-five speckled trout.

These white perch proved excellent fighters on a light rod and the trout resembled their kindred everywhere, a joy to catch and to behold. The latter were lighter colored than the ordinary run of lake trout, as they could visit the sea at intervals, and, like other anadromous parrs, were silvery as well as golden.

The largest I caught weighed exactly two pounds, but the smaller ones proved by far the better pan-fish, the larger ones being chippy and dry. The nine days I spent in fishing will always afford me pleasant recollections of the "Garden of the Gulf," as the island is often called.

W. H. R.

NEW YORK, August, 1903.

Nebraska Waters.

FRANK PARMELEE—the old Omaha champion wing shot—writes that the tarpon fishing in the Gulf this season is better than it has been for years. "It is the greatest sport in the world," goes on Frank. "The tarpon is as game a big sea fish as lives, and right here they range from five to seven and one-half feet in length, and it is easy to imagine the excitement they can kick up when they once get on. I am sending Walter Kinnear, of the Omaha Gun Company, a mounted six-footer, the second one I ever caught."

A Missouri Valley correspondent writes me to know whether fish sleep, and perhaps the FOREST AND STREAM may feel inclined to answer the question. As for myself, I will boldly say that during my long experience as a rover of the woods and waters I have spent much time in studying the character and habits of our dumb creatures, and I have often caught asleep many species of fish. It is no uncommon thing to catch black bass asleep, as any of our old local anglers will verify.

State Game Warden George L. Carter and his deputies are having hot old times with the illegal prairie chicken shooters, and hardly a day passes but what they make an arrest or two. The difficulty so far is in securing convictions, but Warden Carter has done fairly well in this line, and is determined to keep the good work up until a healthy respect for the law is established throughout the State. The warden says, owing to the multiplicity of new bills presented to the Legislature last winter, that the impression got abroad that one of these had become a law changing the date of opening the chicken season from October 1 to September 1. But there was no change made in the game laws whatever, and the open season begins as heretofore on October 1. A big effort was made, however, and urged by the warden and his subordinates, to bring about this very change, but, happily, through my own persistent endeavor, this was prevented. October 1 is plenty early enough to begin shooting chicken in this State. By that time they are in simply perfect condition for the table, and are strong of wing, and in a measure able to cope with the all-devastating gunner.

Superintendent O'Brien of the State hatcheries, is now upon a trip along the Missouri River catching the young fish in the overflowed and backwater districts. He has saved many thousand sand pike of this year's hatch, besides a vast number of croppies and a good many black bass, all of which have been transported and deposited in likely waters throughout the State. While down in Cass county the superintendent caught a fifty-five pound white catfish in the Missouri, which is the largest specimen of this variety ever caught in Nebraska, and it will be forwarded to the World's Fair at St. Louis for exhibition during the big show next summer.

W. W. Bingham writes me from Long Pine, this State, that the trout fishing—both rainbow and speckled—was never so good in Pine Creek as it is this summer. On Sunday afternoon, between the hours of 3 and 4, he caught 29 rainbows, the largest tipping the scales at 3¾ pounds. Mr. B. added: "I am a tyro with the casting rod, and am willing to stake my reputation for veracity that an expert could have more than tripled my catch in the same length of time. As it was, I would have landed a number more had I not been driven in by a terrific electrical storm."

Long Pine Creek is one of the prettiest, most picturesque and peculiar little streams in the world, dashing, as it does, like a wild horse through a rift in the earth that was probably made in prehistoric days by some awful seismic disturbance. The water is cold, sparkling, and of matchless quality, and roars and tumbles and leaps along down through this rocky rent in the earth between wild ragged walls out of which the fork pine and dwarf oaks and cottonwoods thrust their scrubby arms and give to the red and gray rocks a delightful tinge of emerald.

In all my travels from the Aroostook to the Columbia I have never encountered a wilder and more entrancing revelation of nature's wonders than in this self-same roaring little torrent tearing through the bowels of the earth like something demoniacal. Fifty yards from the edge of the escarpment looking down upon this thrilling conglomeration of water, rock and verdure, no one would suspect that there was any sort of a water way within one hundred miles. There is nothing to forewarn one of its existence. It cuts right through the level desert, with no upheavals of earth or line of surface vegetation to indicate its presence. A few steps and you are upon its very brink, there to halt, to gaze, and to wonder.

Strange as it is, it has only been of late that the outers and sportsmen out here have begun to realize the boon this wondrous little stream affords them; a surfeit of wild and rhythmic beauties in a scenic way, and as magnificent trout fishing as can be obtained in the distant mountains. Camping parties this summer are more frequent than ever before, and in the years to come it is bound to prove the resort de resistance of all this resourceful country. The most interesting points and stretches of Pine Creek are pleasingly accessible from either Long Pine or Bassett, where all necessary supplies and the best of living can be secured at reasonable rates. And the trout are not the one attraction here for the sportsman, for the adjacent country is one of the best prairie chicken grounds in the world, and fall and spring the near by sloughs and marshes swarm with wildfowl.

Black bass are again rising encouragingly at Lake Washington and other near by waters, and local anglers are again in clover. Just now the best bait for casting is the big green crawfish, although the grass frog is always tempting, and the shiner is never bad. Care should be taken, however, not to use too heavy a sinker when casting with a crawfish or minnow; the latter being the most easily attained here, is generally used. If hooked properly through the back and not weighted too heavily, the minnow will try to get out of the way the instant he sees a big bass bearing down upon him. An important characteristic of the bass is that he will head up or down the lake by the hour with all kinds of little fish swimming complacently around him and not show the slightest inclination to take a gulp at them, but the moment he sees a little fellow trying to get out of his reach he immediately recoils that he wants something to eat and he goes for his victim like a streak of lightning. That is the reason that a good many anglers who go fishing day after day with their live bait loaded down with too much sinker rarely get a strike and more rarely a fish. Of course, this rule about the minnow does not always work in the same way, for oftentimes old *Micropterus* is out for gore after having fasted for an unusual period, then he will go anywhere and to any ends to satisfy his wants, and will sink his teeth into anything within reach. Our bass out here, however, seldom get into that condition. The trouble is they get too much to eat.

George Giacommi, one of our wealthy young sportsmen, is encamped with a party of Eastern friends up on Hackberry Lake in Cherry county, near the famous ducking grounds of E. Stilwell. They are having great sport with the bass in Hackberry, and the best kind of sickle-billed curlew and upland plover. I am indebted to Mr. Giacommi for a half dozen young curlew, and when I say that they beat young chicken a block I am expressing it mildly. By the way, this sand hills lake country is one of the greatest breeding grounds for sickle-billed curlew there is in the country, and in any part of it throughout the month of August the shooting on the young birds is unsurpassed. This year the crop is proving a big one. The opposite, however, is the case with the uplands. Since the first day I was afield with the Barrister and we bagged seventeen, I have been out a number of times and found the birds exceedingly scarce. In this connection the following note from one of Nebraska's best known sportsmen will not come amiss:

"SHELBY, Neb., Aug. 8.—Sandy Griswold: Have delayed writing you, hoping I would be able to ask you up to enjoy a good old time plover shooting, but up to date the birds are almost absolutely minus. The ranchers north of here tell me that the extreme wet and backward weather has almost wholly destroyed the hatch.

"H. C. BEEBE."

Roundabout Shelby has always been a famous resort for the birds en route south for their August conditioning grounds. In the past one hundred a day to a single gun was nothing particularly worthy of mention.

A letter to the writer from General Manderson, ex-United States Senator from Nebraska, says that the pleasure of good trout fishing is known only to the initiated. The capture of the confiding bass, some think, is easy compared with the landing of a full grown and experienced trout. No member of the finny tribe makes a bolder or more vigorous fight for life than these game denizens of our mountain lakes and streams. In most of the trout streams of the country a trout weighing from a half to two pounds is the only experience, and men who whip the Eastern streams feel proud of a basket containing trout of from six to eight inches in length. Up in this, the Big Horn country, such insignificant members of the trout species are not taken from the water, but thrown back unharmed to grow to respectable dimensions. The fishing in all the streams of northwestern Wyoming that flow from the mountains to the plains below is of an extraordinary character, and up in the heart of the mountains are numerous lakes where trout of the largest dimensions are to be found. Years ago, through the exertions of the members of the Dome Lake Club very largely, these streams were stocked with several species of trout, the native trout being crossed with the rainbow and salmon trout. The result has been a very gamy fish running to a large size.

One of the most expert fishermen, and perhaps the champion fly-caster of the United States, is Heyward G. Leavitt. He caught a very large number of trout, ranging from 4 to 5¾ pounds in weight, in some of the small streams back of Sheridan. All of these trout resorts, I will say for the benefit of Omaha and anglers in general, are easy of access from the Billings line of the Burlington railroad. To fish in the streams running through the Crow reservation a permit must be obtained from the

Indian agent, but this is never refused to any reputable party. The Dome Lake Club is a private organization, with a membership of twenty-five, which owns a large body of land in the heart of the Big Horn Mountains at about 9,000 feet elevation. The grounds belonging to the club are private property, and only for the use and enjoyment of the members of the club and their guests, but there is a vast territory and many miles of stream open to the public where the keenest enjoyment of the disciples of Izaak Walton can be had. Come up.

Clark Hayes and Fred Conroy have just left for the Rainy River country on the Manitoba line on a three weeks' muscallonge hunt.

SANDY GRISWOLD.

CHICAGO AND THE WEST.

Wisconsin Fishing Country.

Mr. Austin Lynch, of Canton, Ohio, is referred to this office by his friend, the metal boat man, Mr. W. H. Mullins, of Salem, Ohio, for advice on a fishing trip in Wisconsin. Mr. Lynch asks more especially regarding the Plum Lake and Star Lake district in the lower muscallunge region of Wisconsin. In reply, I would say that Plum Lake and Star Lake are much like other waters of that country to-day, rather problematical in the matter of muscallunge. Plum Lake I should think better than Star Lake for muscallunge, as it is not fished quite so much in the winter time by residents. One might or might not get a good muscallunge there, but he would be pretty sure to get walleyed pike and bass in considerable numbers. The St. Germaine waters below Plum Lake are easily enough accessible, and here there is a big 'lunge taken once in a while, as well as bass and walleyed pike. Above Star Lake, the late terminal of the branch of the St. Paul Railway, there are several other lakes which afford as good chances for muscallunge as any of the waters of that district, not to mention an abundance of bass and pike. Therefore, on the whole, Mr. Lynch would seem to be pretty safe in making Plum Lake his headquarters.

He might do almost as well if he stopped at the town of Minocqua, from which the spur of the aforementioned road swings off. There are several lakes right at Minocqua, and southwest of there are Squirrel Lake, Squaw Lake, Stone Lake, and a lot of others. In any of these waters one can get walleyed pike and bass fishing.

As to the muscallunge, it is in the first place a question of season, and in the second place a question of weather. There is no doubt in my mind at least that muscallunge shed their teeth in the summer time, and that during that time the large ones do not rise freely to the spoon. I should think September or October safer, therefore, than July or August; and of course if one expects to take muscallunge he should take advantage of the rough and cloudy days rather than expect to strike his fish in bright and quiet weather. When Mr. Lynch goes through here, if I can be of any further assistance, it will be a great pleasure. I don't think he would be far wrong in making either Plum Lake or Minocqua his central point. Squirrel Lake and John Hebdens place are well spoken of by friends who have tried them.

Drowned by a Pickerel.

Recent mention was made of the death by drowning in the Mississippi River near La Crosse of a young man, William Renz, who was pulled overboard by a big catfish which he had hooked. Day before yesterday a similar accident occurred near this city. John Davidson was fishing in the Calumet River, near Hammond, Ind., in the same boat with his brother, Fred Davidson. The two were out on a camping trip near Clarke station. As they were fishing in the river John hooked some kind of a big fish which is thought to have been a pickerel, and either the strength of the fish or the excitement of the moment caused him to lose his balance. The boat was overturned and John Davidson sank never to rise, his brother Fred being rescued with great difficulty. These two incidents coming so close together and being so unusual in their nature, are of singular though melancholy interest.

Detachable Fly-Book.

Mr. Geo. D. Barron, of Rye, N. Y., writes: "In the issue of FOREST AND STREAM for July 18, I notice reference to a fly-book with detachable leaves mentioned as being made by Mr. McLeod. If the same is regularly manufactured for sale by this gentleman, will you kindly place this letter where it will bring me an illustrated description of the said book, with advice as to cost, etc."

Mr. John D. McLeod, of Milwaukee, is purely an amateur tackle maker, and, as I have often said, is the cleverest in this line I have ever known. One could not purchase one of these fly-books of him, I presume, for a thousand dollars, but he would no doubt be quite willing to give specifications to anyone inquiring in the proper manner. I have found this friend very resourceful and ingenious in angling expedients, and quite as good natured and obliging as he is resourceful.

The Jugs and the Frogs.

There met by chance in the FOREST AND STREAM office here yesterday two gentlemen, one from St. Louis, Mo., and one from Vicksburg, Miss., and naturally they fell to comparing fishing notes.

"We sometimes have a little fun down in our country," said the Vicksburg gentleman, Mr. Thomas Dickson, "in fishing for the alligator gars which infest the snaggy bayous and lagoons of that district. We use a live bait which we fasten to a jug as a float. You know down in our country we are not strenuous all the time, so we put out these jugs and sit in the boat and watch them. When a big gar gets hold of the bait he makes off at express speed, and the jug will sometimes throw up a white stream of foam as high as your head. There are a good many jugs and snags in those waters, and it not infrequently happens that the fish smashes his jug against some obstacle, and in that case he gets away. Not even a big gar can keep a jug under water very long. We just follow along after the jug and presently we are in at the finish of the chase."

The St. Louis gentleman, Judge H., nursed for a time. This sport of jugging for big fish," said he, "is

by no means peculiar to your locality, but is of general knowledge and practice. It is, as you may have heard, very frequently employed on the Missouri River, where "jugging for cats" is at times a popular form of amusement. I am reminded in this connection of the most celebrated jugging expedition which ever went up the Big Muddy. That was in 1864, at a time when I was still a young man in that country. A friend of mine by the name of McGee, later very famous and wealthy in Kansas City, had a party of Eastern capitalists whom he was very desirous of entertaining. Mr. McGee was in the real estate business, and hence you may see the reasons for his wishing to make a good impression. As grand opera didn't then exist on the banks of the Kaw, Mr. McGee planned a little jugging expedition for his Eastern guests. He chartered a steamboat and placed on its deck about a dozen skiffs, together with as many big jugs, which, when tightly corked, were to serve as the floats, after the time honored custom in this sort of angling.

"Mr. McGee had always found the best success with live frogs in this kind of fishing, the big river catfish seeming to take very kindly to the speckled beauties. He steamed up the river from Kansas City to a point below Leavenworth, and then, after carefully attaching a line to each jug, baited each hook with a live frog and cast the outfit overboard. Mr. McGee himself appeared happy, but whether he had his eye most on the jugs or the capitalists, I leave it for you to decide.

"Well, the procession went down the Missouri River at a pretty swift clip for some time, the steamboat following in the rear. They ran the whole stream as far as Kansas City, and not a jug was seen to tip or bob all the way down the stream—not a nibble, not catfish enough for one plate of chowder. Mr. McGee was as much puzzled as he was enraged. The men who took out the jugs at the end of the day's sport found the cause of it. Each jug had been baited with a live frog, and each frog had discovered that he had a safe and comfortable means of locomotion close at hand. He climbed out of the water on to the jug, and thus had a safe journey down stream. It is not recorded that Mr. McGee sold any town lots to those visitors from the East."

For the Henry Lake Country.

Mayor Carter H. Harrison, of this city, Mr. Graham H. Harris, president of the school board, Mr. Edward Elliott, city electrician, and Colonel W. H. Haskell, of the school board, leave to-morrow or Monday evening for a two or three weeks' trip trout fishing in the Snake River and tributaries, west of the Henry Lake district, below the Yellowstone Park. The gentlemen go in via Pocatello Junction to Moneida. Messrs. Harris, Elliott, and Haskell fished this same district last year and had fine success. The gentlemen will return early in September, and anticipate a very pleasant experience in the West.

Back From Wisconsin.

Messrs. George Duddleston and Hugh O'Neill, of the city hall, mentioned recently as starting for a fishing trip in Wisconsin, are back to-day, and report 107 muscallunge, bass, and walleyed pike. Their largest muscallunge weighed only 17 pounds, but they had other smaller ones in abundance to satisfy them. They went in at Minocqua.

Michigan Bass Country.

Mr. Fred Taylor, of this city, one of our old time sportsmen, and in the early days engaged in the sporting goods trade in this city, is back this week from a visit with his friend, Mr. Henry A. Sloan, who has a country place near Base Line Lake, near Gobleville, Mich., some twenty-one miles from South Haven. The latter town is reached handily by boat from Chicago, and Mr. Taylor thinks he has discovered a bass country very much worth keeping in mind by Chicago anglers. There are numbers of lakes in that vicinity, which lies some eighteen miles north of Paw Paw Lake. Among the waters found productive of good bass are Duck Lake, Muskrat Lake, Eagle Lake, Mud Lake, etc. Mr. Taylor says that he will soon be going over there again for his fall campaign with the bass. The latter have not been biting very well for the past two or three weeks, but in September or October will go on the feed. Mr. Taylor says there is good quail shooting near Gobleville, and some grouse also not very far away. He thinks that he and his friend, Mr. Sloan, are in quite a sporty little country, and one easily accessible from this city.

By the way, Mr. Taylor is a great trout fisherman, and in speaking with him of the Waushara county region of Wisconsin he told me that he used to shoot prairie chickens all over that country years ago, and at that time there was not a trout in any of those Waushara waters which now abound in them. He said that the chickens and sharp-tailed grouse would take to the tamarack swamps, and in such localities afforded keen cover shooting. I was able to tell him that some chicken shooting is still to be had in that very district, which now is much more thickly settled and which offers angling as well as shooting attractions.

The Lauderdale District.

A friend just back from the Lauderdale chain reports very good sport at bass fishing last week, and all the squirrels in the neighboring woods that one could ask. He passed a very pleasant week in camp in that region.

A Long Snake.

FOREST AND STREAM has immortalized the duck story of our friend Eddie Price, an old time shooter of this city, who once killed so many ducks that he "couldn't pile them all in one pile." That wasn't bad as a story, but there has come to light to-day the record of a Texas rattlesnake which must have been a good deal of a snake in its way. My informant says that it was as "long as a railroad track." This is indefinite but extensive.

The Largest 'Lunge.

The largest 'lunge yet reported remains that taken by John Haskell in Winona Lake, Minn., 35 pounds. This is the season record so far as known at date.

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

A View of Catalina Fishing.

THERE are a great many people in California, neither new nor young nor wealthy, who will never make sportsmen nor men. Much is forgiven to a raw country, and to a people not yet adjusted to their new environments; but if we are fit and entitled to do half the bragging of California that we like to do, public sentiment here must soon crystallize in lines which will make impossible certain things which now discredit our humanity, our common sense, and our courage. At that wonderful resort of Catalina Island, one of the most striking sea resorts in the world, and certainly without a rival in the United States, the massacre of fish is somewhat unworthy of Digger Indians—and, in fact, impossible to Diggers. It is only people who have been civilized beyond their brains that can do such things. Parties there go out and catch every fish they can. It is a mark of the undeveloped mind not to know when one has enough; and these people seem never to have enough. Day after day tons upon tons of fish, caught by half-baked anglers, are brought into Avalon to be shown off, to be photographed with their proud captors, and then hauled far out and dumped into the ocean, lest they breed pestilence along the shore. Now, it is not too much to say that there is no other country in the world where this would be possible. No savage tribe on earth, no dago community, no village of Spanish seaboard peasants, no Guinea negroes, no cannibals on the Amazon, ever do such things. People who can do this would do anything—if they had the nerve. It may look like a far comparison, but it is the same maggot that breeds mobs. A man who would catch 500 trout in a day because he could and let 400 of them be wasted, has no real morals. He may be an esteemed citizen—but it is only because he is afraid of the law or the disgrace made and provided against common criminals. He is neither brave, nor gentle, nor quite honest. Such a person should be constitutionally disfranchised from the use of the rod. He is not only an insult to decent sportsmen, he is a robber of his own grandchildren. The Pacific is large water; but it has its boundaries. There are a good many fish, but they have an end. Already the "fish-hog" all along the California coast has seriously decimated the fish. If public opinion allows him to keep both his porcine feet in the trough, the time will come, and very soon, when there will not be fish for those that need them.

It is time for the class of Americans who are up-building California to a marvel among all commonwealths, to rate these offenders as they deserve; and if there can be no law to punish a man who kills a hundred pounds of yellow-tail to dump into the ocean, there can be, at least, the visible contempt of decent people. Of all the good things that Roosevelt has said, nothing was manlier nor truer than his warning that "no section of the country must be used to be skinned for the benefit of the few in a little while;" and the people who grossly, ignorantly and cowardly skin the ocean of its food supply, and its true sport, are as much public enemies as those who destroy the forests upon which our watersheds (and so our life) depend, or vandals of any other sort.—Chas. F. Lummis in Out West.

Sir Walter Scott on Angling.

THOUGH we have wetted a line in our time, we are far from boasting of more than a very superficial knowledge of the art, and possess no part whatever of the scientific information which is necessary to constitute the philosophical angler. Yet we have read our Walton as well as others; and, like the honest keeper in the New Forest, when we endeavor to form an idea of paradise, we always suppose a trout stream going through it. The art itself is peculiarly seductive, requires much ingenuity, and yet is easily reconciled to a course of quiet reflections, as, step by step, we ascend a devious brook, opening new prospects as we advance, which remind us of a good unambitious man's journey through this world, wherein changing scenes glide past him with each its own interest, until evening falls, and life is ended. We have, indeed, often thought that angling alone offers to the man the degree of half-business, half-idleness, which the fair sex find in their needle work or knitting, which, employing the hands, leaves the mind at liberty, and occupying the attention so far as is necessary to remove the painful sense of a vacancy, yet yields room for contemplation, whether upon things heavenly or earthly, cheerful or melancholy.

We may inform our reader, supposing him more ignorant than ourselves, that not all the love of rural scenery which is inspired by Walton—not all the instructions in practice which may be collected from this work, the composition of that far more illustrious successor, who has condescended to be his imitator, will ever make an angler out of one who is not gifted with certain natural qualifications for that amusement. No degree of zealous study will supply the want of natural parts. To "fish by the book" would be as vain an attempt as Master Stephen's proposal to keep his hawk on that principle.

There must be a certain quickness of eye to judge where the fish lies—a precision and neatness of hand to cast the line lightly, and with such truth and address that the fly shall fall on the very square inch of the stream which you aimed at, and that with as little splash as if it were the descent of the natural insect; there is a certain delicacy of manipulation with which you must use the rod

and reel when (happy man!) you actually have hooked a heavy fish; all of which requisites must combine to insure success. There are the same personal qualities requisite in shooting, billiards, and other exercises of skill, in the use of the turning-lathe. If thou hast any of this species of alertness of hand and truth of eye in thee, go forth, gentle reader, and return with thy basket more or less heavy in proportion to thy perseverance. But if thou wantest this peculiar knack, we doubt if even the patience that is exercised in a punt above Chelsea Bridge would greatly mend thy day's work; though thy dinner depended upon it, thou mayest go on flogging the water from morning till midnight, entangling the hook now in a bush, now in a stem, now driving it through the nose of some brother of the angle, and now through thine own, but not a fin wilt thou basket, whether of bull trout or minnow; and thou must content thee with half the definition of the angler, and be the fool at the one end of the stick and string, without the gudgeon at the other.

Indeed, there always seemed to us something magical in this peculiar dexterity which no chance or advantages of circumstances ever came to balance. The inequality between individual anglers exists to a degree which simple men will not be able to comprehend from a perusal of "Salmonia."

We before hinted that we have had our lucky days, and the most propitious time, both as to the size and number of trouts, were the hours before and after sunset upon the very warmest days of July and August. The large trouts which have lain hid during the whole day are then abroad for the purpose of food, and take the fly eagerly. These moments,

"When the sun, retiring slowly,
Gives to dew the fresher'd air,"

are still alive in our recollection as green spots in the waste of existence. We recollect with what delight we entered knee-deep into the stream after the heat of a sultry day, the green boughs on the margin scarce waving a leaf to the balmy gale of the evening—the stream which glided past us almost alive with the object of our pursuit—the whole a mixture of animal enjoyment, gratified love of sport, with a species of mental repose which enhanced both. This delightful amusement was not to be obtained if, "like the poor cat in the adage," we spared wetting out feet; for the shallowness of the stream, as well as the branches of the trees, impeding our sport, if we could not reach the middle current with our cast. Neither see we much cause to feel regret or remorse when we add that any little chilliness which might arise from pursuing this fascinating sport too late in the evening was effectually removed by a glass of right Nantz, Schiedam, or Glenlivet, which remedy, if the glass be not too large or filled a second time, we can with a good conscience recommend as a sovereign specific upon occasions of wet feet.—From a "Review of Sir H. Davy's 'Salmonia'" in Blackwood's Magazine.

A Try for a Killer.

STATE REPRESENTATIVE "Tal" Dodge, who represents Block Island in the Senate, is a fisherman of no small account. His business is seining menhaden and making fertilizer, and he has seen all kinds of fishing in the years he has been engaged at seining; but last Saturday was the banner day for "Tal." Taking his fishing smacks, the Earl and Nettie, he went after a school of fish reported seven miles south of the wireless station near Point Judith. Before reaching that school he came across a school of weakfish, squeteague, or yellow-fins, as they are variously known, which were being gobbled up by some larger fish, presumably killer sharks, *Orca gladiator*. The killer sharks have not been seen on this coast for years, and many supposed the species extinct. "Tal" said to his mate, "Bill" Hooper, another sea dog, "We must have one of them." So, getting their shark tackle ready, they came alongside the school, and, picking out a good looking fish, "Bill" let the harpoon drive, which went straight to its aim. The shark was a large one for a killer, if such it was, and it no doubt was a killer, as they attack other smaller schools of fish just as these were doing. About the time the killer felt the spear, it started and ran out all the line which was fastened to the harpoon, and then pulled the boat several miles to southward, and probably would have been towing it yet if the line had not parted near the boat. As it was, the fish took nearly all the 1,000 feet of line away with it. Dodge says he never saw such a sight nor rode in a boat at the speed that shark carried him, but he has not given up hope of getting one of them "pesky devils," and will try again if he gets a chance at them.

A party composed of a railroad conductor and a Providence policeman paid a visit to Lake Moswansicut Sunday to fish for black bass. They got bass, too, twenty-four in all, with no record breakers, the largest being 3½ pounds, and none less than 1 pound. The bait which seemed to please the bass Sunday was salt water shrimp. This is the largest mess of bass caught in Moswansicut this season. The lake has more fish in it, I believe, than any other lake in Rhode Island, but it is very uncertain about getting a mess from it, as some days one will not get a bite there with any kind of bait.

The fishing at Roger Williams Park Lake will close August 31, so Assistant Superintendent Costello says.

Why Fishing Sometimes Fails.

THE recent announcement in English newspapers that the King's salmon fishing waters in the Dee, which recently furnished such excellent sport to the Earl of Denbigh and Desmond, one of His Majesty's Lords of the Bedchamber, are to be fished by the Prince and Princess of Wales during their autumn residence at Abergeldie Castle, calls to mind the reason which has been given for the poverty of the sport enjoyed by the Prince during his spring salmon fishing of these waters. I have it from one who is in a good position to know the facts of the case, that otters had taken up their abode close to the best pools, and had ruined the sport for the days that the royal party were on the river.

Many salmon fishermen can no doubt recall somewhat similar experiences. I have bitter memories of more than one blank day from circumstances of a like nature. On one of the most promising days of last month I was lucky

enough to draw one of the best pools of the finest salmon river of the North Shore, when the river was full of fish and the water in the very pink of condition. If ever a man felt justified in anticipating a splendid day's sport, I felt that I was the individual in question on that particular morning. Cast after cast, however, failed to raise any fish, and after a couple of hours of hard work the reason was made apparent. The head of an enormous seal raised itself out of the water not ten lengths of the canoe away from where I was fishing. The deadly enemy of the fish had probably spent a good part of the night in the well-stocked pool feeding upon salmon, or endeavoring to catch a meal, and in either case had so disturbed the pool and alarmed the fish that further casting there that day was absolutely useless.

Last year, on one of the South Shore rivers, I turned around the point of land which brought into view the pool which I was to fish, only to see a flock of sheldrakes disporting themselves upon the surface of the water. Needless to say there was no fishing to be had in that pool that morning. It is not always, however, that the presence of seals or otters or sheldrakes or other enemies of the fish is discovered by the angler or his guides. They often disappear before the arrival of the fisherman on the scene, leaving him unable to account for the apparently strange conduct of the fish in declining all his flies.

E. T. D. CHAMBERS.

Susquehanna Fishing.

SAYRE, Pa.—The frequent heavy rains have interfered with the bass fishing on the Susquehanna to the extent at least of limiting the catch to proportions below the normal for this season of the year. At Ulster, Rummerfield, and Wyalusing some exceptionally nice black bass have been taken, but the best opportunities are yet to come.

At a point on the river just above Ulster, and between Ulster and Athens, there is a lovely bit of water that has yielded some noble bass on several occasions this season.

Complaint is being made by the anglers of Athens and Sayre that the outlet of sewerage pipes from several industries at Athens into the Susquehanna River is causing injury to the bass fishing for a considerable distance below that historic village, and should this prove the fact, a remedy would seem to be immediately in order.

Between Owego and Sayre a good many so-called yellow bass, otherwise and more correctly known as pike, have been recently taken from Susquehanna waters.

The Kennel.

Some Knowing Dogs.

I.

Editor Forest and Stream:

I have been of the opinion for a good many years that some animals at least can communicate with each other. I am sure dogs and horses can, and I believe a dog can with a horse. I have handled enough of both and have studied them. I once had a Gordon setter, and kept him for seven years, until he died of old age; that dog understood every word I spoke, whether addressed to him or not, and by watching him I satisfied myself that he and my horse understood each other. I have watched them time and again as they stood holding their noses together talking, or whatever you may choose to call it.

I saw an affair only a few weeks ago that would go far to confirm my opinion that dogs can tell each other what they want.

A storekeeper here in town has a large collie watch dog; the dog is very gentle. I have often handled him, and one day lately, as I was going past his store, I found him lying in the middle of the sidewalk worrying a large scup bone. While I stood looking on another big dog of no particular breed came up, and, seeing the bone, made a grab for it. The collie piled on him and was about to eat him up when I separated them. The strange dog ran down the street and disappeared around the next corner. When I got to this corner I saw him and two more large dogs standing up on the side street with their heads held close together. That collie will have the whole three of you to whip, now, I said to myself, and waited to see what was going to happen.

The three dogs came down on the main street and headed right toward the collie's place, the whipped dog leading them, while I followed.

When they had got there the collie and his bone were gone; he had either taken it or had been sent with it up a narrow alley.

The dogs, after smelling here, ran to the mouth of this alley, and while two of them stopped just short of it the one which had been whipped ran up it. He ran down again with the collie, after him, and now all three dogs piled on the collie and would have killed him if his owner and I had not beaten them off.

If that dog did not tell the other two what he wanted, and ask their help, how did those dogs know anything about this affair? They had not seen the first fight.

SOLDIERS' HOME, Erie, Pa.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days,
AUGUST.

19. Moriches, ladies' regatta.
20-22. Duxbury, Y. R. A., open, Duxbury.

20. First America's cup race; balance of races to be sailed on alternate days, Sundays excepted, until result is determined.
22. South Boston, club, City Point.
22. Southern, Rawlins, Tranchina and Olivieri cups, New Orleans.
22. Corinthian, fifth championship, Marblehead.
22. Royal Canadian, club, Toronto.
22. Chicago, special, Lake Michigan.
24-25. Wellfleet, Y. R. A., open, Wellfleet.
26. Moriches, McAleenan cup race.
27-29. Columbia, Lipton competitive cup races, Chicago, Lake Michigan.
27-29. Cape Cod, Y. R. A., open, Provincetown.
29. Seawanhaka Corinthian, club, Oyster Bay.
29. South Boston, club, City Point.
29. Chicago, special, Lake Michigan.
29. Beverly, sixth Corinthian, Monument Beach.
29. Royal Canadian, club, Toronto.
29. Corinthian, sixth championship, Marblehead.
29. Savin Hill, club, Dorchester Bay.
29. Huguenot, Y. R. A. of L. I. Sound, annual.

SEPTEMBER.

1. Chicago, special, Lake Michigan.
4-5. Eastern, open, Marblehead.
5. Seawanhaka Corinthian, club, Oyster Bay.
5. New York C. C., Y. R. A. of Gravesend Bay.
5. Royal Canadian, cruising race, Toronto.
5. Southern, Fornaris cup, New Orleans.
5. Indian Harbor, Y. R. A. of L. I. Sound, fall regatta.
5. Eastern, special, open, Marblehead.
5. Chicago, special, Lake Michigan.
5. Columbia, cruise to Indian Harbor.
5. Hempstead Bay, open.
5. Penataquit Corinthian, special, Bay Shore.
5. Beverly, open, Mattapoisett.
7. Indian Harbor, club, Greenwich.
7. Beverly, open sweepstake, Monument Beach.
7. Atlantic, club, Sea Gate.
7. Moriches, annual, open.
7. Seawanhaka Corinthian, club, Oyster Bay.
7. Jamaica Bay Y. R. A.
7. Larchmont, fall regatta, Larchmont.
7. Lynn, Y. R. A., open, Nahant.
7. Williamsburg, cruise.
7. Norwalk, Y. R. A. of L. I. Sound, annual.
7. Sachem's Head, Y. R. A. of L. I. Sound, annual.
7. Penataquit Corinthian, open, Bay Shore.
9-11. Columbia, races for Webb cup, Chicago, Lake Michigan.
10-12. Seawanhaka Corinthian, Y. R. A. of L. I. Sound, specials and fall regatta.
12. Keystone, open, Woodmere, L. I.
12. Beverly, seventh Corinthian, Monument Beach.
12. Bay State, Y. R. A., open, Lynn Bay.
12. Chicago, handicap race to Kenosha.
12. Columbia, fall regatta, open, Chicago, Lake Michigan.
12. Royal Canadian, Prince of Wales cup race, Toronto.
19. Chicago, special, Lake Michigan.
19. Seawanhaka Corinthian, club, Oyster Bay.
19. Larchmont, schooner cup race, Larchmont.
19. Atlantic, fall regatta, Sea Gate.
19. Bensonhurst, Y. R. A. of Gravesend Bay.
19. Manhasset Bay, Y. R. A. of L. I. Sound, fall regatta.
26. Riverside, Y. R. A. of L. I. Sound, fall regatta.
26. Seawanhaka Corinthian, club, Oyster Bay.
26. Chicago, handicap, Lake Michigan.
27. Williamsburg, open, fall regatta.

OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.
3. Columbia, special, Lake Michigan.
5. Southern, fall, New Orleans.
10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.
Second prize, \$50.00.
Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

AFTER Irondequoit had lost two straight races to Strathcona, the crushing defeat Kolutoo met with at Montreal was again brought to mind, and yachtsmen throughout the country felt that the Canadian yachtsmen were invincible and that the Canada's Cup would not be brought back to the States this year.

The first two races were lost, not because Irondequoit was a slow boat, but because Strathcona was better handled. The defender, in the hands of Mr. Æmelius Jarvis, and a superior amateur crew, was sailed to perfection. The handling of the light sails on Irondequoit was the cause of no little criticism, and it was painfully evident that the bowsprit man was entirely incompetent or maliciously negligent of his duties. At the end of the third race he was ordered off the boat. The man is a Scotchman, and was said to have sailed on the first and second Shamrocks. His blunders lost the boat much time in both of the first two races.

After the second race Mr. William Gardner, the de-

THORELLA II.—SEAWANHAKA CUP DEFENDER—Photo by Wm. Notman & Son, Montreal.

signer of Irondequoit, felt that the boat could do better, and determined to get someone else to sail her. Mr. Gardner was unable to call on Mr. Frede M. Hoyt, one of our ablest amateur sailors, who went to Canada to sail on the challenger, as he was hurt by a fall on board during the first race and was unable to sail on the boat again. This made it necessary for Mr. Gardner to send to New York for Mr. Addison G. Hanan, one of the owners of the unbeaten Aspirant and a man of whose ability he was absolutely sure. Mr. Hanan responded promptly to Mr. Gardner's telegram, and arrived at Toronto just in time to board the boat before the preparatory signal for the third race was sounded. Mr. Hanan had never sailed on Irondequoit; in fact he had only been aboard the boat once before, and all practical yachtsmen know full well how difficult it is to sail to the best advantage a boat with which they have never been "shipmates." In Mr. Hanan's hands, however, Irondequoit was a different boat, and the story of how she took three straight races is told in detail elsewhere in these columns. In the fourth and fifth races Mr. H. Wilmer Hanan joined forces with his brother, and this made a combination that was hard to beat.

The races were all won on the starts, and in the last three Irondequoit had the best of it in each instance.

In light and moderate winds Irondequoit and Strathcona are pretty evenly matched. The challenger is very much faster in stays, which gave her some advantage in windward work, where short hitches were being made. In a breeze of wind, however, Irondequoit was much the smarter of the two on all points of sailing. Irondequoit was under-rigged, and after getting up to the Lakes 2,700 pounds of inside ballast was added to bring her down to the required area of immersed midship section. This additional weight made the boat more sluggish in light weather than she was when she sailed during the early part of the season on Long Island Sound.

All those who sailed on Irondequoit speak in the most glowing terms of the Canadian yachtsmen, particularly those who sailed on Strathcona. They proved themselves splendid sailors, thorough gentlemen and good losers—a most unusual thing in these days. In fact, one of the gentlemen who sailed on Irondequoit remarked to the writer that Strathcona's crew were as happy and jubilant over the outcome of the races as if they had won themselves. This is the kind of international racing that makes good sportsmen and promotes good fellowship, and it should be encouraged.

Mr. Gardner has lived up to his reputation in turning out so fine a boat as Irondequoit, but all credit should be given to Mr. Addison Hanan for the splendid way in which he handled her and for the able assistance rendered by his brother and the rest of those on board.

Newport Special Thirties.

NEWPORT, RHODE ISLAND,
Friday, Aug. 7.

The thirties sailed a sweepstake race on Friday, and Carolina won by 26s. The breeze was fresh from the

S., making it a run to the outer mark and a beat back. Barbara got the best of the start and led to the outer mark, but on the windward work was overtaken by both Carolina and Raccoon. The summary, start 3:20:

	Finish.	Elapsed.
Carolina, Pembroke Jones.....	4 43 16	1 23 16
Raccoon, J. R. Drexel.....	4 43 42	1 23 42
Barbara, W. Rutherford.....	4 43 45	1 23 45
Vaquero III., Payne Whitney.....	4 46 14	1 26 14

Saturday, Aug. 8.

The 30-footers sailed a race on Saturday for a cup offered by Vice-Com. Henry Walters, New York Y. C. The course was six miles to leeward and return. The breeze was fresh from the S. W. Raccoon got the start and led to the outer mark, but on the beat back to the finish she was passed by Barbara, which

boat won by 21s. The summary, start 3:22:

	Finish.	Elapsed.
Barbara, W. Rutherford.....	4 55 31	1 33 31
Raccoon, J. R. Drexel.....	4 55 52	1 33 52
Carolina, Pembroke Jones.....	4 56 34	1 34 34
Vaquero III., Payne Whitney.....	Withdrew.	

Monday, Aug. 10.

Another sweepstake race was sailed on Monday by four of the 30-footers, and Barbara won. The breeze was strong from the S. W. Raccoon was first over the starting line, but Barbara and Carolina soon passed her. After a pretty race Barbara finally worked by Carolina and won the race. The summary, start 3:23:

	Finish.	Elapsed.
Barbara, W. Rutherford.....	4 51 53	1 28 53
Vaquero III., Payne Whitney.....	4 53 11	1 30 11
Raccoon, J. R. Drexel.....	4 54 04	1 31 04
Carolina, Pembroke Jones.....	4 55 29	1 32 29

Friday, Aug. 14.

On Friday the thirties and the 15-footers raced. Vaquero III. won in her class, and Minnow beat the other three 15-footers. The 30-footers started in Brenton's Cove and sailed around Brenton's Reef Lightship and back. The 15-footers covered a triangular course in the upper bay. The breeze was fresh from the S. W. The summary:

30-footers—Start, 3:35.

	Finish.	Elapsed.
Vaquero III., Payne Whitney.....	4 56 23	1 21 23
Raccoon, J. R. Drexel.....	4 46 45	1 21 45
Barbara, W. Rutherford.....	4 56 55	1 21 55
Carolina, Pembroke Jones.....	4 59 08	1 24 08

15-footers—Start, 3:40.

	Finish.	Elapsed.
Minnow, W. Gammell, Jr.....	4 31 25	0 51 25
Eaglet, W. Grosvenor.....	4 33 00	0 53 00
Hawk, H. Lippitt.....	4 33 15	0 53 15
Yo San, Miss Morgan.....	4 36 28	0 53 28

Saturday, Aug. 15.

On Saturday the 30-footers raced from Brenton's Cove to and around Brenton's Reef Lightship again. The race was sailed in a hard S. W. breeze and was interesting from start to finish. Carolina led around the lightship by a few seconds, but she crossed the finish line nearly a minute ahead of Barbara. The summary, start 3:23:

	Finish.	Elapsed.
Carolina, Pembroke Jones.....	4 45 11	1 25 11
Barbara, W. Rutherford.....	4 46 09	1 26 09
Raccoon, J. R. Drexel.....	4 47 44	1 27 44
Vaquero III., Payne Whitney.....	4 48 09	1 28 09

Monday, Aug. 17.

The 30-footers and the 15-footers sailed a good race on Monday. The breeze was strong from the S. E. The 15-footers covered a triangular course in the bay, while the 30-footers sailed from Brenton's Cove to the Compass buoy and return. Barbara got the start and led all over the course, winning easily. Eaglet, sailed by Miss Caroline Grosvenor, won in her class. The summary:

30-footers—Start, 3:29.

	Finish.	Elapsed.
Barbara, W. Rutherford.....	4 43 49	1 14 49
Vaquero III., Payne Whitney.....	4 45 06	1 16 06
Carolina, Pembroke Jones.....	4 47 26	1 18 26
Raccoon, J. R. Drexel.....	4 50 14	1 21 14

15-footers—Start, 3:34.

	Finish.	Elapsed.
Eaglet, Miss Grosvenor.....	4 34 58	1 00 58
Hawk, W. Gammell, Jr.....	4 35 34	1 01 34
Minnow, H. Lippitt.....	4 35 37	1 01 37
Yo San, F. A. Plummer.....	Did not finish.	

Mr. Frank Bowne Jones has made the following charters through his agency: The steam yacht Idalia for Mr. Eugene Tompkins, to Mr. J. Ogden Armour; and the steam yacht Cangarda for Mr. Charles J. Canfield, to Mr. J. A. Spoor.

Atlantic Y. C. Race Week.

SEA GATE, L. I.

Wednesday, August 12.

Race week at the Atlantic Y. C. began on the afternoon of Wednesday, August 12. It was arranged in place of the annual cruise of the Sea Gate organization which was called off this year because of the difficulty of finding dates which would not conflict with other important yachting events.

Mr. Hendon Chubb, of the Atlantic Y. C., offered a cup to go to the winner of the series of the first three days racing in class P. The club offered similar series trophies in the other classes. The usual winners' prizes in each race were also given.

The competition on Wednesday was for classes J and under. Nineteen boats started, all but one of which finished. The winners were Bobtail, Vagabond, Trouble, Scalawag, and Rascal. Effort scored a sailover. Boats in classes M and above twice covered a triangular course of seven miles. The other starters went twice over the usual inside quadrangle course, a total distance of seven miles. A good breeze from the N. W. held throughout the contest, making excellent sport. The summary:

Sloops—Class L—Start, 3:10.			
	Finish.	Elapsed.	
Effort, F. M. Smith.....	5 59 25	2 49 25	
Sloops—Class M—Start, 3:15.			
Bobtail, E. F. Luckenbach.....	6 07 33	2 52 33	
Bagheera, Hendon Chubb.....	6 08 55	2 53 55	
Vivian II., S. E. Vernon.....	6 09 40	2 54 40	
Adeline, J. B. O'Donohue.....	6 31 20	3 16 20	
Sloops—Class P—Start, 3:20.			
Vagabond, T. A. Vernon.....	4 43 05	1 23 05	
Naiad, J. P. Palmer.....	4 45 05	1 25 05	
Smoke, L. J. Dyer.....	4 49 00	1 29 00	
Cockatoo, W. A. Barstow.....	4 51 20	1 31 20	
Kate (yaw), John T. Negus.....	4 53 40	1 33 40	
Sloops—Class Q—Start, 3:25.			
Trouble, W. H. Childs.....	4 51 40	1 26 40	
Careless, F. J. Havens.....	4 54 05	1 29 05	
Mary, M. Grundner.....	4 54 35	1 29 35	
Wraith, Calvin Tompkins.....	4 57 23	1 32 23	
Sloops—Class R—Start, 3:25.			
Sandpiper, W. W. Redfern.....	4 58 54	1 33 54	
Apukwa II., E. S. Tefft.....	5 05 12	1 40 12	
Scalawag, E. S. Ludlow.....	4 57 10	1 52 10	
Catboats—Class V—Start, 3:30.			
Rascal, D. G. Whitlock.....	5 00 20	1 30 20	
Millie, E. A. Bogert.....	Did not finish.		

Thursday, August 13.

On Thursday the sport included, besides races for the usual classes, events for power boats held under the racing and rating rules of the American Power Boat Association. Eighteen craft started in the struggle for sail boats, all but three of which finished. The winners were Effort, Bobtail, Vagabond, Trouble, Sandpiper, and Rascal. A good breeze blew from the W., which strengthened toward the end.

In order to make a race for Effort, Mira started on regular time allowance. She was handled by Mr. Edward McLellan. Charles T. Piece sailed Effort as on the first day. The same courses were covered as in the initial regatta. Coming home on the second round of the outer course, the 30-footer Bagheera was forced aground on Swinburn Island by the swell of a passing Sandy Hook steamer. The mishap robbed her of all chances of winning. She was later pulled off, apparently undamaged, by Mr. Edward Luckenbach's steam yacht Papoose. The summary:

Sloops—Class L—Start, 2:05.			
	Finish.	Elapsed.	
Effort, F. M. Smith.....	4 24 52	2 19 52	
Mira, P. W. Church.....	4 36 20	2 31 20	
Sloops—Class M—Start, 2:10.			
Bobtail, E. F. Luckenbach.....	5 00 43	2 50 43	
Vivian II., S. E. Vernon.....	5 06 03	2 56 03	
Bagheera, Hendon Chubb.....	Ran aground.		
Adeline, J. B. O'Donohue.....	Did not finish.		
Sloops—Class P—Start, 2:15.			
Vagabond, T. A. Vernon.....	3 33 12	1 18 12	
Naiad, J. B. Palmer.....	3 33 13	1 18 13	
Cockatoo, W. A. Barstow.....	3 33 45	1 18 45	
Smoke, L. H. Dyer.....	3 34 15	1 19 15	
Sloops—Class Q—Start, 2:20.			
Trouble, W. H. Childs.....	3 37 22	1 17 22	
Mary, M. Grundner.....	3 41 30	1 21 30	
Careless, F. J. Havens.....	3 43 25	1 23 25	
Sloops—Class R—Start, 2:20.			
Sandpiper, W. W. Redfern.....	3 43 42	1 23 42	
Scalawag, E. S. Ludlow.....	3 45 07	1 25 07	
Apukwa II., E. S. Tefft.....	3 49 16	1 29 16	
Catboats—Class V—Start, 2:25.			
Rascal, D. G. Whitlock.....	3 55 50	1 30 50	
Millie, E. A. Bogert.....	Did not finish.		

The power boats were sent away soon after the sailing craft. It was the fourth regatta to be held under the rules of the Association this year. Ten starters came to the line. The winners were Allure, Queen Bess, Express, and Corona. Standard got a sailover.

The best work of the day was done by Express, owned and designed by Mr. Charles D. Mower, measurer of the New York Y. C., which did the twelve-mile course in 1h. 8m. 27s., including the turns necessary in covering a four-mile triangular course three times, as classes I and above were called upon to do. The other starters went twice over the triangle. The summary:

Class A—Start, 2:35.			
	Finish.	Elapsed.	Corrected.
Allure, Alex. Stein.....	3 39 05	1 04 05	0 54 40
Jack, G. W. Boyce.....	3 45 50	1 10 50	1 03 32
Duffano, Peter Duffy.....	3 46 20	1 11 20	1 11 20
Class C—Start, 2:35.			
Queen Bess, R. H. Sterns.....	4 02 32	1 27 32	1 27 32
Chic, Whitney Lyons.....	Disabled.		
Class H—Special—Start, 2:40.			
Standard, E. A. Riotte.....	3 28 12	0 48 12	0 48 12
Class I—Start, 2:40.			
Express, C. D. Mower.....	3 48 27	1 08 27	1 08 27
Reamer, J. M. Fiske.....	4 07 18	1 27 18	1 14 48
Class K—Start, 2:45.			
Corona, A. H. Luke.....	4 14 00	1 29 00	1 29 00
Kotick, C. H. Paine.....	Disabled.		

Friday, August 14.

Thirteen boats started in the event on Friday. All finished. The winners were Mira and Vagabond (on time allowance), Bobtail, Trouble, and Sandpiper. It was the last race of three for the series prizes in each class. Victories of the week gave Vagabond the cup offered by Mr. Hendon Chubb for the winner of the series in class P. Other series prizes given by the Atlantic Y. C. went to Effort, Bobtail, Trouble, and Sandpiper.

Effort and Mira, now chartered to Mr. Theodore H.

Church, raced on double the usual time allowance by the old rule. Mr. F. M. Smith sailed Effort and Mr. Edward McLellan handled Mira. Effort finished 2m. 32s. ahead of Mira, not a large enough margin to win out.

The breeze hovered between W. and S., and was never stronger than seven knots. The usual courses were sailed. In the whole series boats received time allowance according to the A. Y. C. rule, regardless of the date of their launching. Corrected times, however, were figured out only when victory was in doubt. The summary:

Sloops—Class L—Start, 2:10.			
	Finish.	Elapsed.	
Effort, F. M. Smith.....	5 49 11	3 39 11	
Mira, T. H. Church.....	5 51 43	3 41 43	
Sloops—Class M—Start, 2:15.			
Bobtail, E. F. Luckenbach.....	6 00 41	3 45 41	
Bagheera, Hendon Chubb.....	6 07 06	3 52 06	
Vivian II., S. E. Vernon.....	6 14 04	3 59 04	
Sloops—Class P—Start, 2:20.			
Naiad, J. B. Palmer.....	4 10 49	1 50 49	
Vagabond, T. A. Vernon.....	4 11 37	1 51 37	
Cockatoo, W. A. Barstow.....	4 16 38	1 56 38	
Sloops—Class Q—Start, 2:25.			
Trouble, W. H. Childs.....	4 26 22	2 01 22	
Careless, F. J. Havens.....	4 35 55	2 10 55	
Sloops—Class R—Start, 2:25.			
Sandpiper, W. W. Redfern.....	4 35 38	2 10 38	
Scalawag, E. S. Ludlow.....	4 40 25	2 15 25	
Apukwa II., E. S. Tefft.....	4 42 38	2 17 38	

Saturday, August 15.

A race for yachswomen of unusual success occurred on Saturday. Sixteen craft covered the inside course of 3½ miles once, all starting together in one class on time allowance.

To the winning helmswomen Commodore Robert E. Tod offered a silver platter. Other prizes were given by the Atlantic Y. C. T. A. Vernon's raceabout, Vagabond, sailed by the owner's wife, took first prize. W. H. Childs' Trouble, sailed by Miss M. Childs, was second, and W. A. Barstow's Cockatoo, handled by Mrs. Barstow, took third. A good S. W. breeze held throughout. The summary:

	Start.	Finish.	Elapsed.	Corrected.
Vagabond.....	2 05 30	2 50 12	0 44 42	0 39 54
Trouble.....	2 15 00	3 00 48	0 45 48	0 40 07
Cockatoo.....	2 05 30	2 51 10	0 45 40	0 41 33
Bobtail.....	2 07 30	2 49 42	0 42 12	0 41 36
Vivian II.....	2 05 30	2 47 45	0 42 15	0 42 15
Bagheera.....	2 05 30	2 48 46	0 43 16	0 42 45
Adeline.....	2 07 30	2 51 25	0 43 55	0 42 51

Kate (yaw).....	2 05 30	2 55 50	0 50 20	0 44 16
Mary.....	2 05 30	2 56 23	0 50 53	0 44 51
Wraith.....	2 05 30	2 56 22	0 50 52	0 45 11
Peccina.....	2 05 30	2 59 00	0 53 30	0 45 44
Constance.....	2 05 30	2 59 30	0 54 00	0 46 14
Corona.....	2 08 20	2 57 20	0 49 00	0 46 38
Apukwa II.....	2 05 30	3 00 23	0 54 53	0 47 07
Smoke.....	2 05 30	2 58 00	0 52 30	0 48 43

Water sports, power launch and dinghy races were held in the afternoon. Throughout the week visiting yachtsmen were furnished with plenty of entertainment, including open air vaudeville, fireworks, music, and dancing. The summary of the closing sports on Saturday afternoon follows:

Launch race—Three and a half miles. Won by Varuna, F. F. Ames; Corona, Arthur F. Luke, and Taniwha covered wrong course.

Single Dinghies—Quarter of a mile. Won by Edward Albertson, Corona; Charles Holme, Mira, second; Loyal, third. Alexander Olsen, Vivian II., also started.

Double Gigs—Quarter of a mile. Atlantic Y. C. boat won; Loyal, second; Corona, third. Thistle also started.

Swimming Race—Fifty yards, novice. Won by Hudson Booth; H. S. R. Anderson, second; Walter S. Sinclair, third. Henry Eagle also started.

Potato Race—Won by John Lake, Thistle; Lewis Nelson, Ondawa, second; Charles Holme, Mira, third. Albert Young and John Matthews, Taniwha, also started.

Tub Race for Members' Sons—Won by Henry Eagle; Hudson Booth, second. There were five other starters.

Special Swimming Race—Won by Albert Hyde, Thistle; Hudson Booth, second; John Lake, Thistle, third.

Walking Greased Pole—Won by Albert Hyde, Thistle.

Sewell Cup Race.

BARNEGAT BAY, N. J.,

Saturday, Aug. 8.

The annual race for the Sewell Cup was sailed on Barnegat Bay on Saturday, Aug. 8.

The cup was offered originally by the late United States Senator Sewell, of New Jersey, for perpetual competition by the clubs along the bay. The first race for the cup was sailed in 1900, when the trophy was won by the Island Heights Y. C. cat Bouquet. In 1901 it was captured by the Mina, also an Island Heights Y. C. cat. In 1902 it was retaken by the Bouquet, which in the time being had been purchased by a member of the Seaside Park Y. C.

In 1902 Messrs. Walter and O. K. Stevenson, of Philadelphia, members of the Seaside Park Y. C., had the catboat Empress built from designs by Mr. C. D. Mower. She measures 30ft. 6in. over all, her length on the waterline is only 15ft. 3in.

Empress did not show up very well in the races last year, so Mr. Mower, the boat's designer, went on to sail the boat himself.

The boats were to cover an eleven-mile course twice. The wind was fresh from the S. E., making it a broad reach to the outer mark and a close reach back to the finish line.

Empress crossed the starting line just after the gun and led the boats all over the course, finishing an easy winner. The summary:

	Start.	Finish.	Elapsed.	Corrected.
Empress.....	2 16 15	3 46 52	1 30 37	1 23 05
Mina.....	2 16 40	3 50 26	1 33 46	1 29 19

Horseshoe Harbor Y. C.

LARCHMONT, LONG ISLAND SOUND,

Saturday, Aug. 15.

The fourteenth annual regatta of the Horseshoe Harbor Y. C. was sailed on Saturday, Aug. 15. The event was marked by a good list of entries, sixty boats starting and all but six finished.

The boats started in a light S. breeze, but later it shifted to the S. W. and freshened. Most all the boats covered a nine-mile triangular course. Several boats were disqualified—some for sailing a wrong course and others for going inside the buoys on Hen and Chickens.

The Regatta Committee, made up of Messrs. E. C. Griffin, Butler Whiting and Willard Fisher, were on board Mr. Mayhew Bronson's auxiliary yawl Trochilus.

Snapper and Spinster were protested by Mr. E. A. Stevens, owner of Chingachcook for not complying with the scantling restrictions of the Yacht Racing Association of Long Island Sound.

Alert and Mimosa, the only starters in the 30ft. class, were sent away at 11:35. Mimosa sailed a good race and beat Alert, the champion of the class, by 4m. 4s.

In the 25ft. sloop class, there were six starters. Priestess was disqualified and Naiad did not finish. Snapper was the first boat to finish and spinster was second. Until the protest on scantling in this class is settled, the winners cannot be given out.

Jeeri withdrew in the 21ft. sloop class, and Montauk beat Gazabo about 40m. Cricket did not finish in the 18ft. sloop class, so the race goes to Pandora, the only other starter. Jag gets the race in the 21ft. catboat class, Arline and Dorothy were disqualified. Lobster took a walkover in the 18ft. catboat class. Sneaker won in the 15ft. catboat class, as Champion did not finish.

In the New York Y. C. one-design class, Hope gave Lively a bad beating.

There were nine starters in the raceabout class. Maryola won and Jolly Tar was second.

Houri won in the Larchmont Y. C. one-design class. The summary follows:

Sloops—30ft. Class—Start, 11:35.		
	Finish.	Elapsed.
Alert, J. W. Alker.....	2 06 40	2 31 40

Corinthian Y. C.

MARBLEHEAD, MASS.,
Wednesday, Aug. 5.

The midsummer series of invitation races of the Corinthian Y. C. was opened on Wednesday, Aug. 5, with a screeching northeaster, in which all the yachts were well reefed down. In the 25-footers Sally VII. got away first and led all over the course. In the 18-footers Arrow got the start, but on the first round Aspinquid II. took the lead. Miladi II. caught and passed her on the second round, holding her lead to the finish. In the handicap class Setsu won easily. The summary:

Class A—25-footers.		
Sally VII., L. F. Percival	Elapsed.	
Great Haste, T. K. Lothrop, Jr.	1 06 30	
Chewink III., F. G. Macomber, Jr.	1 11 32	
Seboomook, B. A. Smith	1 13 18	
	1 16 10	
Class B—22-footers.		
Tayac, W. H. Joyce	1 27 37	
Class C—Raceabouts.		
Baggarah, R. C. Robbins	Withdrew.	
Class F—18-footers.		
Miladi II., F. R. Adams	0 45 42	
Aspinquid II., C. M. Foster	0 45 48	
Chance, Reginald Boardman	0 46 36	
Arrow, E. A. Boardman	0 47 24	
Class D—Handicap.		
Setsu, Talbot & Lewis	Elapsed.	Corrected.
Gringo, W. H. Brown	1 20 40	1 20 40
Ruth, H. S. Wheelock	1 24 10	1 21 45
	1 28 00	1 22 21

Thursday, Aug. 6.

For the second race of the midsummer series there was a light easterly breeze. In the 25-footers Great Haste was first over the starting line, but Sally VII. soon pulled out ahead of her and led to the finish. In the 22-footers Opitsah V. got the start and led all over the course, except once, on the windward leg, when Tayac forced her. Opitsah V. got her advantage back again, however, and was never headed again. In the 18-footers Arrow got the start, but Chance went out ahead of her on the first leg. On the reach and run Arrow again got first place and held it. Gringo won on corrected time in the first handicap class, and Ruth won in the same manner in the second handicap class. The summary:

Class A—25-footers.		
Sally VII., L. F. Percival	Elapsed.	
Great Haste, T. K. Lothrop, Jr.	1 35 55	
Seboomook, B. A. Smith	1 36 10	
	1 38 05	
Class B—22-footers.		
Opitsah V., S. H. & H. J. Foster	1 36 58	
Tayac, W. H. Joyce	1 37 32	
Medric, H. H. White	1 38 22	
Chief, S. C. Winsor	1 42 06	
Class C—Raceabouts.		
Baggarah, R. C. Robbins	1 40 40	
Runaway Girl, C. H. Tweed	1 44 39	
Idol, C. E. Gibson	1 50 22	
Class F—18-footers.		
Arrow, E. A. Boardman	1 21 07	
Chance, Reginald Boardman	1 22 50	
Domino, C. C. Clapp	1 24 33	
Miladi II., F. R. Adams	1 24 45	
Myrmidon, W. C. Loring, Jr.	1 24 55	
Rattler, A. D. Irving	1 24 56	
Question, J. H. Hunt	1 27 10	
Piccadilly, C. H. W. Foster	1 27 25	
Mirage, J. W. Olmstead	1 28 52	
Aspinquid II., C. M. Foster	1 29 03	
Humbug, Cole & Bacon	1 31 30	
Janet, C. F. Jaynes	1 31 32	
Nickack, E. B. Holmes	1 35 43	
Yo San, R. J. Randolph, Jr.	1 36 10	
Walada, W. W. Rouse	1 47 08	
Class D—Handicap.		
Gringo, W. H. Brown	Elapsed.	Corrected.
Setsu, Talbot & Lewis	1 41 27	1 38 28
	1 39 38	1 39 38
Class E—Handicap.		
Ruth, H. S. Wheelock	1 28 25	1 25 00
Dabster, Francis Skinner, Jr.	1 25 34	1 25 34
Suzanne, F. F. Brewster	1 28 10	1 28 10
Carmen, O. H. Johnson	1 38 05	1 33 49

Friday, Aug. 7.

The third of the midsummer series was sailed in a light southeast breeze. In the 25-footers Great Haste had the best of the start and led on the first short leg. On the beat to windward Sally VII. pulled out to the front, but carried away her mast, and Great Haste led over the rest of the course. Tayac had the best of the start in the 22-footers, but Opitsah V. soon went into the lead. On the beat to windward a shift of wind put Chief in first place. After turning the windward mark Opitsah V. again got the lead. Medric chased close after and near the finish caught and passed her. In the raceabouts Runaway Girl got the start and led all over the course. The 18-footers went over the starting line in a bunch. Arrow soon went into the lead, and she held it all over the course. The summary:

Class A—25ft.—Restricted.		
Great Haste, T. K. Lothrop, Jr.	Elapsed.	
Seboomook, E. A. Smith	1 52 42	
Sally VII., L. F. Percival	1 55 32	
Great Haste wins by 2m. 50s.		
Class B—22ft.—Restricted.		
Medric, H. H. White	1 55 54	
Opitsah V., S. H. & H. J. Foster	1 56 27	
Chief, S. C. Winsor	1 59 53	
Tayac, W. H. Joyce	Withdrew.	
Medric wins by 33s.		
Class C—21ft. Raceabouts.		
Runaway Girl, C. H. Tweed	2 03 12	
Baggarah, R. C. Robbins	2 04 05	
Idol, P. D. Gibson	2 06 15	
Tunipoo, C. A. Cooley	2 19 30	
Runaway Girl wins by 53s.		
Class D—Handicap.		
Gringo, W. H. Brown	Elapsed.	Corrected.
Setsu, Talbot & Lewis	1 59 18	1 56 57
Sally IV., H. W. Mason	1 57 44	1 57 44
Gringo wins by 47s.		
Class E—Handicap.		
Dabster, F. Skinner, Jr.	1 05 26	1 05 26
Suzanne, F. F. Brewster	1 06 52	1 06 13
Ruth, H. S. Wheelock	1 09 20	1 07 22
Carmen, O. H. Johnson	1 17 25	1 12 50
Dabster wins by 47s.		
Class F—18ft. Knockabouts.		
Arrow, E. D. Boardman	Elapsed.	
Chance, Reginald Boardman	1 04 44	
Question, J. H. Hunt	1 04 58	
Myrmidon, W. C. Loring, Jr.	1 05 41	
Rattler, A. D. Irving	1 07 15	
	1 08 04	

Domino, C. C. Clapp	1 08 19
Miladi II., F. R. Adams	1 08 31
Kalmuck, Livingston Davis	1 09 31

Janet, C. W. Jaynes	1 11 40
Nickack, E. B. Holmes	1 11 42
Walada, W. W. Rouse	1 11 54
Humbug, Cole & Bacon	1 12 16

Arrow wins by 14s.

Saturday, Aug. 8.

The special invitation race, winding up the race week, was sailed in a light southeast breeze. Great Haste and Seboomook were the only starters in the 25-footers. Great Haste got the start and led all over the course. In the 22-footers Medric got the start and led all the way out to the weather mark. After passing this Medric and Opitsah V. went into a luffing match, and Tayac got the lead by it. She held this to the finish. There was little choice in the start of the raceabouts, but Baggarah soon went into the lead and held it to the finish. The 18-footers, as usual, were over the starting line in a bunch. On the beat to windward Myrmidon pulled out a lead which she held to the finish. The summary:

Class A—25ft.—Restricted.	
Great Haste, T. K. Lothrop, Jr.	Elapsed.
Seboomook, E. A. Smith	1 56 08
Great Haste wins by 4m. 16s.	
Class B—22ft.—Restricted.	
*Tayac, W. H. Joyce	1 57 07

*Medric protests Tayac for crowding at C. Y. C. mark buoy 1.

Beverly Y. C.

BUZZARD'S BAY, MASS.,
Saturday, Aug. 8.

The second Corinthian race of the Beverly Y. C. was sailed in Buzzard's Bay, Saturday, Aug. 8, in a very light easterly breeze. In the 30-footers Mashnee got the start and led all over the course. Terrapin showed the same performance in the 21-footers. In the fourth class cats Allison won easily. Flickamaroo won a good race in the 15-footers. The summary:

30-footers.	
Mashnee, R. W. Emmons, 2d	Elapsed.
Arabian, Robert Winsor	2 15 53
Evelyn, John Hitchcock	2 16 27

Western Yachts.

Kayosh of Oshkosh.

CHICAGO, Ill., Aug. 15.—Commodore Libbey's Kayosh won its fourth race on Lake Winnebago yesterday and will represent Oshkosh Y. C. in the regatta of the Inland Lake Yachting Association, to be held at Oshkosh the closing week of this month. The Oshkosh men have planned a big time and an all-round gala occasion in sports for that week, and the event is very much worth the attendance of any yachtsman, or, indeed, a sportsman of any other sort.

At Ottawa Beach.

At Ottawa Beach Regatta, across the lake from Chicago, yesterday La Rita beat Little Shamrock and easily took the measure of Hoosier. Several boats failed to finish in the time limit in class 4A, and they go to the line again this morning, at which time there should start also Vencedor and Sallie, in class 1A, Iroquois, Doloma and Widsith, in class 2A, with others

variously classified. In the afternoon races of yesterday there was a sensational finish between Raven and Intruder, the latter being a Spring Lake boat. Raven won by a chance puff of air at the finish. Bonita won the junior specials. Summary:

21ft. Cabin Class—Start, 10:10.		
La Rita	Finish.	Elapsed.
Little Shamrock	3 04 25	3 54 25
Hoosier	2 18 00	4 08 00
	2 22 15	4 12 15
Judges: Chas. E. Scales, C. S. Roberts, William Cuthroll.		
Inland Lake Class—Start, 3:02.

Astrild, H. L. Eno	2 13 17
	2 23 23

Saturday, Aug. 15.

The 31-footers sailed the eleventh race of the series on Saturday, Aug. 15. The course was one laid out in the outer bay. The breeze was strong at the start, but softened somewhat toward the finish. Bat won, beating Indian, the second boat, 37s. The summary:

Bat, Edgar Scott	
Indian, W. C. Allison	Elapsed.
Cricket, W. G. Ladd	1 50 09
Ben, Stuart Bros.	1 50 46
Astrild, H. L. Eno	1 50 48
Joker, H. M. Sears	1 51 58
Scud, A. J. Cassatt	1 53 32
Curler, R. H. Gallatin	1 54 15
Kawana, J. B. Trevor	1 55 06
Zara, J. M. Sears, Jr.	1 56 22
Papoose III., V. E. Macy	1 56 32
Redwing, T. G. Condon	1 57 05
	2 02 37
	2 06 02

The Race Committee of the Seawanhaka-Corinthian Y. C. announce the following changes in the racing fixtures for this year:

The open races scheduled for Sept. 10, 11 and 12 will be held only for the raceabouts and Seawanhaka 15-footers, and instead of the usual series, a tournament match will be sailed on these days.

The Robert Center Memorial Cup is offered for the 30ft. class, belonging to club members.

A special race for the Seawanhaka 15-footers will be held on Aug. 15, and the first race for the challenge cup will be postponed until Aug. 29, if possible.

A race for the Seawanhaka 15ft. class will be held on Aug. 22, at 3:20 P. M.

The Roosevelt Memorial Cup will be sailed for by raceabouts on Labor Day, Sept. 7.

Hollis Burgess has sold (in conjunction with E. A. Boardman) the Bar Harbor 25-footer Tiger, owned by Geo. L. Batchelder, of Boston, to Chas. Platt, Jr., of Philadelphia. Also (in conjunction with Gardner & Cox), the 18ft. knockabout Nethla, owned by Frank W. Atwood, of Winthrop, Mass., to F. J. Navens, of New York. Chartered the 50ft. waterline schooner Sunshine, owned by Dr. John Bryant

The Canada's Cup Races.

Second Race, Monday, Aug. 10.

THE second race went to Canada by an unexpectedly easy margin. It seemed incredible that the boat, which had made a hair raising finish on Saturday, should be 10m. astern at the start on the following day, but that is what happened. The course was nine miles to windward and return, on this day, and the light breeze and absence of reaching prevented any fast time being made. The wind was from the southward with a spice of west in it, taking the boats right out into Lake Ontario for their windward work. The breeze was never more than eight miles in strength, and at times it was much less than that.

The race was lost at the start by Irondequoit getting a calm spot near the starting line. Strathcona floated over at a gentle pace 7s. after the gun was fired, but Irondequoit was 2m. 10s. behind the signal. The yachts were not widely separated, owing to the light breeze, and they both crossed on the starboard tack. Time at the start:

Strathcona11 00 07 Irondequoit11 02 10

Two minutes after Irondequoit had got over she came about on the port tack, followed promptly by Strathcona. The challenger footed about as fast as the Canadian boat, but she did not point so high, and the defender was rapidly eating out to windward of her, as well as going ahead. Irondequoit came about on the starboard tack at 11:27:30, but Strathcona was so far ahead that she did not worry about following her, and held the port tack until 11:29:15. Then she came about, and both were on the starboard tack until 11:50. When they came about at this time Strathcona was a quarter of a mile or more to windward, and the case of Irondequoit was hopeless. The port tack was a long one, bringing the yachts away to the westward, opposite Humber Bay. Both came about at 12:30, and Irondequoit set her largest jib topsail in place of the working one. It made her foot well, but she was going to leeward all the time, and after 10m. of experimenting it was taken in, and the working one set in its place, but slowly.

The starboard tack was also a long one, lasting until 12:50, when Strathcona broke tacks and headed for the buoy on the port tack. Irondequoit stood on 6m. longer, and then also came for the buoy on the port tack.

Time at the weather mark:

Strathcona12 54 43 Irondequoit1 01 41

Strathcona's spinnaker was set in 40s. after rounding the buoy, being carried to starboard. Irondequoit took 2m. 30s. in breaking out her spinnaker, and it spread very slowly. The stops seemed to be too heavy and refused to part, but the wing was spread at last and the challenger followed tamely in the wake of Strathcona, at least a mile astern.

Irondequoit's course was remarkably different to that of Strathcona. By the time half the homeward course had been covered, she was at least a quarter of a mile to leeward. She hauled up at 2:25 P. M., but to get back on her course she had to take in her spinnaker and sail with her balloon jib for head canvas for 10m. At 2:35 P. M. she again set her spinnaker, but she was a mile or more away and was only making a poor second in a dull procession. The finish was, accordingly, by no means sensational, Strathcona having the enormous lead of 10m. 5s.

Time at the finish:

Strathcona2 48 47 Irondequoit2 58 52

Official summary of the race:

	Start.	Windward.	Mark.	Finish.
Strathcona	11 00 07	12 54 43		2 48 47
Irondequoit	11 02 10	1 01 41		2 48 52

Third Race, Tuesday, Aug. 11.

There was a council of war in the Irondequoit camp Monday night. Things were looking pretty blue, and 'tis said the atmosphere had a corresponding tint. It was Captain Barr who got the blame. Being nephew of Charlie Barr, of America's Cup fame, did not save him from censure. The loss of two races, one by a small margin and one by a big one, was exasperating. Designer Gardner, of Gardner & Cox, was particularly severe, as he had a reputation to lose if his product was beaten so. As a matter of fact, Barr was not entirely to blame for the loss of the two races. The Canadian crew won just as much by quick sail handling as they did by skilled maneuvering, and Barr could not be expected to be handling head canvas and the tiller at the same time. But at any rate, he got the blame, and it was decided to get Mr. Addison G. Hanan, of New York, to sail the boat, and the telegraph wires ticked accordingly.

Addison Hanan is a name to conjure with. His reputation had reached Toronto long before the Irondequoit was in the water. The Canadians had expected him to sail the boat at the start. His record of last season in Dorwina and Effort, and his record this year of eleven starts in Long Island Sound, and eleven first places, were enough to cause him to be regarded with respect and awe.

Mr. Hanan had not much time to reach Toronto. Irondequoit left her island moorings about half past 9 Tuesday morning and stood across to the city, coming in stays opposite the Royal Canadian Y. C. pier, but as there was no Hanan on the yacht club balcony, she filled away on the opposite tack and stood out to the race course with Captain Barr at the tiller. But the 10 o'clock train brought Mr. Hanan to Toronto; and without delaying for parley, he went aboard the steam yacht Navajo and started in pursuit of Irondequoit as fast as triple expansion engines could speed him. The Navajo reached the course in time and put the skilled amateur aboard, taking off Designer Gardner in his place. There was also a change aboard Strathcona, James McMurray, one of the amateur crew in charge of the headsails, being replaced by Wm. Fisher, the professional, who was forward in Invader when the latter carried off the Canada's Cup at Chi-

cago two years ago. Mr. McMurray was unable to sail in this race, owing to the death of his brother.

Captain Barr, in Irondequoit, went forward and took charge of the headsails, and ever after a noticeable improvement was shown in this line. The yachts hugged one another closely at the start, but the challenger got the best of it. Strathcona's balloon jib had been sent up in stops, but in the fresh breeze it started to break out, and had to be gathered down on the horn. Irondequoit's biggest jib topsail was broken out immediately on gun fire, and she crossed the line in advance of Strathcona. Skipper Jarvis, anticipating a luffing match and perhaps a battle at close quarters, was wise enough to keep his balloon on the horn until he found where he was at, but Strathcona, under reduced head canvas, did not travel so fast.

Time at the start:

Irondequoit11 00 18 Strathcona11 00 35

The course was again a twenty-one-mile triangle with a westerly wind, and the judges' signal, "All buoys to starboard," made it a reach and a beat and a reach again. There was plenty of wind, the velocity ranging from twelve to fifteen miles an hour, and there was a crisp, choppy sea, which flew in sheets from the cleaving bows of the racers.

After Irondequoit's performance reaching on Saturday, it surprised no one that she should outfoot the defender in the first leg of the triangle. Indeed, the surprise was that the difference between them was not greater at the end of the first seven miles. They sailed very evenly, and the challenger's gain was comparatively slight.

Time at first buoy:

Irondequoit11 50 46 Strathcona11 52 21

Elapsed time showed that Strathcona had just lost 1m. 16s. since the start.

But to the surprise of all Irondequoit stretched away like a greyhound when they jammed on the wind for the third to the second buoy. The stiff breeze heeled her until her weather bilge was clear of the water, and with the white waves churning in over her tumble home on the lee side, she plowed grandly through and over the seas, liking the rough going, footing fast and eating steadily to windward. It was a complete reversal of her previous windward performances, and strangers marveled at the burst of speed she was showing under the management of the new skipper. The yachts were not close enough together when they hauled on the wind to bring about a battle of short tacks, and they worked away to the westward in long, steady stretches. It was piping too hard for jib topsails to be of use in the first part of the beat, at any rate, but at 12:18 Skipper Jarvis ventured a baby jib topsail, which seemed to draw him along well. Strathcona pounded hard in the seas, the water shooting in cataracts about her bows, and Irondequoit, with the longer overhangs, took the seas much easier. She was sailed very high, Hanan reversing Barr's tactics of making her foot at the expense of her pointing. She sailed grandly under mainsail, staysail, jib and club topsail, the latter always a-flutter as it lay off a little more to leeward. Soon she had a quarter of a mile to the good.

The second buoy was only reached after an hour and a half's thrashing through jumping seas. There was not what is considered a big sea for Lake Ontario by any means, but it was a short, choppy jizzle that made things interesting for sailing craft, and put the passengers aboard many of the pleasure steamers hors de combat. Irondequoit led by 4m. 32s. at the second mark, having gained nearly 3m. in the windward work, which was supposed to be Strathcona's great hold.

Time at the second buoy:

Irondequoit1 19 22 Strathcona1 23 54

The wind held true out in the lake, but further inshore it had hauled a point or so to the northward, so that the third leg, begun as a broad reach, wound up as a close one. The only difference in canvas was that Irondequoit carried a reaching jib topsail and Strathcona set her balloon jib. The yachts came home at such a pace that steamers that had been plunging and spluttering about while they were beating to windward found themselves caught and passed. The judges' boat for the day was the steam yacht Tranquilo, and she could not keep up with the racers. They rushed past steamer after steamer, and the only steam craft to take their time at the finish was the Gooderham yacht Cleopatra.

Irondequoit shortened down half way in, and relieved of her jib topsail, she made better time. It was blowing so hard that the balloon jib threatened Strathcona's topmast every minute, but Skipper Jarvis grimly hung on to it as long as it would draw, shifting to working jib topsail when he had to flatten in sheets. It was a gamely sailed race, but Irondequoit gained on this, as on the other legs of the triangle, picking up 53s. and finishing with a half mile lead.

Time at the finish:

Irondequoit2 15 05 Strathcona2 29 19

Official summary of the race:

	Start.	First Buoy.	Second Buoy.	Finish.
Irondequoit	11 00 18	11 50 46	1 19 22	2 15 05
Strathcona	11 00 35	11 52 21	1 23 54	2 29 19

Fourth Race, Wednesday, Aug. 12.

Toronto yachtsmen were glad to see Irondequoit win the third race. After their easy victory on Monday the cup looked safe, and to keep up the courage of the challengers and the general interest in the sport, they were quite willing to lose the third race or even the fourth race—that is, always providing the fifth race should go to Strathcona. That, at least, was the public feeling; what Commodore Jarvis thought about it may be a different matter.

Conditions Wednesday morning favored the challenger. The wind was light, out of the north and north-west, and having blown off shore all night, the water was smooth. There was plenty of wind for a finish well within the time limit, but not enough to bother Strathcona. Prospects of her saving the cup were good on Wednesday. There was the additional favoring circumstance that the course again only involved windward and leeward work, being nine miles to leeward and return.

The start showed that both skippers were out for blood. The yachts rushed over the line with balloon canvas forward and spinnakers aloft in stops, but spinnaker booms still inboard. They went over the line with the wind over the port quarter.

Time at the start:

Irondequoit11 15 20 Strathcona11 15 30

The fight for the weather berth was better. Strathcona hung on Irondequoit's weather counter like a deerhound on the flank of a hunted stag. Luff, luff, luff was the order, and the yachts stood off to the eastward, an eighth of the compass off their course. Their wake became an arc, and soon they were tearing through the water close hauled on the wind, with balloon canvas slatting wildly. They were heading into the eastern piers of Toronto harbor when they gybed. Strathcona tried in vain to pass to leeward, and another gybe followed, and a luffing match succeeded it, Jarvis clinging tenaciously to a position on Irondequoit's weather quarter, until, after nearly 15m. of sailing, he gybed suddenly and stood back to the true course, setting his spinnaker when a quarter of a mile to windward of Irondequoit. The move was a repetition of the preceding Saturday's tactics on a grand scale—shooting across the wake of an opponent and throwing the silken cloud of the spinnaker to the breeze as soon as well clear.

It looked like a Canadian victory, and, indeed, it was one, although not final. From his position Jarvis was able to lay the buoy directly. Hanan, to avoid sailing by the lee, had to gybe over. Strathcona footed along beautifully, a quarter of a mile to windward and leading 200 yards.

But two miles from the buoy luck went against the defender. The breeze lightened. Then she struck a long roll, the remnant of dead sea after the preceding day's tumble, galvanized into life by the brisk north breeze early in the morning that had escaped from the lee of the land. Strathcona's sails slatted and banged about and spilled every breath. For a time she rolled helpless, her slack bilges allowing her to sway down until her decks were almost awash—and never a breath to steady her. And 300 yards off, on the port beam, the challenger was shouldering through the roll, swaying steadily upon the support of her full bilges, spilling a little wind, but carrying her lofty club topsail full all the time. This was the fateful moment of the race, the fateful moment, indeed, for the Canada's Cup. By the time Strathcona was swinging through the roll, instead of on it, the challenger had a lead of nearly half a mile, and to overtake her was hopeless.

Time at the leeward mark:

Irondequoit10 01 34 Strathcona1 04 26

And then the wind bit in steady and true, twelve miles strong at times, giving the yachts, with their loftiest canvas, all they could stagger under. They were too far apart for much to be accomplished by maneuvering; but Skipper Jarvis tried a bold ruse. His first port tack was a long one. Had Hanan held it as long as Jarvis desired, Irondequoit would have run into the calms that prevail off what sailors call The Highlands and landmen call Scarboro Heights, the 200ft. sand cliffs that line the shore east of Toronto. Strathcona, the following boat, would have been able to get away with a fresh breeze, while Irondequoit lay dead. Such, at least, seemed Jarvis' plan, but Hanan spoiled it by breaking tacks with him, instead of overstanding the distance. And after that it was plain, straightforward thrashing, with the Strathcona crew on her weather rail to help out her slack bilges. Strathcona was well sailed, and steadily drew nearer Irondequoit, but she had not far enough to go to overhaul her, and so lost the fourth race.

Time at the finish:

Irondequoit3 12 13 Strathcona3 13 31

Official summary:

Windward work	1 10 39	1 08 55

Fifth Race, Thursday, Aug. 13.

The fifth and deciding race of the series was just as uncertain as any. The weather conditions in the morning favored Strathcona. The wind was northerly and light, and, after the manner of such summer breezes in the vicinity of Toronto it might have been expected to swing to the westward before night, following the sun steadily around. But the breeze did not act according to schedule. In two hours it had backed into the south-southwest, and there it held, disproving for once the old adage:

"When the wind shifts against the sun
Trust it not for back 'twill run."

Once it had settled to an eight-knot breeze it blew true and steady from one quarter.

Excitement was high in Toronto. Canadians are naturally optimistic, and while they were greatly alarmed for the fate of the cup, not a few expected their favorite Æmilus Jarvis to put forth a strong hand at the proper moment and save the trophy. If the effort required was superhuman, they expected it all the same. Besides, were not weather conditions in the defender's favor? To offset the disadvantage of a triangular course, there was the light breeze and smooth water. Strathcona looked to them a winner.

The spectator fleet was fairly large Thursday, and crowds lined the piers and shores. The maneuvering

before the start was as pretty a sight as could be seen in a lifetime. Hanan had no fear of Jarvis, and the latter was intent on a weather berth. For fully ten minutes before the signal the boats alternately gybed and stayed, and Strathcona kept the weather berth every time. Their jockeying brought them away to windward of the line, and as the judges' boat flew the red flag, for buoys to port, they had to wear and stand down, although they kept their mainsheets trimmed flat aft. It was in rounding the stern of the Cleopatra that Hanan cut in to windward, and when the whistle blew he crossed first, with Strathcona so close that main boom and bowsprit seemed touching. Strathcona broke out her jib topsail as she rounded the judges' boat, and Irondequoit was a trifle slower in setting her headsail, sheeting it home just on the signal. Skipper Jarvis tried a battle of short tacks, believing that Strathcona might stay quicker, but gained nothing by this in rom. incessant work. Strathcona's headsails were trimmed down a trifle faster each time, but Irondequoit was quite as quick in answering her helm, and every time she came about she was a little more to windward and ahead.

Time at the start:
Irondequoit11 15 09 Strathcona11 15 35

The yachts crossed the line on the starboard tack, but they only held this for 2m. About they swept, for an equally short port tack. The starboard tack that succeeded this was so very short that it was little better than a luff, the headsails barely drawing before they shivered again with the helm a-lee. The port tack following lasted 6m., and the succeeding tacks were longer. It was Skipper Jarvis who set the pace in tacking, but Mr. Hanan watched him like a cat watches a mouse, and so carefully was every movement aboard Strathcona noted and interpreted that although her helm was always put over first, the yachts swung as though controlled by one rudder, and it was not even a matter of seconds between them in coming about. Skipper Hanan gave a beautiful exhibition of rigid adherence to the principle of always keeping between the buoy and the following boat.

It was 12:15 when the two contestants filled away on the long port tack that laid the buoy. Irondequoit was by this time 200 yards in the lead, with Strathcona directly astern, as both could lay the buoy without pinching. It was a rude shock to all who had banked on Strathcona's windward qualities to find her thus out-distanced in her own weather, and it could hardly be explained by the change in skippers on Irondequoit, for in the windward work of the preceding day, under adverse weather conditions, Strathcona made better actual time than Irondequoit. It was a rather puzzling piece of conduct on the part of both boats.

A quarter of a mile from the first buoy Irondequoit's working jib topsail was taken in and her reaching jib topsail was sent up in stops. The move was not executed in remarkably fast time, and indeed it seemed a little previous, but the balloon canvas was broken out smartly just as the turn was made. Strathcona, on the other hand, carried her working jib topsail around the turn, then dowed it and sent up a balloon jib. It took 3m. to execute this maneuver. At least that was the time Strathcona was sailing under working jib and balloon staysail as her only head canvas.

Time at the first buoy:
Irondequoit12 47 50 Strathcona12 49 29

Strathcona's balloonier tugged her along in splendid style and she slowly but steadily gained on the fleet- ing Irondequoit. Both yachts took in their working jibs to give the balloon canvas free play, but Skipper Hanan realized that if he was to hold his lead he would have to change his head canvas, and at 1:30 P. M. his reaching jib topsail came in and a big balloon jib, filling the whole fore-triangle, was broken out, the move being made in admirably quick time. This helped Irondequoit along somewhat, but still Strathcona had cut down her lead on this broad reach by about half a minute by the time the second seven miles were ended.

Time at second buoy:
Irondequoit1 42 27 Strathcona1 43 39

A gybe over at the second mark brought mainsails to starboard. It was again a broad reach, under the same canvas, Strathcona carrying balloon staysail and balloon jib forward, and Irondequoit having nothing to interfere with the draft of her balloonier. If it had only been a spinnaker run, Strathcona could have at least caught Irondequoit in the last seven miles, and there would have been an exciting battle of gybes for the finish, but the wind held true and the last hopes of Canadians vanished. Strathcona did not repeat the surprise of the preceding day in sailing faster than Irondequoit on her best point. At times she footed faster, but on the whole she had hard work to hold her own on the run in.

Time at the finish:
Irondequoit2 40 55 Strathcona2 42 17

And so the Canada's Cup was once more lost and won. The official time of the last race is:

	Irondequoit.	Strathcona.
Start	11 15 09	11 15 35
First buoy	12 47 50	12 49 29
Second buoy	1 42 27	1 43 39
Finish	2 40 55	2 42 17
Elapsed Time.		
First leg	1 32 51	1 33 54
Second leg	0 54 37	0 54 10
Third leg	0 58 28	0 58 38

CHARLES H. SNIDER.
TORONTO, Aug. 13.

Tarantula, the turbine steam yacht purchased by Mr. W. K. Vanderbilt, arrived at New York on Aug. 12. The yacht was conveyed as far as Hamilton, Bermuda by a tramp steamer, and from there she went to Newport News, where she was joined by her owner, who made the trip to New York in her. Tarantula was designed by Messrs. Cox and King for the late Col. Harry McCalmont. She is 152.5ft. long, 15.3 breadth and 8.4ft. deep. On her trial trip she made a speed of 26.75 knots.

Regulations for Cup Races.

THE rules for patrolling the courses in the international yacht races will be if anything more strict than they were in 1901. The rules were arranged by Secretary George B. Cortelyou, of the Department of Commerce and Labor, after consultation with Secretary Leslie M. Shaw of the Treasury. They are as follows:

Rule 1.—Observe carefully the movements of the patrol vessels, and carry out promptly and cheerfully the instructions received from them. These vessels will fly the Revenue flag at the mast-head, and these only are hereby authorized to enforce the rules.

Rule 2.—A clear space of half a mile about the starting line will be maintained until the race has been started. To accomplish this, presupposing that the race is to windward, the vessels of the First Division of the patrol fleet will be formed in column extending from the vicinity of the starting line to the left, in a direction four points from the wind. The Second Division will form a similar line four points to the right of the direction of the wind. The two lines of patrol vessels will thus form a right angle. All vessels, except the judges' and committee boats, or vessels carrying the patrol flag, must keep outside of the patrol lines. The space enclosed in the right angle thus formed will be reserved for the competing yachts. If, on the other hand, the first leg be to leeward, Rule 6 will apply.

Rule 3.—If, after crossing the line, the competing yachts stand on the port tack, the Second Division will form column and stand on a course parallel with them. All vessels outside the Second Division will take the same course. The First Division will form line and take the same course as the competing yachts. All passenger vessels outside of this line will head in the same direction, and be careful to keep astern of the line of patrol vessels. The entire fleet of vessels will thus be heading the same course with the yachts, and will be entirely clear of them. When the yachts tack, all patrol vessels will at once change course and steer the course taken by them. Passenger vessels will do the same. The Second Division will find themselves in line in this case and the First Division in column.

Rule 4.—When the competing yachts turn the stakeboat for the run in, all patrol vessels will head for the vicinity of the finishing point. The First Division in column, inverted order, will head for a point half a mile to the right of the finish line. The second Division, in similar formation, will head for a point half a mile to the left of the finish line. Thus a clear space one mile wide will be maintained astern of and to windward of the competing yachts. But whether this space for the movement of the competing yachts be more or less than one mile wide, all vessels present for sight-seeing purposes must keep outside of the patrol lines. Any intrusion within the patrol lines, irrespective of the distance of the latter from the competing yachts, will be held as a violation of these regulations, and the offender will be rigorously dealt with.

Rule 5.—All passenger vessels will be careful not to cross astern of, or crowd in upon, the competing yachts on the run in, but will remain on the outside of the line of patrol vessels, and they must also avoid crowding about the finish line. This is imperative.

Rule 6.—If the race be to leeward and return the patrol vessels will form two parallel lines one mile apart, First Division to the left and Second Division to the right, and in this formation head the course steered by the competing yachts. Passenger vessels must keep outside of these lines and observe Rule 5. Until reaching the outer mark, Rule 4 will apply. When the yachts turn the outer mark and start on the beat back, Rule 3, with the patrol in inverted order, will be observed.

Rule 7.—Should the wind shift during any of the races, patrol vessels will immediately indicate the line to be formed, as in the rules laid down, and passenger vessels must keep outside of these lines with as little delay as may be consistent with safety.

All seafaring men will understand the difficulties in the way of keeping a triangular course clear, and it is hoped that the public will be patient with the rules, which must, from the necessities of the case, bar them from following the entire course. The fact that the competing yachts will be faster on the second leg of the course, with their sheets eased, than a majority of the vessels carrying passengers, renders it impossible to allow these vessels to follow the entire course. Therefore, the following rule becomes imperative and must be carefully observed:

Rule 8.—When the competing yachts reach a point on the first leg of the course, to be determined by the officer in charge of the patrol fleet, the patrol flags will be lowered to half mast and the steam whistles blown on all patrol boats. When this signal is made, all vessels carrying passengers will run at full speed for a position to leeward of the last leg of the course, and as near the second stakeboat as may be without approaching it nearer than a mile. The patrol boats will in this case establish a single line, the First Division in the lead, to the leeward of the line on which the competing yachts will run, and all passenger vessels must find themselves to leeward of this patrol line before the yachts turn the second stakeboat. On the run in all vessels must be careful not to cross the sailing line of the competing yachts, either ahead or astern of them, but keep to leeward of the patrol line until the race is finished.

The movement of the patrol fleet, steam yachts and excursion boats, across the triangle, from the first leg of the course (Rule 8) presupposes that the first or windward stretch of the competing yachts is to the right from the starting point. In the event that the direction of the wind is such that the Regatta Committee selects the left leg from the starting point as the first leg of the course, the movement of the patrol fleet, the steam yachts and the excursion boats—when the signal is given by the flag-ship—will be across the triangle to the right.

Rule 9.—A blank cartridge fired from any one of the patrol vessels will indicate that some vessel is persistently violating some rule. Prompt attention to this warning signal will obviate the necessity of sending the offender back to New York in charge of an officer of the Revenue Cutter service, and the revocation of the license of the master.

Racing Rules for Cup Races.

The Regatta Committee of the New York Y. C. has issued instructions that will govern the races between Shamrock III. and Reliance. The orders are as follows:

Start will be made from Sandy Hook Lightship at as near 11 o'clock as will be practicable, the preparatory signal being given fifteen minutes in advance.

But always with the understanding that should the direction of the wind prevent laying the course from the Lightship, the starting line will be shifted to the nearest available point, and that in this case the preparatory signal will be given about half an hour later than the time set for starting from the Lightship.

Courses.—No. 1, Letter S.—From the starting line to and around a mark 15 miles to windward or less and return, leaving the mark on the starboard hand.

No. 2—Letter T.—From the starting line, 10 miles to and around a mark; 10 miles to and around a second mark, and 10 miles to the finish line, leaving the marks on the outside of the triangle, to port or starboard, according as the vessels are sent around.

Starting and finish lines will be between a point on the committee boat, indicated by a white flag, and the mainmast of the lightship, or other stakeboat, if the start is shifted from the Lightship. These lines will be at right angles with the outward and home courses, respectively.

Compass Courses (Magnetic) will be set before the preparatory signal is given. The signals for Course No. 2 must be read beginning forward. Marks will be white floats carrying a red ball with horizontal white stripe showing letters N. Y. Y. C. in blue, and surmounted by a flash cone. The position of each mark will be indicated by a two-masted vessel lying about 100yds. beyond, and swinging a red ball from the triatic stay. Should the mark be wrecked, its place will be taken by its marking vessel, which will display a red flag with diagonal white stripe in addition to the other indications, and in turning the vessel the direction for the mark will govern.

Starting Signals.—Preparatory.—A gun will be fired, the club signal lowered and a "blue peter" cone hoisted.

Warning.—Ten minutes later a second gun will be fired and a red ball hoisted.

The Start.—Five minutes later, a third gun will be fired, the blue peter cone lowered, and a second red ball hoisted.

Handicap Time.—Two minutes later a fourth gun will be fired and both balls will drop. Should a signal gun misfire, a prolonged blast of the whistle will be given. At the finish, a short blast will be given, as each vessel crosses the line.

Special signals.—*, answering pennant; A, accident; C, assent; D, negative; G, the start will be shifted from the Lightship; H,

Do you assent to postponing start until later in the day? I, Do you assent to calling race off for the day? J, Start postponed until later in the day. K, Race postponed for the day. L, There will be a race to-morrow. M, Race is off. P, Preparatory.

Fog.—The committee boat and the marking vessels, when not under way, will "at intervals of not more than one minute, ring the bell rapidly for about five seconds," and at intervals of two minutes will sound five short whistle blasts.

Best three out of five races, each 30 nautical miles in length, over ocean courses outside of headlands, and with a time limit of five and a half hours; the first, third and fifth races being 15 miles to windward or to leeward and return, and the second and fourth around a triangle 10 miles to a leg. In every case the outward course shall be laid to windward, if possible, from Sandy Hook Lightship. The races will be sailed on Thursdays, Saturdays and Tuesdays, commencing on Thursday, Aug. 20. An unfinished race of one kind shall be repeated until decided. The starting line shall be established and the compass course signalled as early as practicable, and the vessel laying the course shall be started ten minutes prior to the preparatory signal. In case a serious accident occurs to either vessel prior to the preparatory signal, she shall have such time, not exceeding in any event four weeks, as the respective committees of the New York Y. C. and the Royal Ulster Y. C. shall determine to be reasonable, to effect repairs before being required to start; or, if such accident occurred during a race, before being required to start in the next race; but no such allowance of time to repair shall permit of any race being sailed after Oct. 31, 1903.

If either vessel be disqualified in any race, such race shall be awarded to the other vessel, whether she shall complete the course within the time limit or not. If through the fault of either vessel, the other be totally destroyed, or so injured as to be incapable of repair, and the latter shall be free from fault, the match shall be awarded to her. If in the opinion of the Regatta Committee, the weather shall at the time appointed at the start of any race, be or threaten to be of such severe character as not to afford a reasonable opportunity of fairly testing the speed of the two vessels, the race may be postponed in the discretion of the Regatta Committee, unless either contestant shall insist upon its being started. Each vessel shall stand by the consequences of any accident happening to her after the preparatory signal, and upon the occurrence of any such accidents disabling either vessel, the other shall sail out the race. The committee may postpone the start in case of accident, as stated; if the course cannot be laid from the lightship; if in their opinion the space around the starting line is not sufficiently clear, in case of fog, and if both vessels agree to a postponement, in which case the committee shall determine the time of the start. But no race shall be started after 1 o'clock.—From the Mutual Agreement.

The Committee Boat.—The Navigator.—Will display the committee flag, and at the finish will also show a red ball. The courses will be laid by the John S. Scully, in charge of Lieut.-Com. W. J. Sears, U. S. N. (N. Y. Y. C.). The Coastwise, in charge of Lieut. H. C. Poundstone, U. S. N. (N. Y. Y. C.), will be the guide vessel, and in running the courses she will show two red balls hung horizontally on the fore. The Unique, in charge of Com. Henry Morrell, U. S. N. (N. Y. Y. C.), will serve as an emergency vessel, and should the start be shifted from the Lightship, she will serve as stakeboat, and, like the committee boat, will show a red ball.

The America's Cup Record.

THE history of the America's Cup is told in the inscriptions upon it, which read as follows:

100 Guiana Cup, won Aug. 22, 1851, at Cowes, England, by yacht America, at the Royal Yacht Squadron Regatta, "open to all nations," beating cutters, Volante, 48 tons; Arrow, 84 tons; Alarm, 193 tons; Mona, 82 tons; Bacchante, 80 tons; Freak, 60 tons; Eclipse, 50 tons. Schooners, Beatrice, 161 tons; Wyvern, 205 tons; Ione, 75 tons; Constance, 218 tons; Gipsy Queen, 160 tons; Brilliant, 392 tons.

Schooner America, 170 tons; Commodore, John C. Stevens; built by George Steers, of New York, 1851.

Presented to the N. Y. Y. C. as a challenge cup open to all foreign clubs, by the owners, John C. Stevens, Hamilton Wilkes, Geo. L. Schuyler, J. Beekman Finlay, Edwin A. Stevens.

1870.
Challenged to be sailed for over N. Y. Y. C. course, Aug. 8, 1870, by Mr. James Ashbury, with schooner yacht Cambria, representing R. T. Y. C. Cambria, beaten in the following order by schooner yachts: Magic, Idler, Silvie, America, Dauntless, Madgie, Phantom, Alice, Halcyon.

1871.
Oct. 16, 1871.—Schooner Livonia, James Ashbury, Esq., owner, vs. schooner Columbia, Franklin Osgood, Esq., owner. Columbia winner by 27m., 4s.; N. Y. Y. C. course.

Oct. 18, 1871.—Schooner Livonia vs. schooner Columbia. Columbia, winner, by 10m., 33s.; outside course.

Oct. 19, 1871.—Schooner Livonia vs. schooner Columbia. Livonia, winner, by 15m., 10s.; N. Y. Y. C. course.

Oct. 21, 1871.—Schooner Livonia vs. schooner Sappho; Wm. P. Douglas, Esq., owner. Sappho, winner, by 30m., 21s.; outside course.

Oct. 23, 1871.—Schooner Livonia vs. schooner Sappho. Sappho, winner, by 25m., 27s.; N. Y. Y. C. course.

1876.
Aug. 11, 1876.—Schooner Countess of Dufferin, Chas. Gifford, Esq., owner, vs. Madeleine, John S. Dickerson, Esq., owner; Madeleine, winner, by 10m., 59s.; N. Y. Y. C. course.

Aug. 12, 1876.—Schooner Countess of Dufferin vs. schooner Madeleine. Madeleine, winner, by 27m., 14s.; outside course.

1881.
Nov. 9, 1881.—Sloop Mischief beat sloop Atalanta; Bay of Quinte Y. C. (Canada); 28m., 39¼s.; N. Y. Y. C. course.

Nov. 10, 1881.—Sixteen miles to leeward from buoy 5, Sandy Hook and return, sloop Mischief beat Atalanta 38m., 54s.

1885.
Sept. 14, 1885.—N. Y. Y. C. course, sloop Puritan beat cutter Genesta, Royal Yacht Squadron of England, 16m., 19s.

Sept. 16, 1885.—Twenty miles to leeward of Sandy Hook Light Ship and return, sloop Puritan beat cutter Genesta 1m., 38s.

1886.
Sept. 9, 1886.—N. Y. Y. C. course, sloop Mayflower beat cutter Galatea, Royal Northern Y. C. of Scotland, 12m., 2s.

Sept. 11, 1886.—Twenty miles to leeward of Sandy Hook Light Ship and return, Mayflower beat cutter Galatea 28m., 59s.

1887.
Sept. 27, 1887.—N. Y. Y. C. course, sloop Volunteer beat cutter Thistle, of Royal Clyde Y. C. of Scotland, 19m., 23¼s.

Interstate at Ottawa.

OTTAWA, Ill., Aug. 14.—The Interstate Association gave another of its successful series of tournaments here this week under the auspices of the Rainmakers' Gun Club. The attendance was not as large as expected, due partly to the fact that no added money was offered, and possibly also owing to the number of other tournaments crowded into the Western circuit this month. Elmer Shaner was at the helm, as usual, and left nothing wanting in any detail.

Weather the first day was quite pleasant, and scores averaged good. Hughes and Powers tied for first place with the excellent score of 170 out of the 175. Spencer was second, two birds behind them, while Connor and Riehl tied for third with 161.

Rain cut short good scores midway in the programme of the second day. On the first hundred Riehl and Powers were high with but three lost, but the latter finished stronger, and easily got top place for the day. Spencer got second and Hughes and Brown third. Powers, Spencer, Hughes and Riehl finished in the points for the meet.

The programme was at 175 targets each day.

First Day, Aug. 12.

Events:	1	2	3	4	5	6	7	8	9	10	Broke.

WESTERN TRAP.

Garfield Gun Club.

CHICAGO, Ill., Aug. 15.—The appended scores were made on our grounds to-day on the occasion of the second trophy shoot of the third series. Dr. Shaw won Class A trophy on a straight score of 25. R. Kuss, a visitor, tied the score, while Pollard, Meek, Ellis and Hartway were right after him with 24 each. Hartway, being a Class B man, won in his class. Bullard won Class C on 22.

The day was very cloudy and dark, and rain fell during several of the events; but notwithstanding the threatening weather, thirty shooters put in an appearance for the afternoon's sport.

Trophy event:

Events:	1	2	3	4	5	6	7	8	9	10

No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

THE AUTOMOBILE AND THE ROAD.

At the present time the big high-power and high-g geared automobile, considered as a vehicle of passage, holds its chief place among the belongings of the wealthy. It is in every particular essentially a vehicle of the classes who can afford to spend their money liberally. The first cost of it is prohibitive to the man of ordinary means, and to the man whose means are above the ordinary and who could afford the first cost, the second cost, that of maintenance, would likely prohibit its ownership. While in theory it only costs about two cents a mile to run an automobile, in practice it costs nearer to ten times as much. Therefore, during a long time to come, in ownership it undoubtedly will be confined to the cultured, wealthy class of leisure, to whom the phrase *noblesse oblige* has always been considered as being specially applicable. Yet, in the relatively few years in which automobiles have been in use, there is a well grounded public resentment over the lawless manner in which they, as a rule, are driven. The average chauffeur has a contemptuous disregard for anything that runs counter to his caprice or inclination. To him the average pedestrian or horseman is as naught. Legal restrictions as to the limit of speed are violated openly and flagrantly at every opportunity. If a man is bowled over the chauffeur turns on more power and escapes expeditiously. If a horse takes fright, overturning the carriage or running away in consequence, the average chauffeur heeds it not. He speeds away with a conscious feeling of contempt, power and immunity. The rights of other people are, as a rule, wholly disregarded. It is true that all who act as motormen to automobiles do not do so; but it is equally true that the majority do violate constantly all the rules of the road, statutory and common, and all the rules of common courtesy as well. One need but to station himself at any of the great thoroughfares in New York, or its suburbs, to obtain ocular proof of this statement. On some of the best and most attractive roads in the country adjacent to the city it has been found necessary to provide special officers to confine the use of the automobiles within certain safe legal limits, or to arrest the chauffeurs who were defiant and refractory. The man with the automobile has no more rights on the public highway than has the humblest man with the humblest wheelbarrow. A continued disregard of public rights on the part of automobilists is sure to work decided harm to automobile interests in the day. In itself automobiling is one of the best of pleasures; conducted recklessly, it is one of the most irritating and dangerous of public nuisances. For the good of themselves and for the good of the sport in general, those who now recklessly disregard law and property when running their machines, should reform. The public is slow to act, but when once thoroughly aroused, it is likely to overtake. The people in their might can take active means to enforce their restrictions, and they can further mitigate the evil by reducing the temptation to maintain it. The man who has a 30 or 40 horse-power machine is constantly tempted to pass everything else in sight. If called upon to justify the use of such a high-powered machine on the common highways of the people, he would find extreme difficulty in doing so. The public could force a reduction of speed by limiting the power of the machines allowed on the public highways. This is advanced as a suggestion of what might happen if the abuse of the highways by chauffeurs shall grow in the future. Useful from the viewpoint of utility or pleasure, devotees should seek to popularize it instead of making it a subject of public menace and odium. And those who practice it, being of great wealth and high station, should avoid fostering the greater class prejudice of the multitude directed against the smaller class who should keep in mind the phrase *noblesse oblige*.

WORDS.

THE English language is not very old, and the spoken and written tongue of to-day differs strangely from that of five hundred years ago, while a thousand years ago there was no English language. Similarly the tongue spoken in the United States differs in some degree from that used in Great Britain, and the speech of each country is changing from day to day. To each are constantly being contributed words from other languages. Every nation of Europe, but above all the German and the Latin tongues, are adding daily new terms, which, while strange at first, soon become incorporated in the language, and take their places in the dictionaries and finally in the best literature. New terms, not from foreign tongues, are continually being coined, and the slang of to-day may become the colloquial speech of next year, and enter into the written language of ten years hence.

In a new country like our own, made up of a heterogeneous mixture of races, from each of which words are likely to be drawn, additions such as these come rapidly. To say nothing of the fact that the Americans of to-day are made up of all the races of Europe with not a few from Asia, Africa and the islands of the western seas, is the fact that both on the north and the south the English-speaking United States territory has long been rubbing against peoples speaking different tongues, and the further fact that gradually being incorporated into our body politic are many tribes of the native American race, which, while we sweep over, absorb and obliterate them, still leave their impress on us as a nation.

Along the northern border of the United States the French have exercised an important influence on the spoken language, and in the same way on the south words of Spanish origin have come to be generally adopted and commonly used in writing as well as in speech. Words of Indian origin have come into common use and crowd our vocabulary, and it is not long since an eminent scholar, Prof. Alexander F. Chamberlain, of Clarke University, printed a list of 132 words now commonly used, many of which are so familiar that it surprises us to learn that they have come to us from the red man. Of the foreign words which have become a part of the language spoken in the United States, very many have been given by outdoor men, by hunters, fishermen, cowmen, travelers in the wilds.

It is in the West where, for nearly 300 years before men of English stock traversed it, the country was run over by the Spaniards, or in the Northwest, where the French trapper—the *coureur de bois*—was for generations pushing his way further and further from civilization, making friends with the natives, marrying their women, and rearing his "dusky brood," that the names of French and Spanish origin were chiefly applied, and occasionally such terms underwent curious transformations. The French trapper, for example, called the dry dung of the buffalo—often so useful as fuel—*bois de vaches*, or cow wood, which the American, many years later, translated, retaining the sense, though the sound was too much for him, and called "buffalo chip." There is no commoner word in the West than "cache," from the French *cacher*. Cache is used as a verb, to hide, or as a noun, meaning things hidden, or a place where things may be hidden. Another word very common in the Northwest is "cooly," properly, of course, "coulee," from the French *couler*, to flow, hence a ravine, a "draw," a place where water flows, a (dry) water course.

Some of the most familiar Western words are of Spanish origin. Every one is familiar with the term "cinch," from *cincha*, a girth. Cowmen commonly speak of the "caviya," the herd of horses, from the Spanish *caballo*. Caviya is pronounced in many ways in different places. The term *caballo*, by the way, appears in a phonetic form in the familiar pseudonym of our contributor Cabia Blanco, or White Horse.

An Indian word coming to us through the Spanish is the familiar "coyote," pronounced kă'ot, or koi o'ti; the Aztec word was *coyotl*, meaning the little prairie wolf.

Among the words which we have got directly from Indian tongues is "chipmunk," the little striped squirrel. Our word is from the Ojibwa term *atchitamo*, compounded of the two words *achit*, meaning "headfirst," and *am*, "mouth," and is given to the animal from its habit of running down trees head downward. The idea is ex-

pressed, if not exactly, at least nearly enough, in Longfellow's lines in Hiawatha:

"For hereafter and forever
Boys shall call you Adjidaumo,
Tail-in-air, the boys shall call you."

"Pecan," the nut and tree, is another word of Indian origin, as is also "hickory." The pecan is a fruit of a species of hickory, and the Cree and Ojibwa word *pakan*, meaning nut or walnut, shows the derivation.

Of such words of foreign origin many have only a local application, and this is especially true of certain substantives adopted by the English-speaking race now inhabiting the regions formerly occupied by the peoples who gave the names. Some of these local terms are hardly known out of the district where they are used; others have a very wide application. The term Adirondacks, from the name of a tribe of Indians once dwelling in or near the section to which the name is applied, is known throughout the world, and there are certain other terms which have a world-wide significance, of which *totem*, and words formed from it, is one of the best known.

By no means all the words adopted from foreign tongues survive as parts of the language. Many of them, used for a time, prove inconvenient, pass out of common speech, and are forgotten; others, long employed in a thinly-settled country, may be overwhelmed by a rush of new inhabitants, to whom they are unfamiliar, and who will substitute for them some better known word which will come into common use and be adopted by the following generations. Something of this sort may well enough happen in certain portions of the West, where the old generation has died out, and its place is now being taken by a multitude of settlers from the East, who will bring with them their own speech as well as their ways of life. A word formerly in common use in the Northwest, which is now rapidly being forgotten, is *apishamore*, a saddle blanket, usually of buffalo hide.

A word very familiar among the Canadian French, and much used wherever snowshoes are employed, is *babiche*, meaning a thong or string of leather, or perhaps, more exactly, of the skin of an animal. This word comes to us through the Canadian French, but is probably from the Mic Mac *ababich*, meaning string or cord.

ANDREW LANG, poking fun at the Browning clubs and Tennyson clubs, whose members assemble to read poetry together and try to find out what it means, avers that he would as soon think of taking part in the English fishing competitions with their excitement and shouting and hilarity. This is a matter of taste. Reading poetry and fishing both have their rewards, whether pursued in solitude or amid the crowd. The Browning clubs, though they may appear to an irreverent world to verge on the daft, must find some compensation in their Browningizing or they would not do it; and it is not to be gainsaid that the fishermen who go in noisy flocks also find delight in their peculiar way of practicing the gentle art. Fishing is not of necessity a solitary pastime; it is not always a "gentle" recreation. If quiet and solitude were essentials, the sport would be denied to hosts who participate in it. Angling competitions are to be discouraged for the reason that the tendency of them is to cause the wanton waste of fish and the depletion of the parent stock of fish. The element of competition in men is a quality which pervades most of our outdoor sports, from the sailing of the America's Cup race to the fishing of the solitary angler, whose ambition is to take a bigger fish to-day than his companion did yesterday.

FLORIDA fishing is so generally associated with winter that the summer resources of those waters are likely to be overlooked. As the population of the State is increasing the seashore is coming to be more and more a popular summer resort; and just now there comes from the East Coast reports of fishing which excels that of the winter months. The sea bass fishing at Ormond, Daytona, Seabreeze, and other points is excellent; while the Halifax is yielding many tarpon, which, while smaller than the giants of the Atlantic and the Gulf, have the same game qualities. Thus the Florida angler finds a zest in his fishing not less in degree than that of the Maine trout waters or the Minnesota bass lakes.

The Sportsman Tourist.

To Elysium by Buckboard.

In Three Jaunts—Jaunt the Third.

"A FINE mornin' fer bar! This hyar fog's stickier'n chewin' gum!" The speaker was Beaug; the hour 3 A. M. The buckboard's ex-passengers were wide awake, the horses stood saddled and ready, and a breakfast of ham, scrambled eggs and coffee, warranted to remove the hair from a dog's back, smoked before them. Thus seated in Cimmerian darkness, in Beaug's hog camp, on the South Fork of Eel, while the soft, salt fog filled their nostrils, they gave heed, between bites, to their host's final instructions. These were neither long, nor hard to remember. Beaug was to go on foot with the hounds—he preferred it so. The guests were to be mounted. They were to keep well in earshot of the dogs; but were not to try to follow them. "Stick to the ridges," was Beaug's caution. At the same time he dwelt on the necessity of being always on the ridge immediately adjacent to the canyon where the hounds were working. They were to take food with them—"Mebbe, hunt'll last all day; mebbe, two days; mebbe, bar'll tree in an hour!" They were to shoot at nothing but bear—"ceptin' lion"; i. e., panther. They were to approach the bear, when treed, from up hill, because the hounds would be on the side of the tree nearest to the bear; that is, they would be as close to the bear as the ground permitted, and if he heard any one approaching from behind, he would back down, claw up a few dogs and make off. If the chase led where the horses could not follow, they were to abandon the horses and proceed on foot—the horses would reach camp all right. Lastly, the first man at the tree was to shoot the bear!

Up a precipitous trail they ride, Beaug and his hounds in the lead; and so, for an hour, until they were as wet from the constant slapping of the fog-laden underbrush, as if they had been drenched in a cistern. A halt! It is Beaug at the bridle! "Thar's plenty berries 'round hyar," he is saying; "I'll stop hyar; you follow trail to top of ridge." "But how in thunder can we? I can't see my hand." "Hosses knows." And they did know, for just as the first, faint glimpse of dawn came and one felt, rather than saw, that it was day, they stopped, and Bob and Marin managed to make out through the fog-rack that they had reached the summit. Then a tedious wait, a smoke, more waiting, several smokes. For the twentieth time Bob's eyes strive to pierce the impenetrable mist, and he asks: "Where do you suppose Beaug is now?"—when—hark! clear and shrill, up from the canyon's depths it wells—that canine chorus! Let him who hears that music and yet feels no fire in his blood, no answering throb of pulse, no responsive thrill of nerve, no revel in his breast, scan well his shoulder blades for budding wings—for, surely, he is something more than human! It is the oldest music in this world of ours. Centuries unnumbered have come and gone, since first its wild, sweet cadence smote man's ear and filled his soul with gladness, and when the end of Time and all things comes, whether by polar ice-cap slow creeping over earth and sea, remorseless and immense, or by a fiery rain and kindled sphere, of this be sure—that in that last, dread hour, when helpless, hopeless man stands at bay before the ravaging elements upon a dying world, his faithful little brother will be there to share his doom and wail earth's threnody.

Hark! There it swells again! The very horses neigh and prick their ears. "Let's after them!" cries Marin. Along the ridge they spur, heedless of switching boughs and snare-like creepers—a headlong, breakneck race—while ever from the canyon's mist-wreaths floats that wild pæan. "Hold up!" cries Bob. "They are swinging back again." Both turn and scamper madly back to their first halting place; beyond it, and ever further; through redwood groves, where the fog broods; through wild pastures, flower-decked haunt of deer and bee; up a ragged mountain side, furrowed and seamed; across its rock-clad peak and down again through seas of fragrant thyme; across a burnt-opening, where the shy redwood-lily blooms unseen of men; through woods of madrone and scrawny scrub oak; through brush and more brush—and still the pack gives tongue, somewhere, beyond in that illimitable fogbank. It was then, at the third brush patch, that Bob and Marin parted. "I'm going down here," he said, and turning his horse on to a lateral spur, vanishes. Poor Bob! That turn costs him the finish.

Bridle in hand, Marin picks his way around that brush patch, and when he emerges from the timber his ears are greeted by that soul-stirring melody upon the ridge itself, an instant—then, beyond it. The bear has crossed the ridge! Down, straight down, into the canyon's heart the wild chase leads. Marin rides furiously. He reaches a point above the dogs—how far above them he cannot tell—when—Ah ha! "Dinna ye hear the pibroch?" There's no mistaking that. Treed at last! He essays the steep slope on horseback, dismounts and scrambles down and ever down into the chill, wet fog. Surely he must be beneath the tree, he thinks. The din of the baying is all about him—it seems to pervade the fog, the earth, the very foliage. A hand—this Beaug's—clutches his arm and draws him forward. "Shoot thar!" says a voice. Where? But—surely, that shadowy patch in branching oak is darker, fuzzier, than the fog about it? Stay! It moved! A long, deep breath; a moment's struggle, ere mind has mastered muscle; the ivory foresight shows clear and true upon it. R-r-rip! "Mite too low!" Beaug says, "Bar's comin' down!" Hunched, with buttocks first, he comes; but the second shot strikes him fairly in the back, and with a pig-like squeal he falls among the dogs. Knife in hand, Beaug flings himself upon him, brushing the hounds aside with hairy paw, as if they were house flies. All is over. Two hounds, deep scored, limp whining back. The bear lies dead.

On Bob's horse, blindfolded with Marin's coat, ere he would consent to receive the uncanny burden, they packed the bear into camp. He was very fat, Beaug

said, but not a very large one—four years old, about; his weight, perhaps 240 pounds. It was the only bear they got, that trip; although they hunted hard two days; saw "sign" in plenty, but it was mostly old. Bob shot an otter one afternoon, sunning himself before a cleft in the rocks—his home. Trout there were in myriads, but bear hunting is close kin to strenuous toil, and when the shadows began to lengthen in the canyon, or rather, when the mist-rack floated in and wove its aerial cobwebs, that rough shake-bed within the cabin called oh, so loudly, to tired limbs and aching muscles. And yet, ye of the teeming cities, soul-weary of the never-ceasing struggle of the pit where snarling man gnaws man, what would ye give for one such week, a day, an hour?

On the morning of the 15th, the opening day for deer, Beaug packed them out, herding the animals before him like some old-time Nimrod, while Bob and Marin, on foot, hunted the gulches, and Bob secured a big Pacific buck, that is a deer whose antlers tower straight upward from the frontal bone a foot or more before they fork; and Marin scored a most inglorious miss at five short rods! Tell it not in Gath! Next day brought better luck, and he, too, got his deer, and then—the road again. Beaug, whole-souled, single-hearted Beaug, strove hard to stay them; but there were other mountains to be climbed and other canyons to be explored, and the wanderlust was in their blood.

Just here, a digression. When the war with Spain was declared, one day, through the human herd that thronged a city office, strode Beaug Bowman—a big-horn among a flock of common sheep. In that lonely ranch upon the mountain top, those two, mother and son, heard the belated news, discussed it, and with her blessing he had come 250 miles on horseback to enlist. What it cost her to give it—let some mother's aching heart reveal! And here steps in the irony of fate. It chanced that a pudgy politician, eager to exchange his title of "General," acquired by comfortably filling an arm chair in the attorney-general's office in some western State, for the less-imposing but far more honorable one of Colonel of Volunteers, was engaged in recruiting, on paper, a cavalry regiment, on the bare chance that the President might be cajoled into giving him the coveted commission. Poor, unsophisticated Beaug! He knew all the tricks of "bar an' varmint," but the "Generals" slink-eyed runners knew wiles not practiced by their kin-folk in Mendocino forests. They trapped him. For days he gnawed his heart, while his friends—there were many in the city who had bivouacked with him in his own far, free country—seeing his woe and weariness of spirit at the long delay, urged him to let the "General" and his paper regiment go, and enlist in the California Volunteers. "Can't do it, boys! I done sign; I done give mah word to the General; it's tarnation hard, but I must stick it out," he said. At length, two of Beaug's friends, without his knowledge, sought an interview with the "General" and gave that embryonic man-of-blood a talk, straight from the shoulder. He signed Beaug's release; whereupon the bear hunter let out a warwhoop, hugged the crowd to the serious detriment of their ribs, and struck a bee-line for the volunteers' rendezvous. They snapped him up, but poor Beaug's company never got nearer the firing line than Oakland. In that comparatively peaceful suburb, out by the powder works, the greatest bear hunter of California, a crack rifle shot, and one of the most expert trackers in all the West, put in the long, hot summer patrolling camp. Here his friends sought him often with gifts. Not whisky or tobacco—he never uses either—but candy! For be it known, Beaug has as sweet a tooth as any of his bears!

As Goliath labored up the slope of Red Mountain—an endless slope it seemed—the wayfarers came suddenly upon a bedraggled object seated by the roadside, head in hands. It was their friend, the tramp of Mark West. He was in a pitiful plight; one shoe was gone, the other tied on with a bit of rope, gaped widely; his clothing hung in ribbons; his whilom air of self-complacent impudence had vanished with the shoe, and when he spoke it was in whispers, broken by fits of coughing. He said that he was sick and starving. He looked both. Three days before, it seemed, he had committed the unpardonable imprudence of stealing a young porker—unpardonable, because in Mendocino no hungry man need ever ask twice at cabin door for food. He had been seen, the country-side assembled, men and dogs; they hunted the thief through canyons and up mountains; by some miracle, he baffled the trackers; wandered hopelessly bemazed; stumbled on the road, famished, half dead. What to do with him was the question that perplexed the buckboarders. They debated it, while Bob cooked a hasty meal and Marin administered a teaspoonful of quinine in a half tumbler of whisky. One thing was certain, the man was in no condition to walk. On to the buckboard they packed the tramp, and Goliath, albeit protesting, bore him to the summit, where they left him, together with a small store of venison and provisions, with a shepherd. Kind-hearted Bob supplemented this gift with \$2.50 for stage fare—"For," said he, "that camel yarn of his was all right, and, besides, I feel toward him about as the old colored mammy down in New Orleans felt toward General Butler, when she hallooed after him: 'Good-by, Massah Butler! Good-by! You's never stole nawthin' frum me, honey!'" What became of the man, they never heard.

Blue Rock—one house upon a barren, wind-swept ridge, and that vacant—did not detain the travelers, but they supped that night with the sole inhabitant of Bell Springs, an aged German. Their diplomacy was sorely taxed, ere they could gain admittance. "Dose campers vas der Teufel," he grumbled; "Dey shooted me mein olt chackass for a deer last week alretty." This remark, be it understood, was made to Bob, the best game shot of his county, and Marin maliciously told the story on their return to civilization. Unto this day, when Bob shows up with a gun, some one is sure to inquire, anxiously, whether there are any jackasses loose.

Goliath, after a night in a comfortable barn and a double ration of hay and ground barley, made a record run to where the map town of Dark Canyon should

have been, but was not. A soap box, nailed to a white oak, marked its site. Somewhere, no doubt, in the shadowy recesses of that deep, blue gulch to the right of them, was tucked away a pioneer family, striving with an united effort to wrest a tiny patch of arable land from the virgin forest; but the travelers saw nothing of them, nor could they discern their house. At noon they halted beneath a magnificent tan bark, which, with a stone monument, marks the dividing line of Mendocino and Humboldt counties. The oak, crowning the summit of the divide, was evidently a favorite stopping place for passing wayfarers, and penciled in a clerkly hand on the stone at its base, appeared the following:

Jas. M. Hedges & Wm. F. Marks
reached here on bicycles from S. F.,
in 4 days, 16 hrs., 27 minutes.

Just beneath, in the crabbed fist of one more used to plow handle than to pen, was scrawled this line:

WICH THEM SAME IS 2 LIRS.

Bob exploded. "Don't you see the picture?" he cried. "Old Mizzourah, resting his tired team, sees the inscription and laboriously spells it out, letter by letter. He has traveled this road many a year, and as he reads his mind runs over in review every grade and gulch between here and Healdsburg, let us say! He has, of course, never seen a bicycle. The more he ponders over it the more the shameless mendacity of the assertion that any human being could traverse the distance in any kind of conveyance in four days is borne irresistibly home to him. Then he gets real mad about it; climbs down; fishes in his overalls till he catches a pencil stub, and tells folks his opinion of the character of men who seek to mislead the traveling public by promulgating such a wilful lie!"

Night overtook them, before they reached Harris, which was to be their outfitting point for their deer hunt, and they pitched their camp at a spring in a little hollow beside the road. It was Marin's turn to cook, and he had just set the coffee pot on to boil when the brush crackled and out stepped a plump forked-horn, almost into the fire. It seemed little better than murder to shoot him, but the larder was bare of fresh meat and both travelers were blessed with robust appetites. The buck was dead before he knew what had happened, and his liver, minced in cubes, with red peppers, bacon, salt, thyme and butter, was stewing in a pan five minutes after he made his debut. It was a most successful first appearance, too—if the reader doubts it, let him try deer liver *à la Marin*; but let him be generous with his butter and shun lard and cottolene, and all their works!

In those days Twomey was Harris and Harris was Twomey! The persuasive personality of this anything-but-sad "exile of Erin" vivified every nook and corner of that small community. Twomey was the hotel, also the general store, eke the livery, board and feed stable, Wells, Fargo & Co., the Oregon stage station, the blacksmith's shop—in a pinch, the bank! If one subtracted Twomey from Harris, the remainder could be packed off in a gunny sack. His poll was frosted—not so his heart. His blue eyes, undimmed by years, laughed from a face, clean-shaven, save for a fringe of snowy whisker. His dress was broadcloth, with an immaculate shirt and old-fashioned black satin stock—and this in a country where the lord of 20,000 acres felt himself regally appalled if he shed his "chaps" and donned a blue flannel shirt, new overalls and a clean neckerchief! In short, Twomey looked like an ancestral portrait, and talked like an Hibernian angel who had been temporarily sojourning in southern Missouri! The voyagers required pack animals—Twomey procured two mules—created them, it almost seemed. They sought a hunting ground—Twomey knew the very place, a shepherd's deserted cabin, on the big divide over in Trinity, between Mad River and the main branch of Eel. A guide? Twomey had the man at the barn long before sun-up. Perchance, he, too, ere this has crossed that other Big Divide toward which we all are faring. *Quien sabe?* If this be so, then may the sod rest lightly on him in his long sleep, for he was a gentle, wholesome, helpful man.

Seated in the store, smoking their pipes, the evening before packing-in to Trinity, Bob's attention was attracted by the appearance of a customer. The man's dress was the wonted garb of the region, and his purchase was a "bah'l of flou-ah," but that face surely never saw daylight in a southern cabin. "Was that an Indian?" asked Bob. "Divvil a bit," answered Twomey—"That's Charley Lee, the Chinese."

"But I thought you Humboldt people drove all the Chinamen out of the county in the 'seventies and allowed none to come in since?"

"Roight ye are, me bhoys! We done that same, but Charley stayed. It was this way—this is the way it was. Ages ago, long afore Oi kum across the plains to Oregon, Charley was settled in this valley. Shure, he was a pioneer in these parts! He'd married a squaw woman and was raisin' childer and vigoitoibles, as aisy an' plisint as ye please, down in the hook of Eel River. Whin the bhoys kum in, Charley treated thim whoite. Showed thim the best locations an' was handy-loike in gettin' of thim started. Thim kum the Injun raids, an' the sojers were no good—leastwise, the Sicketerry in Washington wouldn't lit thim kill nobody—just pacify thim. Wurrat! Those were bad days for us! Iv'ry mornin' most, Oi'd hear tell of some woman or childer or lone proshpector bein' massacred by thim burnin', murtherin' divvils. So we hilt town-maytins an' called for volunteers, an' whin we foinally rounded thim up and woiped thim out at Shelter Cove, Charley was with us an' he done a man's wourk that day, he did, so he did. Whin some of the bhoys corralled a preacher an' thought as it'd look kind of rayspechtale loike to 'rect a Baptis' choorch,

Charley Lee donated all the shakes for the fince an' slabs for the foundation—an' him knowin' no more about the Sacrimints than a suckin' pig knows of dhraw poker! Whin Yreka Jack was lynched, he at-tinded. That poor haythen was as chuck full of public spoorrit, bhoys, as any Christian whoite man in the county. Well, whin the toime kum for the maytin' to droive out the Choinese, Charley was there. Big Bill Spottiswood, ye reck'leck, him that was sheriff layther, presoided, an' he read the resoloush' that after the first of May no Choinese should raymain in Humboldt undher pinilty of dith, an' it pashed wid a rush. Thin up shtood Charley Lee, an' his face was as yellow as goold an' the tears dhript from him—ah, it was pitiful! 'Bhoys,' he sez, 'It's bither hard,' sez he; 'but majorhty rules. Oi've done lived here pretty much all me loif,' sez he; 'Oi know no other home or country. Whin Oi look about me,' he sez, 'ivry face here is the face of a frind,' he sez. 'Oi have no frinds on this here earth,' sez he, 'onless they're thim a-settin' here forntin me,' sez he. 'Bhoys,' sez he, 'Oi'll go, but whin Oi think of me poor ole woife,' sez he, an' me ten childer,' sez he, 'an' the three that's buried out in the sunny shpot in our little garhden,' sez he, 'whoy'—an' he bruck down intoirely. Up joumped Hank Griswold—ah, but he was a foine man! A foine man, he was, but a bit impoolsive loike. 'Shtop that!' he cried; 'Shtop that, Charley, else, by God, there'll be morthier an' suicide in this room this minnit! Bhoys,' he sez, 'What are we? Digger Injuns, savidges, would beasts, that we can ploy this rashal thrick on Charley here? Oi'd rather have Charley's yillow hoide an' the whoite man's heart that goes wid it, than be anyone of you pack of skoonks that voted for that resolush,' sez he, plumb dishmemberin' that he had voted for it hisself. 'Oi offer a 'mendment that the foregoin' don't nohow apply to Mr. Charles Lee of Alder Crick, seein' as how he's whoite clar thro', 'ceptin' his skin, an' if ary coyote in this here room wants to vote 'gin the 'mendment, let him dhraw whin he votes, for Oi shall shooly kill him!' Of 'course, iv'ryboddy voted 'Oi,' for we all loiked Charley; an' to tell the thruth, whin the resolush' was dhrawed, what wid bein' used to considherin' of him as wan of us, nobody guv heed that he was a Choinese."

A glorious, wild, free life they led, for one short week, in that herder's cabin on Long Ridge—glorious freedom for them, but solitary confinement for poor dog Rondo. As an old-timer put it: "When God made Trinity, He chucked things in anyhow; mostly end-wise!"—Endwise, they have remained. On the evening of their arrival, they turned the old hound loose; he immediately struck a scent; ran the deer through dense timber into a gulch so cavernous that no call or whistle could penetrate it; stuck to his quarry and returned late in the forenoon of the following day, foot-sore, but with tell-tale blood flecks on his chops and a clean hoof-cut on his fore-shoulder. Thenceforward, they still-hunted, in the mornings and evenings, and fished a little sometimes between hunts. They killed four bucks—all that they cared to kill; for neither of them has ever felt that it was right to take the life of a beautiful, harmless animal, just to convert 120 pounds of carcass into 7, or, at the outside, 8 pounds, of jerked venison. Dire need alone can justify the doing of this deed; and let him who does it wantonly, forfeit the honorable name of sportsman. Packing-out time came all too soon—and what a to-do they made over it! Marin's painfully elaborated diamond hitch proved to be a granny's knot and it worked loose, of course, on the most ticklish slide on the whole mountain, and venison, camp-kit, fishing tackle and their spare gun went sailing down into the gulch. Next, Bob essayed to tighten the hind mule's girth, whereupon that gentle beast reached around and nipped a succulent chunk from the region of his short-ribs. Packing is one of the fine arts and good packers are born, not made. Item: Eternal vigilance is the price of corporal entirety, when mules are about.

Once more the buckboard, lightened of all superfluous dunnage, for a quick homeward run. Once more the ever changing panorama of ridge, glade, canyon, forest, mountain; the brief noon rest; the starry, silent night; the halt for friendly chat with wayfarer bound northward; the pause at lonely cabin door to buy bread or wild-oat hay. For Rondo's sake they tarried a day at Rowe's station in Sherwood Valley, where the true old dog got his deer and Marin saw his first gacomixle—as has been told. Then Ukiah; a waiting train; and a total cash capital of \$2.35! "Wonder if he'll cash my check," mused Marin, dubious, as he faced the old Vermonter in his little bank. He cashed it. "This is scarcely banking, sir," said Marin, first pocketing the gold. "Young man, banking's mostly a knowledge of human nater. When two sech disreputable-lookin' ruffians as you be come inter this bank and says they're professional men from the city, I knows they're tellin' me the truth. Ef you had come in here lookin' peart and wearin' a stove-pipe, you wouldn't have got a red cent, without full identification. You boys has been off on a deer hunt. Used to hunt 'em myself when I was sprier." Truly is there a free-masonry in sportscraft! May its spirit flourish!

MARIN.

It is our sad duty to announce the appearance of one of the most colossal lies of recent years. The story which the man tells is this: He has a farm on the Missouri River bottom, near Elk Valley. A week ago the river began to rise, and he saw that his land would all be submerged. He transferred his family and also his stock and movable property to higher ground. There was on his farm, so he says, exactly two miles of barbed-wire fence. It was five-wire fence, and there were 32 bars to the rod, or a grand total of 102,400 bars. Yet this industrious liar and the hired man baited every one of these bars with a small bit of meat. They finished and escaped to the bluffs just as the water came up. For twenty-six hours the water remained five feet above the top of the fence. Then the river receded, and the man went down and examined his fence. He found, so he has the assurance to say, a fish hanging from every barb except three, or 102,397 in all. There were pickerel, bass, pike, suckers, and many other varieties. They averaged 10 pounds each in weight, giving him the astonishing total of 1,023,980 pounds of fresh fish. He discharged the hired man because he had not properly baited the three bars which failed to catch any fish.—Farm and Home.

Camping in Ontario.

I.—A Windy Day.

THE wind arose in the night; and, becoming very strong, it swept through the spruce pines of our island with a prolonged "s-s-s-s-swi-i-i-ish" which, though muffled to softness in the evergreen panoply, yet denoted force. This sound and the dashing of the spray against the rocks at the water's edge, were the noises that awakened me. Peering from the doorway of our creaking shack I saw that no light of dawn was visible; yet it seemed to me I could detect a grayer shade where the surface of the lake, my ears told me, was being churned into a white froth. When, after a seemingly long period, the morning light prevailed, the guide arose and started the breakfast fire, with much stamping of boots and cracking of wood in reassurance.

The wind swept in gusts around the shack, blowing the camp-fire smoke fiercely about, and playing with the flame as if it only wished the guide's fire was a real forest conflagration, or some such wilder and bigger playmate. Swift clouds pressed upon each other in a jumbled, free-for-all race across the sky; and at odd intervals bursts of light from the now risen sun shone through the interstices in the cloud panorama, causing the rugged, wind-furrowed surface of the lake to give out a weird, unusual glister, and calling especial notice to the white trimming upon the largest of the dark waves. The old, heavy, fire-formed Indian canoe which we had found and tied to our wharf, danced about almost as lightly as if it were in the Happy Hunting Grounds obeying the spirit paddle of the red man who created it from a tree of the forest. A half dozen gulls from the not far distant bay hovered and circled over the water, now battling against and now with set wings sailing in long graceful sweeps before the gale.

My companions and I plotted continually how the wind might be outwitted. Buoyancy was in our every thought; and each of us, before actually launching the canoe, tried his muscle successfully in an imaginary battle with the waves. Because the canoe is a frail bark there is a sprightly satisfaction in feeling it takes one lightly over a wave crest, and in having it bound forward in obedience to each dip of the paddle. We swept along at a leisurely pace in the stiller waters, and then, leaving the shelter of the last of the islands in the semi-circular chain that stretched part way across the lake, we met the full force of the wind with our paddles buried. At moments our canoe seemed to stand motionless, and we were almost unable to complete the strokes; but once under the shelter of the opposite shore, such wind as reached us served only to sweep us gracefully before it as it had the gulls.

We had set our minds this day upon a sheltered little lake we knew of, and for this bit of water, which must have appeared from the sky like a sleepy eye of the woods, we now pointed our canoes. Evidently our plan conflicted with those of a mother loon, for we saw the bird swimming about with her young as we entered the lake. Immediately the old bird took alarm. She dived quickly and reappeared at some distance, calling in a frightened tremolo for her offspring. As for that little towsie-headed fellow, he seemed to have little of his mother's fear, and allowed us to approach so closely that we decided to capture him; but lo! when we went nearer, the innocent appearing young rascal dived before our eyes and was gone. But after some seconds he reappeared behind us, where he calmly ruffled his young feathers in an old fashioned way.

Fishing upon a windy day from a canoe which rises and falls with the frequent swells, which swerves about at the mercy of each new gust of wind, and in which one must sit patiently and quietly in a cramped position, is an occupation which few persons would abandon with regret after three or four hours of it. Yet, to the zealous fisherman and canoeist, it has its fascination, too. The strike of a game bass upon a windy day comes always as a surprise. The fact that the intervals between strikes are long, and that the fisherman is unable to see anything below the roily, boiling surface—even the glint of the white belly of a fish that is suddenly upturned as it attempts to take the bait—makes each tug upon the line a period of strong recurring interest. And when, after a few moments of vigorous battle, the fisherman is able to draw a small-mouth bass to the restless surface, where the swells at one instant engulf it, so that the fisherman is fearful that the fish has thrown the hook, and at another instant reveal half of its shining body, so that he is immediately reassured and begins to gloat over his prize, while a companion holds the little scales in readiness to weigh the new arrival as soon as it shall have been successfully caught in the dip net, it seems that a veritable miracle has been performed. And immediately the wonder is how any fish could have found its way in all the confusion and turmoil of the water to the bait.

Our day, even in that partially sheltered lake, was wild and reckless enough to try our endurance; but it was sweetened with an occasional circumstance of the kind which is a fisherman's moment of triumph, so that our net, when we ceased fishing for less active diversion on shore, trailed quite low in the water.

We ate our luncheon near the buildings of a deserted lumber camp that we discovered. A dreary place it was! Gloomy and forsaken the buildings stood on the shore of a little arm of the lake, quite sheltered from the wind. The glare of the now brilliant sun made the shadows in the open doorways of the neglected cabins seem dark and dungeon-like. Peering within we perceived that certain of the narrow passageways between the tiers of rough, closely built bunks which lined the walls were strung with wires, upon some of which still hung discarded coats and trousers and heavy underwear, all appearing as if they had been put there at night time to dry, as no doubt they originally had been. At one doorway a furious hissing noise that sounded in our ears like nothing we had ever heard before caused us to step back in alarm. Concluding, upon second thought, that we had disturbed a nest of rattlesnakes, we armed ourselves with clubs and crept back for a glimpse of the reptiles. The hissing continued louder than before; but, as our eyes became accustomed to the darkness, we discovered that we had intruded only upon a colony of bats, for a number of the little creatures could be seen clinging to the walls; and now I knew how

uncanny had been that noise made by the evil soul of Procrustes, which "fled forth and went squeaking down to hades like a bat into the darkness of a cave."

We wandered a distance from the clearing into the woods, and stretched ourselves out at full length upon the ground near the summit and upon the sheltered side of a steep hill. By reaching out our hands we could almost touch the top branches of the pines that had their roots in the soil of the gully below; and between the upper branches of two of the trees we could look as through a window out upon the water of our sheltered lake.

How the wind droned through the forest behind us—suggesting sleep. If the woods are more lonely at one time than another, it is when the wind surges through them, for though the wind itself is company for a time, it is not unlike sweet music heard too long. Either it drowns out other sounds entirely or makes them sound distant and indistinct, always forcing its own monotonous presence in the ears until one is glad to shut them to the world and find a more animated presence in dreams. When the wind is high the finer voices of the woods are hushed. The twitterings, the love notes of the birds, are blown skyward as they are uttered, and even the penetrating call of the loon in northern woods seems to come from a great distance and to sound like a burst of Bacchanalian laughter that the wind is tossing riotously about, only now and then permitting a few notes to reach the earth. The wind, having snatched from one's very ears the pleasant sounds of the forest, seems to say in his conceit: "Here am I. Listen to me. Woo-oo-oo; woo-oo; woo-oo-oo."

Arousing ourselves finally from the stupor that was upon us, we explored the little plateau which stretched back from the top of our hill, plucking a few wild gooseberries that we found; and several times we came upon fresh evidences of deer, and it became plain, upon further investigation, that two or three of them had spent the night there. Perhaps, even at that moment, they were near at hand, for one may sometimes walk within a few rods of them and know nothing of their presence—such is the cunning of the deer, which has sense enough to save itself needless exertion when it perceives that it is not seen. Our pulses were quickened even by the thought that deer had been in that place the night previous, and by the thought that we were able to look out through the tree tops from one of their own retreats upon scenes which must have been their daily morning inspiration.

Warned at last by the waning sun, we launched our canoes with reluctance. When we entered the big open lake the wind swept upon us almost overwhelmingly, but by hugging the shore and landing frequently we crept campward, spurred by haunting visions of a supperless night in the woods. Yet there was pleasure in the struggle. Kneeling with our backs against the canoe's braces we looked straight upon every oncoming wave with thrills of joy and confidence. And our canoes rode each swell with a grace that belongs wholly to their kind, although one's prow rose now high out of the water and now seemed, for an instant, about to plunge beneath the surface. Our clothing, to be sure, was wet when we reached camp, and our appetites were keen; but we found the guide standing there before our home-like appearing shack waiting to put the finishing touches upon a bountiful supper. He smiled affably, and, pointing with a fork toward the reddening sunset, said: "Bad wind to-day. Good day to-morrow, maybe."

MILTON MARKS.

When I Am Gone.

WHEN I am gone whom would I have come round,
To make things cheerful near my grassy mound?

I'll tell you what would best
Become my place of rest:
Let my loved favorites of the field and air,
And circling forest, often visit there.

The lonesome turtle-dove
There call unto his love
At early morn, at noon or eventide,
Until his truant mate flies to his side.

The robin there be seen
Hopping o'er the green,
And stately field-lark sing his morning song,
And yellow-hammer, too, come lumb'ring long.

There from bush to bush
Should flit the gifted thrush,
Rich music make. The sweet-voiced catbird, too,
Should sing his love-song there the whole day through.

And in the tall trees near
One frequently should hear
The noisy blackbird calling to his mate
In early spring, at morn or evening late.

And there should sometimes come
And sit and beat his drum,
The gaudy woodpecker, as if he would
Awake to life the sleeper if he could.

And on some neighboring tree
A visitor should be
The old black crow, and, as he's wont to do,
Look round awhile and caw a time or two.

Then when the twilight comes,
And the whirring beetle hums,
I hope from out the wood the owl will fly,
And sound his doleful note near where I lie.

And slyly creeping out
From the stubble roundabout,
Bob White should come and perch and whistle there
In that lone place unto his lady fair.

The red-bird and the jay
I know will pick a day,
And from the thicket come to visit me,
And hop and fly about from tree to tree.

There one should often hear

That little creature queer,
The humming-bird, as busy as a bee,
Darting 'mongst the blooming shrubbery.

In gay and joyous spring,
The oriole should bring
His lady there to hang her nest on high
In some tall tree not far from where I lie.

And on a cloudy day
The chattering swallows, they,
When the rain is gone, should fly about my mot id,
Sailing swiftly low down near the ground.

And when the night is near,
The bull-bat should appear,
And fly around upon expansive wing
About the place where I am slumbering.

In snowy winter time
Should frequent there and climb
About the branches of the trees and sit
And pick the bark, sapsucker and tomtit.

And one should come there, too,
The little sparrow, who
Delights to flit around in playful rout,
Clinging to the weed-stalks roundabout.

When come the snow and sleet,
The snow-bird, too, should greet
The winter sparrow there, and there also
Pay his respects, the little Eskimo.

From early spring until
The frost is on the hill,
While other warblers wonder at his power,
The mockingbird should sing there hour by hour.

In summer time the shrike,
Upon a mullin-spike,
Should sit not far away and look as though
He'd lost a friend in him that lieth low.

And on the approach of night,
His solitary flight
The heron oft will bend o'er field and dell
To pass the place where I am resting well.

The rain-crow he should fly,
When it is hot and dry
In summer time, to some treetop that's green
And croak for rain to come refresh the scene.

When the moonlight's over all,
The whippoorwill should call,
Close by my grave his mate across the hill,
Or in the grove along the rippling rill.

If, then, when I am gone
None come to look upon
My grave but loved ones who bemoan my fall,
And these dear friends, what matters it at all?

F. A. McGUIRE.

MISSOURI.

Reforestation.

A paper by Chas. Cristadoro, of St. Paul, read before the American Forestry Congress, Minneapolis, Aug. 25, 1903.

LESS than ten years ago when one referred to forestry there was but a single stereotyped response: "What is forestry? What do you mean by it?"

The explanation that forestry in a broad sense meant firstly, the preservation of timber by intelligent and conservative lumbering, and, secondly, the perpetuation of the same through reforestation, brought forth a smile and oftener a loud laugh, and, strange to say, the man laughing loudest and longest was the one most interested—the lumberman himself.

But, "*tempora mutantur et nos mutamur in illis*," and certainly things are different to-day, for forestry has come to stay for all time, and is already recognized broadly throughout the land. Those who best understand its meaning deeply regret that it was not better appreciated twenty years ago.

But a few years ago some broad minded members of the Minnesota Federation of Women's Clubs visited the Chippewa Indian Reservation in northern Minnesota, and, after spending a few days in the vicinity of Cass and Leech lakes, as they turned their faces homeward, exclaimed: "Why cannot these beautiful forests be preserved for the people?" And suiting the action to the word they went about the work of preserving a part of these thousands of acres of crystal waters and virgin pines.

The history of their work can be written in a few words. Ridicule and opposition came from all directions, especially from some lumbermen and a few of those depending for their political welfare upon the campaign funds contributed by the lumbermen.

It was a long and stubborn fight. Appeals to the Legislature, to the Representatives of the State of Minnesota, to the public through the press, and to men of prominence, were made, but only to be met in most cases with scant consideration.

But the good work was pushed forward in the face of the fact that it was seemingly a crime in the eyes of the opposition to attempt to preserve a pine tree or to suggest the planting of one to replace the one cut down.

As one of our Representatives put it: "The forests have no other use than to be cut up into lumber, and the speedier it is done the better for all concerned." Certainly a case of "after us, the deluge!"

The fight was a bitter and stubborn one, but daily new friends of forestry were made and the cause of forestry grew apace.

One obstacle after another was overcome, and the opponents of tree preservation and reproduction laughed less and grew more and more concerned.

To ride roughshod over the sentiment that had been created was out of the question. It had come to a point where the opposition had to listen.

And finally the Morris bill, which gave to the people

for all time many thousands of acres of virgin pine, and in addition many more for the purposes of reforestation, was proposed and became a law. Thus will be perpetuated the name of one who bitterly fought the cause of forestry and reforestation in Minnesota from its inception.

Now that the wedge of forestry has been driven in we must go apace. Reforestation of cut-over and other wise unproductive lands should be the question of the day in Minnesota.

Where pine trees once grew they can be made to grow again. Soil that has once produced pine trees will sometimes grow nothing else. Heavily bouldered and stony land that once supported extensive forests of red or Norway pine can be made to produce its like again.

Unfortunately pine farming and wheat farming suggest varying temporal propositions. It takes eighty years to mature one crop and but a few months to produce the other.

And what will the pine farmer do and how will he raise the funds to meet his taxes annually while his crop is maturing? A Morgan, a Rockefeller and a Gould, we think, would balk on a proposition that meant a steady outlay for eighty years before a dividend was declared.

Therefore how can we have reforestation? The State might go into the pine raising industry, and it certainly would be a good investment for the State. And yet without going into the business itself it can help others who are willing to do so.

There are those who, if the taxes were waived by the State on their cut-over lands, might reforest them. To exact taxes on agriculturally worthless cut-over pine lands is to have them abandoned to the State to lie dormant and unproductive, a condition that carries no meaning of economy with it.

For years we have been told that our white pine stumpage was growing less and less, and in so many years it would be gone. We have heard it so often that it has been like the cry of "Wolf! Wolf!" Yet the white pine sun is fast setting beyond the horizon of Minnesota. Her days of magnificent cork pine trees are gone to return, let us hope, perhaps again to a limited extent, under reforestation.

The dismantled lumber mills along the greatest logging water way the world has ever known only too surely tell the tale. There are fewer mills running every year, and the cut is growing less and less.

The millions that have been made in the white pine forests of Michigan, Wisconsin, and Minnesota are to-day seeking investment among the giant firs, spruces and redwoods of the coast and among the cypress and yellow pine of the South. There are no more great solid bodies of white pine for sale within the former white pine belt.

That there is a crying need for reforestation within the States above mentioned cannot be questioned.

As an illustration of the advance in forestry, there are one hundred students following it up to-day as a profession and life work where there was one ten years ago.

The very men who only a short time ago smiled at the mere suggestion of forestry are to-day employing these selfsame visionary and theoretical foresters to tell them how to best handle their yet standing timber.

Forestry has not only come to stay, but to grow until the sentiment has reached that point when it will be considered a blunder not to plant a fresh pine aside the one just cut down. So may it be.

A Morning with the Squeteague.

Editor Forest and Stream:

Being on leave of absence revisiting the scenes of my boyhood, I received an invitation to visit a dear friend living in Providence; and, as an extra inducement, among other things, he said that we would go down the bay and fish for squeteague; he also said, "Be sure and bring Willie"—my son, aged fourteen. This friend, whom, for convenience, we will call the Doctor, is a prince of good fellows, bright, merry and generous almost to a fault. I had neither seen him nor his surroundings for ten long years, and I hastened to accept his invitation; and, profiting by Mr. Cristadoro's advice, I took "the boy along."

Omitting other details of the visit, I will commence the narrative of our trip down the bay after the squit. After an absence of ten years I was surprised to find how convenient and comfortable everything has become as regards travel, especially on short trips about New England. Electric cars have wholly reorganized local traffic. We left the Doctor's house one evening between 8 and 9 o'clock, neatly dressed, and carrying with us nothing but a basket of bait—live shrimp, dried and packed in sawdust. We might have caught the bait ourselves, if we had worked hard enough, but it seems that procuring bait is a greater undertaking than using it after it has been secured. The Doctor's professional duties would scarcely admit of his absence long enough both to catch and then use the bait; and as for Willie and myself, we were landlubbers from St. Louis, who, if sent for shrimp, would have known no better than to have gone to the nearest fancy grocery and purchased a can of Barataria shrimp—the kind that has a picture of a red lobster on the label. So the Doctor procured the bait from an expert; it was abundant and just what was needed. In addition to the bait we also carried a loaf of fresh bread. I have spent most of my hunting and fishing life on the plains of the West, when it was necessary, upon going out for a day or two's sport, not only to provide upon starting everything that could be needed for the entire trip, but also the mules and wagons wherewith to carry it; the Doctor's preparations consequently struck me as rather simple. I offered no suggestions, however, and awaited developments. We soon took an electric car that carried us swiftly to a point about ten miles down Narragansett Bay, called Oakland Beach. The car was spacious, comfortable and even elegant; one might almost suppose himself en route to a presidential inauguration instead of on a simple fishing trip. The only objection I can find with its service is the frequency with which the conductor came around and exacted nickels from the passengers. There is certainly room for improvement in this respect.

About 9:30 we got out at a little station with a miniature grocery beside it. We, that is, the Doctor, purchased a few potatoes, he then led the way in the dark across a field, and in a few moments we brought up at the clubhouse of the Oakland Beach Fishing Association. This clubhouse was a very small, unpretentious affair, but possessed the merit of having all that is ever required of it by the six members composing the club, and nothing else. In order to secure this desirable end, I doubt not, more real thought and care had been devoted to its arrangement than had been bestowed upon some larger and more pretentious affairs. Upon the Doctor's lighting up, we found ourselves in an unfinished frame room, about ten by fourteen, containing a small cook stove and furniture, table and chairs, well-filled cupboard and lockers, while on the ceiling joists above rested oars, rudders, rods, landing nets, gaffs and similar appliances; and still above, drawn up by neat little pulleys and cords, hung anchors, coils of rope, bait nets, fish bags and I know not what. Just off the main room opened two little alcoves, each containing a tier of two bunks well supplied with bedding, and a wardrobe fitted up with everything necessary to be worn while fishing, from rubber boots and slickers to old clothes and palm hats; so one had only to lay aside the neat dress worn down on the journey and put on one suitable to the occasion from the many at hand. A porch ran along the water side of the house; about six paces from the porch was Greenwich Bay, and between the two was a neat block of the proper size for dressing fish. Into the bay, for a short distance, projected a little boat pier, safely anchored beyond the pier were boats of various kinds, and a short distance behind the house commenced the cottages of the summer dwellers, where fresh water for the club is obtained. In order to gain a little time for the morning we got out our rods, jointed them, seated the reels and rigged the tackle; we then turned in. About this time a gentle rain commenced, and I don't know when I have been so pleasantly lulled to sleep as I was then by the patter on the low roof after our preparations were complete for fishing in the morning.

The Doctor's alarm clock summoned us at 4:30 the next day; we found the morning still and cloudy, but the rain had ceased. A fire was soon burning in the cook stove, and, while waiting for water to boil, the Doctor secured a boat from its anchorage, brought it alongside the pier, and bailed out the water from the last night's and previous rains, and we then placed in it our oars, tackle, bait, etc. We then made coffee and took a simple breakfast of bread and butter, corned beef and coffee with condensed milk, all of these stores except the bread coming from the lockers of the clubhouse. Breakfast over, we lost no time in embarking and getting under way. The boat was rigged for four oars, and Willie, having a great desire to learn to row, seized one pair while the Doctor took the other. The pull was two or three miles against the tide, and the boy picked up some idea of rowing, but, I fear, at the expense of the genial Doctor's, who had probably to furnish all the motive power and dodge Willie's oars besides. We reached the vicinity of the Black Buoy, and bailed up about six o'clock. The Doctor said that courtesy to his guests would not permit him to catch a fish till each of us had taken one, so he pottered about, showing us what to do and adjusting the boat, till soon Willie's reel burst forth into song. The Doctor gave the little fellow a few hints on managing his fish, and in course of time he had it alongside, and I laid down my rod and landed it with the net. It was a fine squeteague, and two to three pounds in weight, and lively enough on the hook. The little fellow had kept his wits about him, and had done very well with his first fish and felt a pardonable pride in its capture. While I was helping him to get his hook clear and baited again, my reel was set in motion with life, and in due season I landed my first squeteague.

For the information of unlearned readers like myself, I will explain that a squeteague or squit, a weakfish, and a sea trout are one and the same thing, squeteague being the old Indian name, the term weakfish being given doubtless on account of their mouths being easily torn out when hooked, and the term sea trout on account of a kind of lustrous marking, in appearance something like that of a trout, though they bear no relation to the family *Salmo*.

His guests having acquitted themselves fairly creditably, the Doctor set about fishing himself, and from then on till about nine o'clock business was good and we had about all the sport we could utilize. We used short Bristol bait rods with click reels; the tide running by kept our lines flat as we paid them out from the reel a little at a time with our hands, to something like forty feet; the click was of assistance when a fish was hooked, sometimes we further retarded his efforts by a regulated thumb pressure on the reel; our hooks were well baited with two or three live shrimp each. The fish bit well and we caught a fair proportion of them. It usually happened that we all three got bites about the same time, due, I suppose, to the fish passing in the vicinity of our boat in small groups. Almost every time I laid down my rod to help the boy land a fish, I would get a good one hooked on my own tackle; and all I would have to do would be to land him. This might be regarded as a reward for my paternal efforts to help my boy along, but I can't consider it very complimentary to my skill as a fisherman, the fish appearing to catch themselves better than I could catch them. The Doctor seemed to know all the arts for luring the fish to their destruction. He chummed them sometimes with bait and sometimes with sand, which he called economical bait; when they would no longer take the bait at the surface, he provided sinkers for our tackle, and we were soon catching them just as readily from a greater depth. In fact, while fishing with him, it seemed rather a simple thing to catch a good string of squeteague.

About 9 o'clock our interest began to flag, and the Doctor pulled up his anchor and told me to lift in the fish bag; we had kept this on the outside of the boat in the water so as to keep the fish alive and fresh, and as we have made no count while fishing, we had no accurate idea as to the number taken. I reached over, seized the sack, and endeavored to lift it into the boat,

but without avail; the Doctor then came to my assistance, and our united efforts succeeded in getting it out of the water and over the side—it must have weighed well on to a hundred pounds. We had observed a couple of other boats fishing in our vicinity, so we rowed over to the first one and asked, "What luck?" They had caught but one fish. We still had considerable bait left, which the Doctor bestowed upon them, receiving very grateful expressions in return. We asked them if they didn't want some fish. They admitted that they should like some but hesitated to accept any. The Doctor thereupon commenced throwing them one at a time into their boat and told them to stop him when they had enough. After the eighth had been thrown they declared they would not accept another one, so we rowed away, leaving three very grateful fishermen behind us.

We then pulled up to within hailing distance of the next boat and asked its occupants—a lady and gentleman—if they didn't want some fish. I suppose they misunderstood our motive, as the man replied rather stiffly that they preferred to catch their fish, or words of similar purport. We, nevertheless, pulled alongside their boat, and a glance showed that they had not only caught none at all, but had their tackle so fouled on their centerboard below the boat as to appear very doubtful about their getting it free again. We took three nice fish from our bag and tossed them over into the stranger's boat, telling them if they didn't want to keep them to throw them overboard, as they were still alive and would probably not be wasted. This was too much for them, and both occupants thanked us cordially and said they thought now their bad luck would change.

The algebraic resultant of the combined efforts of Willie and the Doctor at the oars finally brought us to the clubhouse. It was a good, long pull under any circumstances, and I fear it was somewhat lengthened by the boy's nautical ambition. The Doctor, however, was game, he insisted on the boy's being permitted to row, and protested against my spelling him at the oars; but he, nevertheless, looked relieved when he was finally at the house. As soon as we got the boat and tackle cleaned up and put away, we pitched in and dressed the fish nicely and packed them for the trip home. A count showed us still with thirty nice ones in our possession, thus giving us forty-one for the morning's score. We now re-kindled our fire, selected the smallest of our fish, and cooked a dinner fit for sportsmen, and then sat down and did justice to it.

While we were dressing our fish, a cat, belonging to a solitary resident of a nearby cottage, came up to where we were at work and annoyed us considerably by constantly reaching up and clawing us. We put her away gently a few times, but it did no good. Finally the Doctor picked her up and tossed her a considerable distance to his rear. He didn't hurt her any, but she unluckily fell into the briny deep and got pretty wet. When she came out she rolled in the sand, and, between the sand and the water together, she was an unusual object to behold. Unfortunately for the harmony of the camp, her owner appeared about that time, and, seeing his pet in so bedraggled a condition, inferred, I suppose, that we had endeavored to do him an injury, and at once opened a debate with us upon the subject. It developed, during the conversation that followed, that the Doctor is as good at talking as he is at fishing, and the other party withdrew from the scene. This detail has but little to do with the fishing, and I mention it merely on account of the amusement it afforded the junior member of our party. Boys seem to love a quarrel, and I doubt not to Willie this was by far the most pleasant part of the trip.

After dinner we cleaned up everything and put it away nicely in its place, dressed ourselves for the city again, locked the clubhouse, and, taking our burden of fish, wended our way across the field to the electric station, and were glad enough when we reached it. We reached home about 1 P. M., tired and happy, and spent the remainder of the afternoon in remembering grateful friends.

WM. F. FLYNN.

WOODSTOCK, Conn., Aug. 20.

The Zebra vs. the Mule.

RICHARD GUNTHER, Consul-General at Frankfort, writes: German papers say the mule will probably be replaced in the twentieth century by a more efficient animal, as it has been demonstrated that the mule, the cross between horse and donkey, is inferior to the cross between horse and zebra.

Formerly the opinion prevailed that the zebra was almost extinct. The opening up of Africa, particularly the eastern part, reveals these fine animals in large numbers.

Compared with horses and cattle, they possess peculiar advantages, as they are immune against the very dangerous horse disease of Africa and also against the deadly "tsetse" fly. The question was, therefore, raised whether the zebra could not take the place of the mule, commonly used in the Tropics. The greatest credit with reference to the solution of this problem is due to Prof. Cossar Ewart, who has been trying since 1895 to produce crosses between horses and zebras, with a view to developing an animal superior in every respect to the mule.

Three species of zebras still exist in Africa: the so-called "Grevy" zebra, on the high plateaus of Schoa; the common or mountain zebra, formerly found everywhere in South Africa; and the "Burchell" zebra, still frequently found.

Prof. Ewart produced crosses from mares of different breeds and zebra stallions of the Burchell kind. The offspring is called zebrula, and on account of its form and general bodily condition—especially the hardness of the hoofs—is specially adapted for all transport work heretofore performed by mules. The zebrula is much livelier than the mule and at least as intelligent.

The Indian Government has already experimented with zebrulas for transporting mountain artillery at Quetta.

In Germany much interest in this animal is manifested. The well-known Hagenbeck is experimenting

in this direction and intends to introduce the zebrula into Germany and America. The zoological garden at Berlin possesses some very fine specimens. The zebra stripes are often well preserved, while the undertone of the skin is generally that of the mother. A full-grown zebrula is 14 hands high and the girdle circumference about 160 centimeters (63 inches).

The experiments so far have been so successful that it is predicted that the zebrula during the present century will completely supersede the mule.

The Monkeys Counted to Three.

BUT as regards animals being able to count, a case once came under my notice where it was proved that monkeys could count up to three, but no further. A Colonel Bowker, one of Natal's most enlightened and enthusiastic naturalists, was once staying at an hotel near Durban, close to which was an oblong patch cleared in the bush and planted with mealies, which were ripe, the stalks being higher than a man's head. Monkeys were annoying the proprietor by making excursions from the bush into the field, and throwing down about fifty times as many cobs as they tackled internally. Colonel Bowker, who firmly believed that moneys could only count up to a certain number, took three friends with him into the field with guns, openly. Naturally the monkeys were not taking any lead just then. But shortly one man walked out with his gun over his shoulder, and made straight for the hotel; a second did ditto; and then a third. Then the monkeys went for that mealie patch, with, of course, the inevitable result, that some of them did not leave it!

—The Asian.

Rhode Island Agricultural Report.

PART II. of the Fifteenth Annual Report of the Rhode Island Agricultural Experiment Station, covering the years 1901-1902, shows the work done at this station in the line of horticultural investigation; and, under the Biological Division, in the investigation of various problems which have to do with poultry. Rhode Island has long been a poultry State—celebrated especially for its turkeys—but within the past few years these fowls have been attacked by various diseases which are as yet little understood. If the investigations of the Biological Survey should succeed in discovering the causes of these diseases and their remedies, it will have performed great service not only for Rhode Island, but for other States.

Natural History.

Our Batrachians and Reptiles.—VII.

AMONG vertebrated animals the *Testudinata* or turtles are as readily recognized by their shell-covered bodies and toothless, horn-covered jaws as the birds are by their feathers or the mammals by their hair. As inhabitants of the fresh waters of streams, ponds, and lakes, as well as the dry land and the coasts of the oceans and bays, they are common enough in most parts of our country to be well known to every one. Even in the larger cities they are frequently seen, for they are sent to market in great quantities. In fact, the demand for some species has become so great that they are being rapidly exterminated, and they are really more easily found in some of the larger markets than they are in their native haunts.

As has just been remarked, the most distinctive characteristic of the turtles is the shell, but as the reader is probably aware, this is subject to a great deal of variation. In all cases it covers the body both above and below, the upper portion (carapace) and the under portion (plastron) being united at the sides so as to leave, in front and behind, wide apertures through which the limbs, head and tail are extended.

In the great majority of turtles the shell is composed of bone overlaid with plates of horny material. The bony framework of the carapace consists of the dorsal vertebrae, the much expanded ribs and a number of dermal ossifications around the margin. The plastron consists of the modified clavicles and a few dermal ossifications. Upon the bone is a layer of skin containing blood vessels and upon this rest the horny plates. Of the latter there are in the carapace three rows of large plates, the median row being known as the vertebrals, and the lateral ones as the costals, and a marginal row of small plates called the marginals. On the plastron there are two rows of plates, and on the bridge which connects the plastron and carapace are a few others.

In the leatherback turtles of the ocean and the soft-shell turtles of the fresh waters the shell is leathery and flexible, and is not covered with horny plates. The underlying bony framework of the soft-shell turtles is very much like that of the hard-shelled turtles, but in the leatherback the ribs and backbone do not enter into the structure of the carapace, and to compensate for the deficiency there is a sort of mosaic of small polygonal pieces of bone forming a false roof over the rest of the skeleton.

Unfortunately there is no set of common names which can be applied with any degree of certainty to the three groups indicated in the preceding paragraphs. It is generally supposed that turtles, tortoises, and terrapins differ in some way from each other, and some of our dictionaries have attempted to show to which group each name should be applied. The name tortoise has been limited to the terrestrial forms, turtle to the aquatic species, and terrapin to those which are semi-aquatic, but both in popular and scientific literature as well as in common parlance the distinction has never been observed. The name tortoise comes from an old French word meaning twisted and alludes to the crooked, club-like legs of the common land tortoise of Europe. Turtle is probably a corruption of tortoise. Terrapin is apparently an American Indian word, and probably was first applied to the species now known as the diamond-back terrapin.

By whatever name they are known, our turtles or tortoises or terrapins are an exceedingly interesting group of animals, and deserve far more attention than is generally given to them. They are a difficult group to study, and there are not many collections complete enough to be

attractive to the few scientists who are interested in them. The last general work on our American turtles was written by Prof. Agassiz, of Harvard University, and was published over forty years ago. Since that time our knowledge of these creatures has increased considerably, but as yet no one has placed it within reach of the beginner.

By most zoologists the following three groups or sub-orders are recognized in the *Testudinata*:

1. The *Atheca*, including the leatherback turtle.
2. The *Thecophora*, including all the hard-shelled turtles.
3. The *Trionychia*, including the soft-shelled turtles.

So far as is known, the first sub-order has but a single living representative, the great leatherback turtle (*Dermatochelys coriacea*). It is apparently an inhabitant of the high seas, coming to the land only to lay its eggs. During the breeding season it is said to be not uncommon on some of the West Indies, but along our own coasts it is very rare, and is seldom captured. It is of no commercial value, and its large size leads the fisherman who finds a stray individual in his nets to liberate it rather than take the trouble to send it to some museum. The total length of a full grown specimen may be as much as eight feet and the weight over a ton. The species may be recognized at once by the leathery shell, by the limbs which are developed as flippers instead of feet for walking, and by the strongly ridged shell, the carapace having seven large longitudinal ridges and the plastron five. The shell is shield shaped, rounded in front and pointed behind, and in life is said to be mottled with black and yellow. Other common names for this animal are luth, trunk turtle, trunk back, and lyre turtle, the latter name having reference to the myth that the shell of one of these turtles was used by Mercury in the construction of his lyre.

In the suborder *Thecophora*, about two hundred and fifty species of turtles are included, and these are divided into nine or ten families. In the United States there are about fifty species representing five of the nine families. As stated before, all of these turtles have solid shells covered with plates of horn. In all the families which occur within our limits the head can be withdrawn into the shell and when in this position the neck is bent into a vertical S-shaped curve, thus contrasting with certain families of turtles found in other parts of the world in which the neck bends sideways, the S-shaped curve being horizontal.

In giving English names to the families of turtles which occur in North America we are again beset with difficulty, for in different parts of the country the same turtles will be found to have entirely different names, the name mud turtle, for example, being applied in some places to the snapping turtles, and in others to any turtle which happens to live in muddy places. With a little care, however, the following list can be understood:

1. The sea turtles, family *Cheloniidae*.
2. The snapping turtles, family *Chelydridae*.
3. The mud turtles, family *Kinosternidae*.
4. The pond turtles, family *Emydidae*.
5. The land turtles, family *Testudinidae*.

The sea turtles may be instantly recognized by their oar-like flippers in which there is no external trace of toes, except one or two nails or claws. The carapace is shield-shaped, rounded in front and pointed behind, broad

Fig. 1.—The Tortoise-Shell Turtle.

and flat and highest near the head. The common representatives of this group are the loggerhead turtle, the hawksbill turtle or tortoise-shell turtle, and the green turtle. The first and last of these may be known by the thin plates of the carapace which do not overlap to any great extent, in contrast with the second, in which the plates are thick and on the carapace overlap like the shingles on a roof. The loggerhead may be known by the very large and heavy head and the fact that the lower jaw has a smooth cutting edge. The tortoise shell turtle furnishes the tortoise shell of commerce; the other two, and especially the green turtle, are much used for food.

The family *Chelydridae* is represented by two species, the common snapping turtle and the alligator snapping turtle. The former is distributed from the Canadian lakes east of the Rocky Mountains, through the United States to Central or South America; the latter occurs in the basin of the Mississippi River as far north as southern Indiana. Both are large and repulsive looking beasts, with comparatively small shells, large heads and long tails. They may be easily known by the fact that the tail is about as long as the shell. They are savage in disposition, and their unusually strong jaws are efficient weapons of offense and defense. When attacked they usually make little effort to retreat, but rear themselves high on their legs and lunge forward, closing the jaws with a snap.

The common snapping turtle or snapper (*Chelydra serpentina*) is so well known as to require no description. Probably every boy and man who has lived near the coast or any fresh water has participated in the capture of one of these animals, and is well aware of its viciousness. The tenacity with which it will hang on to an object that it has bitten is also well known, but that it will not let go until there is thunder is a saying for which the author hesitates to vouch. The alligator snapper, apparently a rather uncommon animal, looks very much like its more abundant relative, but reaches a much larger size, and has a much larger and stronger head. In the United States National Museum there is a specimen of this species, said to be the largest on record, which measures 5 feet 4 inches in length, and which weighed 155 pounds. In speaking of the alligator snapper, Prof.

Fig. 2.—The Snapping Turtle (*Chelydra serpentina*).

Agassiz says: "They are as ferocious as the wildest beasts of prey, but the slowness of their motions, their inability to repeat the attack immediately, their awkwardness in attempting to recover their balance when they have missed their object, their haggard look, and the hideous appearance of their gaping mouth, constitute at such times a picture as ludicrous as it is fearful and revolting. Their strength is truly wonderful. I have seen a large specimen bite off a piece of plank more than an inch thick. They take hold of a stick with such tenacity that they may be carried for a considerable distance suspended to it free above the ground. Fishes and young ducks are their ordinary prey. They lay from twenty to forty or more round eggs only about the size of a small walnut, in holes which they dig in sloping banks not far from the water."

The mud turtle, family *Kinosternidae*, as regards size, stand at the opposite extreme from the snapping turtles, none of the three or four species attaining a length of over six inches. In all the mud turtles the carapace is rather narrow and high, the outline usually rising toward the back of the shell so that the bulk of the body is behind the middle. In the genus *Kinosternon* the front and back of the plastron are movable on the middle portion so that the shell can be closed. In the genus *Aromochelys*, which contains the turtles commonly known as stink pots or skill pots, from their disagreeable odor, the shell cannot be so closed. In both genera there are twenty-three small plates around the margin of the cara-

banks. These hatch in six or seven weeks, and the young go at once into the water. The growth is very uniform for the first few years, but later becomes rather irregular. In any case it is very slow, a specimen twenty-five years old and still growing measuring only five inches in length. The age in this species, and in most others as well, may be determined roughly by counting the concentric ridges on the plates of the carapace, but with advancing age these become indistinct, and at length disappear. For the winter the painted turtle digs a hole in the bank or buries itself in the mud at the bottom of the water and remains in hibernation until spring is well advanced. It is stated that this turtle, like some others, has a voice, a shrill chirp, which is uttered during the breeding season, probably to attract a mate. In the Mississippi Valley and further to the westward the painted turtle is represented by other species of the genus *Chrysemys*, which differ from it in the arrangement of the plates on the shell, the proportions, and colors, but which are essentially like it in habits.

In the salt marshes along the sea shore from Buzzard's Bay to southern Texas the famous diamond-back terrapin is found. It was formerly extremely abundant in the Chesapeake Bay, and Chesapeake terrapin, as they were commonly called, set the price in all the eastern markets, but the persistent pursuit of the animals and the barbarous method of catching and imprisoning the females has nearly exterminated the native diamond-backs, and the Chesapeake Bay supply is kept up by importations from the south. A terrapin farm, if properly conducted,

Fig. 4.—The Soft Shell Turtle (*Aspiderochelys spinifer*).

could probably be made a very profitable investment, for in captivity the females produce eggs in abundance, and the eggs hatch without difficulty. The care of the young is the only serious problem apparently, for if put back into the water with the adults they are never seen again.

Another extremely interesting group belonging to this family are the box turtles, belonging to the genus *Terrapin*, some three or four species of which inhabit the eastern half of the United States. They are strictly terrestrial in their habits, and are usually found crawling slowly about in the forests, in some places so abundantly that five or six can be captured during a short walk. They make very amusing pets, for they quickly become accustomed to captivity, and their actions are droll and ridiculous in their stateliness. The ordinary diet of the box turtles seems to consist of vegetable matter, succulent shoots of plants, fruits, and similar things, but when hunger presses they will eat insects, snails, and earthworms. They are inoffensive beasts, never offering to bite. When danger threatens they draw back into their shells, and, so to speak, close the door, for both the front and hind lobes of the plastron are movable on a fleshy hinge across the middle and can be drawn up so as to seal the opening very tightly. Although there are well authenticated records of box turtles which have lived nearly a hundred years, they have some enemies which destroy them in great numbers. The young are eaten by birds and foxes, and the adults are devoured by stronger animals, which can either crush their shells or drag out their flesh. Probably the greatest destructive agent is forest fires, the path of which is often marked by scores of whitened shells of these animals.

The family *Testudinidae* is represented in the pine barrens of the Southern States by one species (*Gopherus polyphemus*) which is commonly known there as the gopher turtle. The name alludes to its habit of burrowing in the ground, its long tunnels in favorable localities honeycombing the earth. The species lives to a great age, and reaches a length of fifteen inches. So far as is known they never enter the water. Eggs to the number of five or six are deposited by the female in a hole which she digs near the nest, and the young are left to care for themselves.

The soft-shell turtles belonging to the sub-order *Trionychia* may be recognized instantly by their flat, disk-like form and their naked, soft shells. The neck is long and slender. The head is narrow and ends in a pig-like snout, and the feet are strong and broadly webbed. The five or six species which inhabit the United States are found in streams from the Great Lakes southward to Louisiana and Texas. In the Mississippi Valley they are very common, and again in the streams of the Southern States which empty into the Gulf of Mexico and the Atlantic Ocean, but from the Savannah River north to the Mohawk they are not found in the Atlantic drainage. By nature they are eminently fitted for an aquatic life,

and they spend nearly the whole time in the water, where they can swim with great rapidity and find their proper food of mollusks and fishes. During warm days, however, they delight in a sun bath, and may be seen resting on logs and stones above the water. In the breeding season the female sometimes travels quite a distance on land to find a suitable position for a nest. The eggs, to the number of about twenty, are laid in holes in the sand, and on hatching the young go at once into the water.

In spite of the small size of the head, the soft-shell turtles have strong jaws which they do not hesitate to use when they are carelessly handled, and a bite from a specimen eighteen or twenty inches long would not be a laughing matter. Whenever it is possible, however, they make their escape, and even on the land can move with considerable speed. In some places they are eaten, and by those who are qualified to judge in such matters they are pronounced as equal to the best of the more highly prized food turtles.

W. P. HAY.

Birds and the Fruit Grower.

THE Rural New Yorker gives these observations and opinions on the birds and fruit question, as drawn from the experience of 1903 on the Rural's Grounds:

As the earliest strawberries paled and flushed to ripeness the robins and catbirds descended in force, selecting, as usual, the best fruits first, but later became so numerous as seriously to reduce all marketable sizes. Close covering was needed to save fair samples of certain new trial varieties. Juneberries and early cherries came next. There was a splendid crop of the former of both tree and bush kinds. The cherries were comparatively scarce, but just as acceptable to the birds. Not a ripe fruit of either species was secured except where bagged or netted for seed saving. Currants and gooseberries followed as a side issue, the destruction of the red varieties being almost complete before sufficiently ripened for use.

In previous years the fruit-eating birds have scattered as the later strawberries and cherries came on. The demand for insect food to raise the second crop of nestlings has always before saved the bramble berries from serious depredations, but this season there was only a brief intermission as the blackcap and early red raspberries colored up. The usual toll of choice fruits taken from these varieties was not grudged, as good pickings could be had by getting out early in the morning. Before the crop was gathered, however, the birds came back, bringing their families of fledglings, together with a great concourse of relatives and friends, and made short work of the remaining raspberries, a fine lot of dewberries and all the blackberries and wineberries to date. Not a berry is allowed to get to the edible stage from the human standpoint, but is promptly snatched off. Where pickings of 15 to 25 quarts should be had daily, not a good ripe fruit can be found. Since the days we explored "pokeberry clearings" in the Pennsylvania timber forests we have never seen such a persistent and clamorous gathering of berry eaters.

Grapes and apples have not yet reached a stage inviting to the birds, but we are concerned lest they may be attacked in due course. There are practically no peaches, pears or plums this year to succeed the berries. The only fruits so far ignored by the feathered pirates are mulberries, strawberry-raspberries, and the elæagnus fruits, all of which were in good quantity. The failure of the usual crop of roadside cherries and the local clearing up of waste lands and bramble thickets may account in part for the unusual destructiveness of the birds this particular season, but each successive year brings a noticeable increase in the birds infesting fruit gardens, until we may conservatively say that robins and catbirds not only form a greater menace to horticulture than the European sparrow, but are likely to cause more loss to the grower in the long run than the vagaries of our climate, insect pests and fungus diseases combined, as our present experience shows that they are capable of appropriating the entire crop before full maturity instead of a reasonable fraction, as is so often urged.

The Audubon Society and associated bird lovers have done grand work in furthering the legal protection of all harmless birds, but have gone too far in taking away the inherent right of the gardener to protect his crop from species having natural or acquired predatory traits. It is now a serious infraction of the law to kill or destroy the nests of robins, catbirds, thrushes, cedarbirds and other destructive birds in almost every State of the Union under any circumstances, and the fruit grower has absolutely no legal means of defense that is at all practicable. He should be allowed at least to rid his fruit garden of individual pests that prey on his products. It is not pleasant to think of killing birds, but in some localities they must be thinned if fruit is to be grown at all. To shoot robins or wildcats for the mere lust of slaughter is alike reprehensible in schoolboy or President, but we may be compelled in self-defense to war on unduly protected destructive birds as we do on potato beetles and codling moths. The trouble is due to misinformation regarding the life history of these birds under our present conditions of semi-domestication. The European sparrow has ceased to become especially troublesome in most places since the mantles of sentiment and protection have been withdrawn, and he may be dealt with according to discretion. The gardening fraternity has generally a kindly feeling toward bird life, and may be trusted to distinguish real friends from enemies as they come under daily observation among cultivated crops.

Many instances are recorded of alterations in the habits of native birds as affected by the rapid and dense settlement of localities. Species that were formerly able to glean their living in woodlands and pastures, often with apparent benefit to the farmer, have become annoying inhabitants of the orchard and garden, and seem disposed further to curtail their insect diet in favor of the fruits now so abundantly cultivated. It is rare in this locality to see a robin at work in the meadows in the old way, but in the fruit garden they gather in coveys. The catbird always was a sly and cunning thief, but the schoolboy prejudice against his peculiar cry quite effectually suppressed undue increase. He is graceful in

Fig. 3.—The Painted Turtle (*Chrysemys picta*).

pace, as against twenty-five in the families which follow. They are said by Agassiz to lay from three to five eggs in holes dug near the water's edge.

In the family *Emydidæ*, to which the name pond turtles has been given, there may be found an almost unbroken series leading from species which are strictly aquatic to others which are as strictly terrestrial in their habits. In the aquatic species the feet are broadly webbed and paddle-like, but in the terrestrial species they are hardly at all webbed, and are fitted for progression on land only. In all the species there are twenty-five plates around the margin of the carapace, and there are twelve plates on the plastron. A very common representative of this family in the eastern portion of the United States is the painted turtle, *Chrysemys picta*. It is an aquatic animal with a comparatively flat carapace very prettily marked with dark green, yellow, and red. It is most often seen perched on some log or stone above the water where it can enjoy the warmth of the sun, but never so far away that it cannot plunge instantly into the safe retreat on the approach of danger. Their food consists of insects, fish, frogs or worms; in fact, almost any animal diet which it can capture. The species lays about seven eggs less than three-fourths of an inch long in holes which it digs in the

form and a most agreeable vocalist when not caterwauling, but his appetite for choice cultivated berries is insistent and continuous. A pair or two about a farmhouse may well be tolerated, but their indefinite increase is to be deplored. The brown thrush is a delightful songster and an inveterate berry eater. He comes to the garden early and stays late, while his capacity for appropriating the finest fruits almost passes comprehension. He is, however, wary in nesting habits, and is not likely to increase with undue rapidity like the robins and catbirds.

The species thus far enumerated all consume insects when fruit is not to be had, and are especially active when feeding their young. In moderate numbers they will be tolerated in the future as in the past, but if the first two increase at the present rate they will put an end to fruit growing in many places. The golden-winged woodpecker or highholder—the “dicker” of Pennsylvania woodlands—seems to be an exception in resisting the modifying influences of civilization. These large and handsome woodpeckers were formerly much hunted for food, as the flesh of the young is of tolerable quality, but since the enforcement of protective bird laws they have become more numerous and confiding. They are fond of fruits, especially cherries, and will make an astonishing number of visits daily to favorite trees when in fruit, but do not forget their appetite for insects at the same time, as they may be constantly seen on the ground digging out grubs with a few strokes of their sturdy bills, from the toughest sod or baked hardpan by the roadside, as well as hammering out borers from the decaying limbs of trees. The robin, on the other hand, camps right out in your berry patch and stays as long as the fruit lasts. When he goes there is little left for the grower.

The Rural New Yorker would like definite information as to whether birds are generally more destructive to fruits this season than before. Much has been printed in former years about this really important matter, and the consensus of opinion seemed to be that certain of our native birds were learning new tricks of destruction, and were becoming serious pests of the fruit grower. Doubtless our statements will be criticised as a great outcry over the loss of a few hundred quarts of berries, but if the Rural Grounds' experience is duplicated all over the country or even in a considerable number of places, it may show the necessity of demanding legislation that will enable a grower effectually to protect his crops.

The Nest of the Lamprey Eel.

MEMBERS of the United States Fish Commission are very much interested at present in the two entirely new and curious developments of ichthyological life which have been quite recently brought to their attention. Several days ago the official in charge of the Government fish hatchery handed in his report for the month of May, to Mr. Titcomb, the official who attends to the distribution of fish about over the United States, and must be kept posted as to the progress of work at the hatcheries. In reading over this report, Mr. Titcomb was struck with the following that he had copies of it typewritten and sent to other members of the commission, as well as to leading ichthyologists throughout the country. In the following extract from the report mentioned, the chief of the Government fish hatchery describes, for the first time, the manner in which the lamprey eel builds and protects its nest, all of which he observed himself. He says:

"On May 19, a pair of lamprey eels were seen spawning in rather swift water above the rack. The larger of the pair, supposed to be a male, was probably 18 inches long, the smaller about 14 inches. Another small male was seen hovering around the nest. The nest was cleaned of sediment and gravel by fanning with their tails, at the same time holding themselves in place by fastening on to larger rocks with their suckers. When they encountered stones too large to be removed by fanning, they would fasten to them with their suckers and pull them down stream out of the way. If the stone was too large for one, they would both take hold of it, and by pulling together they would remove it. At one time they encountered a stone that was too large for the pair, when the smaller male, that was loitering around the nest, came to their assistance, and the three removed it. In pulling the stones they worked together, and never made the mistake of pulling in opposite directions. If the stones were not large they would frequently push them across the current and out of the way. I saw them remove stones as large as the bowl of a pint dipper, and that must have weighed over two pounds. After the nest was completed the female proceeded to deposit her eggs, and, after spawning, the eggs were covered by fanning fine silt and sand over them, the same as when cleaning the nest. The eggs were so small they could not be seen with the naked eye."

The other new development is equally interesting. Until the present year, the fish commission never succeeded in raising brook, speckled, rainbow, Scotch and steel-head trout, landlocked, British and Atlantic salmon in the glass display tanks of the museum and aquarium, which occupies the entire first floor of the Commission building. These fine food fishes, accustomed to clear and cold waters, were unable to survive the summers of this latitude, so that when warm weather arrived they either died or were shipped back to the stations in New England, the great lakes, the Rocky Mountains, or the mountains of North Carolina, and replaced with common bass, crappie, eels, English tench, golden ide, catfish, carp, buffalo fish, gold fish and other fish able to stand hot weather and warm water. This summer, however, visitors to the commission's museum and aquarium have been astonished over seeing all these cold water fishes in the very pink of condition, and have wondered how the commission managed to thus keep fish that can only live in cold water enough to give one swimming in it instant cramps.

The manner in which this was accomplished, however, was simple enough. Last winter the commission installed an ice plant in the basement of their build-

ing, and constructed a reservoir in the yard back of the building. A series of pipes, connecting the reservoir, ice plant, and display tanks were then installed, so that it is now possible to pump the water from the reservoir into the ice plant, cool it down to a temperature of 50 degrees, and pipe it into the display tanks containing the trout and salmon. If this water were allowed to remain in the display tanks for so much, even, as 30 minutes, it would turn warm, and to maintain it at the temperature above mentioned, it is led off immediately through a system of pipes back to the reservoir. Thus the same water is used over and over, continuously. Of course, the different species of salmon and trout come from widely separated sections, and some are used to colder waters than others, but it is impossible for the commission to prepare the water at different temperatures for each, and so 50 degrees has been adopted as coming nearer to suiting all species than any other temperature. The effect is at once noticeable in the condition of the fish. The brook trout, indigenous to New England, where the temperature of the brook waters is rarely above 50 degrees, are in fine condition. The rainbow trout, which thrive best in the mountains of Tennessee, North Carolina, Kentucky, West Virginia and Pennsylvania, are also looking well, although the water is a trifle too cool for them, while the Atlantic and landlocked salmon and Scotch trout, accustomed to the cold waters of Maine, New Brunswick, Labrador and Scotland, are not doing so well.

One of the new and attractive varieties of trout is the steel-head variety, from the north Pacific coast. This fish has been introduced by the commission into Lake Superior and Lake Michigan, where they have multiplied at an astounding rate, and reach an enormous size.—Washington Post.

Canadian Birds.

It is more than three years since the first part of the catalogue of Canadian Birds, by John Macoun, naturalist of the Geological Survey of Canada, was printed. Part II. has just been issued, and its preface bears date April 22, 1903. It includes the birds of prey, woodpeckers, flycatchers, crows, jays, and blackbirds. The volume is one of about 200 pages, and enumerates almost 200 species of birds, besides a great many sub-specific or varietal forms; for example, six forms of shore lark, four of red-winged blackbird, and four of Canada jay were observed.

The work is what it purports to be, a catalogue of Canadian birds. But it is more than that, being very fully annotated and containing a vast amount of interesting information, gathered not only by the naturalists attached to the Geological Survey, but by other observers as well. The catalogue includes the bird's English and its scientific name, and the date when the latter was given; a few lines as to the distribution of the species, quoting authorities; a more or less full account of its breeding habits, and finally a list of the museum specimens, published by the Survey. The plan of the catalogue is thus excellent, and it contains a very great deal of information in an astonishingly compact form. Prof. Macoun and his assistant, Mr. Spreadborough, as well as Mr. J. M. Macoun, naturalist to the Boundary Commission, deserve great credit for their industry.

There is strong temptation to quote freely from this interesting book, for on almost every page there is a bit of natural history that is worth referring to. We may at least speak of the occurrence of the California vulture in British Columbia, of the black vulture near Quebec, and of the silver-tailed flycatcher as far north as Manitoba, and even York Factory on Hudson Bay. If none of these occurrences are here announced for the first time, they nevertheless remain extremely interesting. Every bird lover should have this catalogue.

The Happy Hunting Grounds.

Editor Forest and Stream:

In your issue of Aug. 15 your intelligent correspondent, A. H. Gouraud, attributes to Mr. Hallock the suggestion that animals may enjoy an after life, and then proceeds to question the probability of such an hypothesis. I suppose this was inadvertence on his part, because the supposition is as old as the hills, and I simply introduced a comment upon the Scripture quotation (Ps. 30:7) which reads: "Thou, oh Lord, shalt save both man and beast."

In this connection, won't the editor do me the kindness to reprint a paragraph from your issue of July 25, which applies here? though with the main object to correct an unfortunate misprint in the text, where the word "inanimate" is substituted for the word incarnate, making nonsense? I wrote: "Indian folk lore teaches that animals are not lower than man, but different in mental organism and caliber, as well as in physical structure, speaking a different language, and having different viewpoints. The souls of their deceased ancestors are believed to be incarnate [not inanimate] in the animals they hunt, and they treat them always with profound respect; as the Siberians do their reindeer, never killing one without first apologizing. Indians wear the symbols of bear, wolf, beaver as totems from infancy, * * * allotting to them a future place in the immortal life."

If the very ancient belief in an after life for animals, which has obtained since before the flood, should come to naught, the poor Indian is doomed to disappointment when he arrives at his hypothetical "Happy Hunting Grounds." The like misfortune may befall us all!

CHARLES HALLOCK.

[We print Mr. Hallock's correction; but protest that we would contemplate with terror a speculative discussion of immortality for the lower animals.]

The Awakening of Virginia.

Editor Forest and Stream:

The Legislature of Virginia, during its last session in effect re-enacted its game laws. This legislation is a great step forward, and will doubtless be highly commended by all those interested in preventing the useless slaughter of game. The object of game protection, primarily, is to preserve game from extinction, to increase the supply necessary for food and incidentally to provide sport with rod and gun.

Virginia has desirable game fields; deer abound in her mountains, wild turkeys and partridges in her woods and fields, shore birds and wild fowl in her tide water, and there is plenty of sport for the fisherman. Rightly cared for, this should be a source of wealth to the State.

Protection will increase the supply of game for the markets of the State, increase the number of men employed in the care of game and otherwise by sportsmen, entice non-residents to come within the State and expend their money in the employment of guides and the establishment of preserves and the propagation of game. The influx of non-residents is to be encouraged, as their private expenditure is great and the cost to the State of protection can be greatly reduced by exacting a license fee from every such non-resident. In return the non-resident should be treated liberally, and should be allowed to take his game with him provided it is for private use only, and under no circumstances for sale. The amount so taken can be controlled by limiting the number of birds to be killed in a day or else limiting the number to be taken out of the State. Perhaps it would be fairer to limit the number of birds to the gun for each day, and then allow the non-resident, who has paid a license fee, and perhaps, in addition, has maintained a preserve at great expense, to carry with him his game, provided the same shall not be sold or offered for sale.

Notwithstanding all natural advantages above alluded to, the game laws of Virginia have been heretofore extremely lax, and the value these resources might be made to the State seems to have been largely overlooked until the last session of the Legislature, when a bill for the better protection of game was passed.

The principal features of the bill, briefly stated, are substantially as follows: It prohibits the shooting of wild fowl by night and the use of sneak boats and artificial islands, but the law does not prohibit the use of batteries, and every sportsman knows that batteries will eventually drive out the game from any given locality. The law makes a close season for wild turkeys, pheasants or grouse, quail or partridges, and woodcock east of the Blue Ridge Mountains, between Feb. 1 and Nov. 1, and west of the Blue Ridge Mountains between Dec. 31 and Nov. 1; makes a close season for deer from Jan. 1 to Oct. 1, and a close season for wild water fowl from April 1 to Oct. 15; but allows the shooting of summer ducks after Aug. 1. The close season for shore birds is from Jan. 1 to July 20, and the law permits the shooting of robins from the 15th day of February to April 1.

It is also unlawful to shoot any game later than half an hour after sunset or earlier than half an hour before sunrise, or to shoot or hunt on Sunday.

The law also provides for the appointment of game wardens, but the number of these wardens is limited and there is no provision for their increase, nor for the appointment of an extra warden upon the petition of those willing to pay the salary of a warden. A license fee of \$10 is exacted from all non-residents, which license continues in force for six months. The money received for licenses is used to pay the game wardens.

The exportation of game from the State is prohibited, except any citizen of the State may, during the open season, ship as a gift and not for market or sale, one deer and not exceeding three wild turkeys, six pheasants, twelve wild water fowl, eighteen partridges or quail, provided such game shall be shipped exposed to public view, and shall be plainly labeled with the name and address of the donor and of the donee.

The law then provides, "Any person authorized to hunt under the laws of this State may, during the season, take with him out of the State either in his personal possession or as his baggage, on the same conveyance with him, not in a closed package, but exposed to public view, not exceeding thirty wild water fowl, fifty quail or partridges, ten pheasants or grouse, three wild turkeys, one deer, or plovers, snipe, sandpipers, willets, tattlers or curlew, not exceeding twenty-five of each, or not exceeding one hundred in the aggregate, when lawfully killed or captured by himself, provided the same be plainly labeled or tagged with the name and address of such person."

The law also protects wild birds other than game birds, their nests and eggs.

The final clause of the bill reads as follows: "Provided that nothing in this act shall be construed as repealing a special act approved March 8, 1902, restricting the shooting of wild water fowl in Black Bay and its tributaries in the county of Princess Anne."

This exception was undoubtedly intended to preserve the rest days in that county, but unfortunately, the exception is so broad it practically leaves that county without any protection as to its wild fowl, as the Act of March 8, 1902, not only does not prohibit the use of batteries, but directly provides that nothing in the act shall be construed to prohibit the shooting of a duck known as a "peler" or "blue peter," and this nullifies the rest day, as these pelers are shot from sailboats

on rest days as well as every other day, and in those waters where such shooting is carried on the duck shooting has been completely ruined. The effect of the shooting of blue peters was referred to in a communication entitled "A Disgrace to Virginia," which appeared in your valued paper of Dec. 13, 1902.

The law contains one provision which cannot be passed by without comment. It provides the Board of Supervisors of any county shall have the power to shorten the open season in their said county and may permit the shipment of wild water fowl from said county or out of the State. This is most pernicious. It virtually destroys the State law and authorizes a county law, which may differ in every county of the State, therefore making as many different game laws as there are counties in the State.

This experiment of giving the supervisors the power to enact laws, has been tried in several States, and in all has ended most disastrously, and in effect as if there were no law. If a charge was made of a violation in one county, it was always shown that the act happened in an adjacent county, and convictions were impossible. A game law is, and should be, a State measure, and not a matter of mere local legislation.

Taking it all in all, certainly the people of Virginia are to be congratulated on the passage of the bill. The lovers of game throughout the country will rejoice, and doubtless the sportsmen of Virginia, now that they have taken up the matter, will watch the operation of the law and procure additional legislation to remedy any defects in the law as it now stands. It is most respectfully suggested that the Legislature be requested to protect wild water fowl by prohibiting battery shooting and making the law apply to "pelers" or "blue peters." The open season, too, is too long, and in the writer's opinion the season should not open until Nov. 10, and certainly no shooting of wild fowl should be permitted after March 1.

Let a word be said in behalf of the summer or wood duck. This duck is almost extinct, and its killing should be prohibited for certainly a term of years, and if this be not possible, the open season should be the same as for other duck. Many of the young birds are but half grown in August, and to open the season the first of August is but to permit the complete annihilation of the species.

Cannot the potent voice of FOREST AND STREAM be raised to urge the reforms mentioned?

XPER.

NEW YORK, Aug. 17.

Adirondack Deer.

THE season for deer shooting in New York State is near at hand, and many hunters are making arrangements to be in the Adirondacks on the opening days. The law provides that the open season shall begin on Sept. 1, and continue up to Nov. 15. No person is allowed to take more than two deer in one season, and very few men outside of those who live in the woods have the opportunity of violating the provision of the law in this respect, even though they have a disposition to do so. Judging from reports received from the wilderness region of late, there seems reason for believing that deer hunters will have good sport this fall, but, of course, it is too early yet to arrive at any positive conclusion on this point. Large numbers of deer have been seen in the Adirondacks this summer, and their paths and runways traverse the woods in all directions, many of them being found in places where they have not been seen before in years. These facts encourage many enthusiastic people to believe that the cervine animals have increased considerably in numbers, but it is not always wise to jump at conclusions even when the indications all seem to point in just the direction we wish. Before accepting as conclusive the reports that deer are remarkably abundant, it is well to take certain things into consideration. In the first place the summer season is the time of all others during the year when deer most frequent the water, and as most visitors to the woods spend the greater part of their vacation on the lakes and streams, it stands to reason that they will be apt to see deer, the conditions being exceptionally favorable for it. Naturally the deer are quite tame now, as no shooting is allowed until fall and dogs are not permitted to chase them. Then there is another thing to be looked at and that is the fact that the extensive forest fires which prevailed last spring and which destroyed a vast amount of vegetation, obliged many of the deer to shift their feeding grounds. In some instances this change has brought them nearer to the outskirts of the wilderness and in closer proximity to human habitations and much-used lines of travel; hence the greater frequency with which they are seen. No doubt this fact also accounts to a considerable extent for the establishment of new runways in localities where they have been hitherto unknown.

Men who have had long experience in deer hunting have learned not to place too much reliance on reports of the great abundance of deer, which are based solely on the numbers seen during the summer, for it has happened repeatedly that the expectations thus aroused early in the season have not been realized. On the contrary there have been two or three years within the past decade when, though deer were reported plentiful in August, hunters found it almost impossible to catch a glimpse of one during September and October. The animals appeared to have vanished as soon as the shooting season opened, and they remained out of harm's way until very near its close. Sportsmen were completely mystified, as they could not even find fresh signs of deer in the localities where only a short time previous they had been seen in considerable numbers, but they were even more surprised during the last week or two of the open season by a complete reversal of the conditions and the reappearance of deer everywhere in the wilderness region.

The result of the hunters' work in these years was that there were more deer killed during the last fortnight of the hunting season than in the entire eight or nine weeks preceding. The best explanation of the strange disappearance and reappearance of the deer in the years referred to appears to be that as soon as the shooting season began the animals forsook their

summer haunts and retreated to the most secluded portions of the woods, remaining there until cold weather and occasional snowstorms caused them to make another change of base preparatory to going into winter quarters. Whether or not the shooting influenced their actions is immaterial, as it cannot alter the fact. Of course it is possible that somewhat similar conditions may prevail this fall and that the deer, which now seem so plentiful throughout the Adirondacks, may make themselves scarce immediately after Sept. 1. If the deer continue to show themselves as frequently and conspicuously after the shooting period begins as they have done lately, hunters may expect to have splendid success at the outset. On the other hand, if the game acts as it has been known to do in the past, the amateur hunter cannot hope to have much luck prior to Nov. 1, unless he secures a good guide and penetrates to the least frequented parts of the wilderness. It would be a source of extreme gratification to veteran hunters to be able to believe that deer are more numerous in the Adirondacks at present than they were last year or in other recent preceding years, but additional evidence will be required to convince those who are familiar with the existing conditions in that region that such is the case. It is altogether probable that a much more intelligent and accurate opinion in regard to this matter can be formed by the middle of November.

W. E. WOLCOTT.

UTICA, N. Y., Aug. 24.

CHICAGO AND THE WEST.

A New Day for the Western Forests.

CHICAGO, Ill., August 22.—Considerable attention has been given by FOREST AND STREAM during the past few years to the question arising in connection with the establishment of the national reserve, popularly known as the Minnesota National Park. The latter name, as applied to this new possession of the American people, is simply an incidental one, and indeed is in some sense a misnomer. This great park, near the headwaters of the greatest American river, is in no sense a State affair, but one in which the people not only of the West, but of all America are intimately concerned.

They are so concerned perhaps more deeply than at present they realize. They may perhaps not for years, perhaps never, be able to take personal advantage of this little portion of the wilderness which the wisdom and foresight of a few men have secured for them and their successors, yet they are now, and presently will be far more vitally affected by the animating principles connected with the project of this park.

In brief, the establishment of the Minnesota National Park has made not so much for the accomplishment of an enterprise conceded to be laudable, not so much for the added attractiveness of a great State wonderfully endowed in natural charm, not so much even for success in a praiseworthy and hard fought personal campaign on the part of those who won it through, as it has for the utter change and revolution of the hitherto existing attitude of the American people toward its own natural possessions. The Minnesota National Park as it exists today is a small body of land. Presently, as we shall show, it may be larger, very much larger; but identified with it are many greater things than can be assigned to its too narrow boundaries.

One of these things is the fact that the Government of America to-day admits that there is no West, that indeed there is no America such as that which once we knew. It admits that the forests of this country, so long wastefully and ruthlessly destroyed and stolen by a few, were worthy and are worthy of a better fate. It says to-day—though that fact is perhaps not well established in the mind of the average reader—that from and after the establishment of the Minnesota National Park the Government of the United States, which is to say the people of the United States, will no longer ignorantly sell to an unscrupulous few the pine bearing lands at a price of a pittance to the acre. Realizing all too late the value of this pine timber, the Government resolves from this day to sell not the land but the pine itself, and that under rules, restrictions and reservations. At last, all too late, we are beginning to take stock of our goods and to propose to market them hereafter upon principles more nearly allied with business sense and common justice. This, then, is the great story connected with the unselfish project of the establishment of this miniature National Park in the upper pine lands of Minnesota.

Details of the Reservation.

The national park, as it now exists under the Morris bill, comprises about 830,000 acres in all. Of this about 218,000 acres is made up of water. Indian lands cover about 150,000 acres more. Under the United States forestry regulations comes the great acreage of 460,000 acres, made up of all the forty acre tracts on which there is merchantable pine. There are about 260,000 acres on which there is not pine enough to redeem the land from its designation of agricultural lands. This acreage was, in the opinion of Congress, too great to be left intact as to its standing timber. It is to be forested under the regulations of the United States Government, except the island in Cass Lake, the great peninsula on Leech Lake, and about 12,000 acres of other land, about 25,000 acres of the tract being thus left absolutely virgin forest. Perhaps this is all the Government can afford at first. There is some fear that the little island in Cass Lake, known as Cooper Island, may cost the United States Government nearly a million dollars in purchase money from the Indians, who are entitled to that pine as much as any.

Now it is proposed in this bill which Col. Cooper will present next winter to Congress to increase this acreage by large tracts of cut-off pine lands, which will be deeded by their owners to the United States Government to be held in trust under United States forestry regulations, the new growing timber of such denuded lands later to be sold under Government reservations and regulations for the benefit of the heirs, successors or representatives of such devisors.

Good Game Cover.

This apparently has no specially attractive sound. But have you watched the swift way in which nature covers up her scars? Watch the sudden up-springing of the poplars, the maples, the soft wood trees, indeed of the little pines, over a tract which has once been cut off or burned over, provided only that the perpetually devastating forest fires be kept from such tract. As a matter of fact, a few years will serve to make a lumbered-off pine country once more into a lesser wilderness, with cover complete enough for the wild game and the wild waters. Hence, even before Col. Cooper and the rest of us are taken from this scene, there will be growing up all around the headwaters of the Mississippi River what one may hope to be able to call the first increment, the first addition to the Minnesota National Park. The virtue of the Cooper proposition, which will in all likelihood find expression in Congressional enactment, lies in the fact that to establish a wilderness you must keep out forest fires. It is expected that the United States Government will put all this tract, present and to be, under the vigilant guardianship of regularly trained fire wardens, many of whom will in all likelihood be drawn from the ranks of the native Indians, than whom no better fire wardens ever could be found.

The West that Was.

So this, then, is the history of at least one part of the West which has seen change; of a West which, let us hope, may still be preserved and retained and handed down at least in some part of its former beauty and dignity to the generation of sportsmen and wilderness lovers yet to come. If the FOREST AND STREAM in its humble way has done anything to make obvious the record of this enterprise and to place the credit thereof where it is properly due, it will, I am sure, never have occasion to regret that fact.

"Thirty."

So much for a little part of the outdoor history of that West which was this writer's native country. For many years I have wandered in one part or another of that West, and have loved it all. For very many years I have been privileged to write about it, as best I might in my own feeble way, in the pages of a journal always clean and dignified and strong and useful. Given an unusually free hand in my humble journalistic connection, I have been privileged beyond many of my fellow men in learning about many quarters of this West, though I am sure I love it no more than many others who know it. In this work, this undertaking as much of love as of labor, I have made a great many acquaintances and I hope a few friends. They are very dear to me. I love them all, every one.

Once upon a time there was a telegraph editor whose name is now forgotten, but whose sign manual under the code was just the number "30." He handled all the late telegraph news, and when the boys early in the morning got his signature, "30," they knew that all the stuff was in and that they could close up the forms. Therefore, after newspaper fashion, the sign of "30" came to mean that it was the end, that everything was finished; and to-day the character "30" on newspaper copy means "that's all."

It means that the story is told. Therefore it means, sometimes, good-by. I don't like to say just how I feel as I write to-night under my copy the old newspaper sign of "30."

E. HOUGH.

ASHLAND BLOCK, Chicago, Ill.

The Connecticut Trespass Law.

Editor Forest and Stream:

Your correspondent, Mr. Shurter, says: "Now I ask in all candor, and with envy and hatred toward none, is it wise to advocate a policy which is almost certain to bring ruin and destruction on the very things which we wish to preserve?" "In all candor" I answer no!—emphatically, no! And this is the identical reason why every description of game preserve should be encouraged—State, national, the poor man's and the rich man's. The discouragement of game preserves of any description invites the "ruin and destruction" of forests and game.

As proof of my claim that the rich man's preserve helps to stock the surrounding country with game, through its overflow, and that "it may possibly convince" Mr. Shurter "that there are two sides to this game preserve question," I submit the following Associated Press report to his careful consideration:

"FORCED TO FREE DEER.

"A Thousand Head to be Turned Loose to Prevent Starvation.

"Stroudsburg, Penn., Aug. 14.—A thousand deer are to be liberated from Buckwood Park, owned by C. C. Worthington, of New York, in a few days. The animals have multiplied so rapidly that they will starve unless freed. There are now over 2,000 deer in the park, and they have cleaned up nearly all the food to be had.

"Superintendent Smith intends to let down some parts of the fence inclosing the park and let the animals roam out wherever they choose. Farmers near the park do not favor the liberation, fearing the deer will do damage to their property. Eleven years ago nineteen deer were placed in the park, which covers thousands of acres, and the animals have multiplied rapidly. One hundred or so have been killed by hunting parties."

Then there is the note from Von W., in FOREST AND STREAM of Aug. 15. "I can only attribute the great number of deer seen in this vicinity, on both sides of the Connecticut River, within the past two years, in one case seven in a herd, to the overflow of the Blue Mountain Park twenty miles north of here, established by the late Austin Corbin." And right here, in the State of Connecticut, no one even dreamed a few years ago that deer would ever again be seen. But they are with us in increasing numbers, and much of the credit for this state of affairs is due to the fact that some of the animals escaped from a carload on their way to the preserve of William C. Whitney. All of which makes

to prove that the big private preserve is not "foolish in policy," simply because "it arouses bitter animosities," and "incites the spirit of revenge" in the criminal element. It can incite that spirit in no lawful element, and no law-abiding citizen can harbor anything but feelings of the deepest and most fearless contempt for the acts of the criminal.

Another side to this question is that agitation against landowners lawfully doing as they please with their land, is surely harming the cause of those who go a-field with dog, gun and rifle. As proof of this, I point to the law recently enacted by the Connecticut Legislature. It is no longer required that land shall be posted, whether wild or cultivated. Any trespasser may now be taken into custody without warning. And this is owing to trampling on the rights of those who own the land by those who don't. Agitation which steps on the toes of one landowner treads on the corns of another. The law reads:

Every person who shall throw down or leave open any bars, gate, or fence upon the land of another, or who shall enter upon the land of another without permission of the owner, occupant, or person in charge thereof for the purpose of hunting, trapping, fishing or taking or destroying the nests or eggs of birds, or bee hunting, or gathering nuts, fruits, or berries, shall be fined not more than fifty dollars, or imprisoned not more than thirty days, or both. The possession by any person, while trespassing upon the land of another, of a gun, dog, ferret, or fish rod, shall be deemed prima facie evidence of his intention of hunting or fishing thereon.

The owner, occupant, or person in charge of the land, or such persons as he may command to assist him, may arrest any person violating any of the provisions of the preceding section, and forthwith take him before some proper authority, who shall, upon complaint of the proper prosecuting officer, proceed to try such person.

The farmers had more to do with framing that law than any other element.

"If preserves are necessary let them be State or national preserves, and let everybody stand upon an equal footing with respect to them."

Everybody should and would stand upon an equal footing in that case. And I, for one, am heartily in favor of such preserves. But this neither argues that there should be no private preserves, nor that everybody should "stand on an equal footing" with the individual who owns, and pays the taxes on, a private preserve, in the enjoyment of the same. And no individual who is conscientiously working within the laws of this land, need or will fear threats of revolution, disaster, ruin, etc., etc. Such yarns carry one in memory back to the spooky fables of childhood, and should be classed with the same. They frighten only the imaginations which give them birth.

WILLIAM H. AVIS.

HIGHWOOD, Conn., Aug. 21.

Sportsmen And.

See you now,
Your bait of falsehood takes this carp of truth;
And thus do we of wisdom and of reach,
With windlances, and with assays of bias,
By indirections find directions out—
You have me, have you not?
—Polonius.

Veritatis simplex oratio est. Stet.

It is dangerous for contributors to FOREST AND STREAM to step out of the conventional covers and thickets into open ground. Hunters watch so narrowly. If a fellow makes a little bound or two and kicks up his heels, he is not only in danger of being shot with foreign phrases, from any corner of the world, but sleepy stags all about him prod him with their tines to scare him into the bushes again!

It has taken me a goodly number of years to accumulate what I consider a few authentic things relating to nature and mankind, but when I try to put some valued assertion upon record, other fellows shoot Latin, and philosophy as old as Latin, my way. Even the broad-gauge editor of this journal either fails to understand me, or he refuses to indorse my philosophy without reservations—but diplomacy is quite essential to any good captain or pilot. Even sky pilots—

"E'en ministers tha' ha' been ken'd
In holy rapture,
A rousing whid at times to vend,
And nail 't wi' Scripture.

And so, when those of wisdom and of reach do not indorse me openly, I lay it all to diplomacy of one kind or another, so that I am not jarred.

The trouble is that if I try to make a bland assertion, without qualifying it into obscurity, they jump upon me under the pretext that I am egotistic, dogmatic, or that I am describing an elephant blindly by the way it feels!

As instance, when I indorse Government preserves of wilderness and game, as well as private preserves, folks persist in advocating State reserves to which the public shall have free access (with measures taken that no one shall interfere with everyone taking everything!), and this with any number of great States destitute of all large game and much wild territory denuded of everything of value that was capable of being taken.

Does it conform with the motto: "The greatest good to the greatest number" that every deer and every beaver in a great State like Illinois should be exterminated in a period of forty or fifty years? That many of the States having no private preserves or national parks are as destitute of game, and forests, too, as Illinois, who will deny? Was it this policy to permit nearly every buffalo of a vast region to be the sport of the "people" until every living animal on the "play-ground" was destroyed?

As instance, when I assert that "in many cases it is the men who kill animals directly who are most active in preserving and increasing the animals for a useful purpose. The men who shoot game are at the present time the most earnest in efforts to protect and provide for it." Your correspondent, Mr. Abbott H. Thayer, asks if I mean this for a joke! Again, when I write, "Whoever hears of any one except sportsmen doing anything to protect game animals or birds or fish?" Mr. Thayer says I should know about the Biological

Survey and naturalists that are at work preserving species.

Now, the difficulty here is the old matter of defining that word "sportsman." Mr. Thayer forgets that the most active members of the Biological Survey, and the wisest naturalists, may be sportsmen also. He seems to catalogue sportsmen, as many other people do, as "men who kill game," or as Didymus did three or four years ago when he wrote "Sportsmen are men who shoot, and let it go at that."

The facts of the topic are that the word "sportsman" does not fit the men who contribute substance to these columns, for, in the minds of many, a sportsman is a sort of pot or market shooter; merely this and nothing more. But this is a worn theme. Three or four years ago I tried to tell FOREST AND STREAM that the word sportsman was a misfit, but I was like the Hollander shearing hogs—there was a great outcry, little wool.

As far as the word defines the class of writers who contribute to this journal, it would be as explicit to leave the "sports" off and call them men, perhaps, better, for they would not then be confused in the minds of many with all the sports in the category of human diversity. In the perspective I see, in my mind's eye, as I recall what I can of twenty-five years' reading of this journal, I conjure into being many explorers, naturalists, deep thinkers and students, artists with pen and pencil, poets and philosophers, with not a few profound scientists. With all my conjuring I cannot collect any notable group of real sports.

Doubtless the old word will stand, for it has stood terrific strain. But it chafes like cockle-burrs to have a tyroic paragraph like the following fired into us:

"As a choice of evils it (the Biological Survey) often joins ranks with sportsmen, preferring to keep up a species even for them to decimate rather than to see it vanish altogether."

Again, "Look at these two forces, side by side, in the effort to preserve game. The naturalists striving to save it to study and admire, * * * the sportsmen that they may kill it! Would any disinterested judge hesitate as to which of these attitudes is most representative of humanity's hopes to-day?"

The burrs chafe. But it is because Mr. Thayer has pot-shooters in his perspective and thinks them sportsmen. Webster's dictionary of the English language helps him to fortify his position while he fires such chain shot into us. *Ohe! jam satis.*

CHARLES L. PAIGE.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Two Sebago Salmon.

Editor Forest and Stream:

I recently had the opportunity to see two mounted specimens of landlocked salmon, such as an angler seldom has the chance to land. These were in the store of my neighbor in Brighton, which constitutes one of the suburban wards in Boston.

The proud possessor of these fish is Mr. T. F. Horrigan, as ardent and enthusiastic an angler as ever lived. One of the salmon, a female, weighed 17 pounds, as it came from the water, and its mate, a male, weighed 13½ pounds.

The story of the capture of these is as follows:

Mr. Horrigan and his wife were spending some days at Sebago Lake, Me., in the latter part of July, they having gone there for the purpose of salmon fishing. When they arrived the reports were somewhat discouraging, and the outlook gave little promise of success. They were told that people who had fished the lake for day after day had failed to land a single salmon, and the chances of their return to Boston with unfulfilled hopes as their traveling companion were more probable than any other result.

But the true sportsman is seldom balked by adverse reports of this kind, and that proved to be true in this case. Mr. Horrigan secured the services of Tom Hill as a guide, and started out to try his luck late in the afternoon of July 23. His wife did not go with him, as he expected to do little beyond "trying the ground." It chanced, however, that there was an exceptionally good run of smelts at the surface that afternoon, and as these are the food preferred by landlocked salmon, the latter were also higher in the water than they had been found for some time previously. It was not long, therefore, before Mr. Horrigan had a strike. And as the fish repeatedly sprang high in the air, and he could see the bulk of it and also more fully realize its strength and fighting capacity, he appreciated the task of bringing to net, with a six-ounce rod, a salmon of such proportions. Meanwhile the fish rushed as only "the gamest fish that swims" is capable of; it sprang into the air and fell splashing into the water, always trying to shake itself free from the hook that had pierced its lip. But there was a cool, experienced head and a steady hand at the other end of the line; also a keen appreciation of the fact that, with a slight rod and a fish not too strongly hooked, nothing short of care and skill could achieve victory. This was a contest where "giving him the butt" and "reeling him right in" could not be seriously considered—at least, until the storage battery of strength that at first animated the active fish, was exhausted to a considerable degree. Finally brute force yielded to human skill. The salmon was gradually brought near the boat, its noble proportions showing more plainly as it floated on its side, no longer able to struggle, and its dark spots and blue back contrasting with the silver iridescence of its lower parts. It was a moment of anxiety as well as exultation for angler; the moment of all the contest when he felt the keenest concern. For as the fish floated slowly in, Horrigan's keen eye had noted that the hook had only a slight hold, and the smallest error in using the landing net might cause the loss of the prize, so eagerly longed for. "Be sure and get the net

well under him and don't touch the hook," was the caution given to the guide, whose long experience had taught him what to do. Nevertheless, the net caught the hook, which quickly slipped from its hold and left the salmon floating—helpless to be sure, as it chanced, but with nothing to restrain him if, perchance, he had gained sufficient strength just then to move away.

"Quick! quick! get that net under him!" excitedly cried Horrigan, as he thought his treasure was about to slip from his grasp. But no sooner said than done, for instantly the bowed net was slid under the fish, and, before it had a chance to flirt its tail, it was lifted into the boat.

It is unnecessary to go into details about the triumph that shone in the captor's eyes; every angler can guess what it was like, especially if the has won victory where he scarcely dared look for it.

Did he throw in again? No. Great as the temptation was he did a manlier thing, he requested his guide to row to the shore as soon as could be, so that he could get his wife. Shortly thereafter they were all back at the same spot, and Mrs. Horrigan was told where it was thought she could get a rise. The cast was made, when, almost immediately, whiz, whirr, went the reel, a big salmon leaped into view and the second battle was on.

It goes without saying that Mr. Horrigan "coached" his wife with as much zeal and interest as would be shown by a professional coach when training a boat's crew for a regatta. "Give him the butt, a little. Easy on him, now! Don't let him get slack line on you! Your sleeves bother you, do they? Then let me roll them up. That collar is choking you, is it? I guess tain't quite the thing for this kind of exercise. You watch your fish and I'll get that collar off."

And off it came, with less ceremony, perhaps, than might have been observed under other circumstances, but the lady's sporting blood was now at high tension and she didn't even enter the gentlest protest. Her eyes shone with the light of battle, as her shapely bare arms bent hither and thither, following the movements of the struggling fish.

After one leap the salmon sulked and played deep, but he fought well, nevertheless. It was exciting, and the intensity of the sport was evidenced when Mrs. Horrigan turned to the guide, saying: "If I land that fish I'll give you \$5." "And I'll give you another five," exclaimed her husband.

It is probable that the guide, whose blood was up, too, might have done all possible without the spur of this promised reward. However that may be, it is not supposable that he felt less satisfied with the result when the old "hook-jaw" lay in the bottom of the boat, and two crisp bills were laid in his hand.

"Now, we'll go home," said Horrigan, and both he and his wife agreed that their experience was "quite enough sport for them at one time."

But the catching of the fish was not the sole satisfaction secured, for this generous sportsman shared with his friends the pleasure of eating the fish. The writer received a liberal piece of it, and enjoyed the gastronomic feast most fully, although ready to concede that the real edge of zestful appetite is known alone to the victorious angler, after he has landed this royal game fish. J. W. COLLINS.

Camp of the Oak Leaf Club.

WHEN the latter part of May came and the pleasant weather naturally suggested, to the person who loves to live, an outing of some kind during the weeks to follow, the Oak Leaf Rod and Gun Club met, making final arrangements preparatory to the departure on June 1.

The number consisted of two families of two and a third family that had in it a third member, a daughter about eleven years of age, who was the "Little Nell" of our camp.

June 1. The hour of 8:30 o'clock found us starting for Camp Mary Ann on the Rocky Fork of Licking River, near the ruins of what once was the Mary Ann Furnace. Arriving at 1 P. M., we pitched our tents and prepared to dine. Ever ready for camp life, the anglers started to try their luck in Rocky Fork. The first great splash was not a great fish, but one of the number had already been initiated by falling in.

Returned toward evening with two black bass, one weighing 2 pounds and one 3.

The saying that you must not question a fisherman as to the weight of his fish for the scales may be found wanting, does not apply to the members of our club, as they fish for the sport of it and not for pounds of fish. If any chance to see the diary kept by us of our outing, they can rely upon the truth of it, for it is a simple record with the genuineness of the fun left out, as that cannot be pictured by the pen.

June 2 found us all alive and well after a good night's rest and ready for another day, which was begun by taking a picture just after breakfast.

Seven black bass, ranging from 3 pounds down, and three fine channel catfish were the record of the second day.

The third day the catch was increased to nine bass, and we lost the three cats, stolen, as we supposed, while we had trusted to the honesty of our neighbors, and left the camp unguarded.

Investigation revealed the fact that they had escaped through a hole in the keep.

Upon the return of the men in the evening, they were asked to solve a problem, one probably not so difficult as the one about the fox, the goose and the corn, but how four ladies who wished to buy milk and eggs on the other side of the creek had crossed with only two pair of rubber boots that had been left in the camp.

June 4. We took some snapshots, fording the stream, just before the fish; also a group, including our visitors, who had arrived after a ten-mile ride and found us at the breakfast table. They were neighbors at home and had brought us the newspapers, the letters from our friends and other mail, with business letters, that reminded us of business cares that we would rather not hear of in our present surroundings.

We had almost forgotten in the few days away that there were such things as trolley cars, offices and electric lights.

The harshest note that broke the stillness there was the bass solo of the frog and the evening song of the whippoorwill.

June 5. A rainy morning. Got up late, late breakfast and late dinner. The day was spent in lounging about the camp until late in the afternoon, when it cleared off, and we went, taking pictures above the furnace.

On the 6th we broke camp at Mary Ann, and were en route for a new camp on the bank of the Wakatomaka by 7 o'clock. The camp at Mary Ann might have been more pleasant had the fishermen had better luck. The weather prophet had some sort of a spite at us, too, having a too plentiful supply of rainy weather on hand to suit camp life. At starting all were jubilant and continued to be so, singing and enjoying the beautiful scenery until the continued rain dampened our ardor, and when we were compelled to sit in puddles of water which had collected in the canvas that covered the load, and on top of which we sat, we were a blue looking crowd. We arrived at Frampton and soon had the tents pitched and dinner ready. The hospitality of the people soon made us forget our long rainy journey. The greatest catch so far, a two-hours' fish, resulted in bringing in about 20 pounds of bass.

June 7. Sunday morning showery. Spent very different from most Sundays. Nearly all the clothing and bedding belonging to the camp was wet. Every time the sun came out it was all hung on the line, and every time a sprinkle of rain was felt the alarm was sounded and all hands joined in bringing the things in.

Dinner was at 2:30, and scarcely over when company arrived, friends we had made when on a hunting trip. The faithful dogs, who did the fielding for us at that time, we had with us on our fishing trip, but they amused themselves by swimming in the stream, or running at will, sometimes making points on quail, but all in vain, for there was no report from a gun, only as we amused ourselves shooting at a mark.

June 8. The creek was muddy. A rain at the headwaters had raised it and spoiled the fishing. The men divided, one going down stream frogging having splendid luck; while the rest fished with the ladies near the camp. As the labor of fishing was very light, when evening came all seemed to have an unusual amount of energy on hand.

When the campfire had burned low and we were getting drowsy and began to think of retiring, one of the number, whom we had nicknamed Happy Bob, and who was always a little more hilarious than the rest, decided to entertain us in front of the big tent.

This was the second performance of the kind given by him, and was pronounced a grand success. The music was furnished by his assistant, Doc, on their bass drum, a store box and a big stick. Happy Bob performed in cream-colored tights to the music of the drum, and you may know did some graceful feats. The man who lived next to our camp, declared to us the next morning that he had seen a ghost, and no one doubted his word.

June 9. Creek still muddy and no fishing in the forenoon. About noon "Dad," who had been deprived of any part in the performance of the previous evening, ushered into camp a large turtle that had been captured along the creek. He had fastened to it eight or ten feet of rope and would start after us, one at a time, throwing the turtle to the end of the string. A stampede followed, and was ended when the turtle had been nailed to a tree and beheaded.

The evening of the 9th, Tuesday of the second week, the spirits of the fishermen were raised by another large catch of about a dozen fine bass.

June 10. Nine bass were brought in.

June 11. When camping, after you have cooked what you want and have eaten, you consider your work done. So this morning, just as we had finished breakfast, one of our neighbors drove down across the field toward our tents with the mule team and big wagon, expecting to take the men about four miles down stream to the old Gault mill, where they intended to fish in the dam. At sight of the team and the wagon we all wanted to go. No objections were made, and we soon donned our big straw hats, taking some light wraps and an umbrella, as it was cloudy and looked like rain. Thoughts of the breakfast table and preparation for another meal were thrown to the winds, and we all started for a merry ride behind the mules. The road to the mill was new to us and we enjoyed the ride.

Crossing the Licking county line, the road led us into Coshocton and on down to the mill. The old mill and the dam furnished good material for pictures, and we took several. The hooks were scarcely cast in the stream when it began to rain, a cold rain, too, for June; and the day's fishing was practically at an end.

Later in the afternoon bank fishing was tried, but with no success worthy of mention, save that we had fish for breakfast the next morning, our last breakfast in camp.

The morning of the 12th found the ladies busying themselves early with getting breakfast and packing a lunch, to be eaten on the way, while the men packed the sleeping tents and contents. The kitchen and dining tents were then torn down, and by 9 o'clock we were bidding our kind friends on the Wakatomaka good-by.

I. M.

Brown Trout in Vermont.

MANCHESTER, Vt., Aug. 23.—*Editor Forest and Stream:* A few days ago a brown trout was taken in our river (the Battenkill) that weighed $7\frac{3}{4}$ pounds. It was $26\frac{1}{4}$ inches long, and a finely proportioned fish.

Some years ago I hatched out a lot of brown trout and of our native trout, and planted the fry in our streams about here; and many fine brown trout have been taken. Evidently the brown trout have thrived, and they are very fine fish in these waters; very gamy and rise to a fly quite as freely as our native trout, and as they grow much faster I consider them very desirable.

C. F. ORVIS.

The Asbury Park Tournament.

ASBURY PARK, N. J., Aug. 22.—*Editor Forest and Stream.*—The Asbury Park Fishing Club held its second annual casting tournament on the Athletic Grounds Wednesday, August 19, from 9 A. M. until noon, and from 2 P. M. to 5 P. M. It is one of the events of the season here, and attracts a vast throng of people.

Owing to the fact that the busy season is on, many of the most enthusiastic fishermen were unable to be present, and so were barred from a chance at the really handsome and valuable prizes offered by the club.

A heavy southeast wind prevailed all day, and severely handicapped the performers, as the casting lane lay quivering to the direction of the wind, making accuracy almost impossible. The appended rules and regulations governing the contest thoroughly explain the matter:

1. Contestants may use any make, size or weight of rod, reel or line, but no throw-off attachments on a reel will be allowed.
 2. A dry or wet line may be used.
 3. The regulation three (3) ounce bank lead with swivel attachment must be used, said leads to be furnished by the Contest Committee.
 4. The average of five casts to be counted.
 5. After the lead passes the starting line it constitutes a cast. If lead strikes inside of lane and bounds out, said cast shall be counted from place at which it struck within bounds.
 6. Snarls, fouls or breakage behind the line will give the contestant another trial.
 7. If the lead strikes out of bounds, it constitutes a cast, and is scored as nothing.
 8. The width of the lane shall be 25 feet.
 9. In the event of a tie, the contestants who are in the tie will cast over again. Best average of three casts winning.
 10. The longest individual caster will be awarded a prize, if not a winner of any other prize.
 11. The largest average of five casts shall be awarded a 2-0 Vom Hofe reel.
 12. The second best average of five casts shall be awarded a Seger rod.
 13. The third best average of five casts shall be awarded a belt rod holder.
 14. The largest individual cast, who is not a winner of any other prize shall be awarded a tackle book containing one dozen leaders, two dozen hooks and one dozen swivels.
 15. Each contestant will be given a number when he arrives on the casting grounds. Any contestant not answering to his number when called to cast shall lose his cast.
 16. No practicing of casting will be allowed on the grounds on the day of the contest.
 17. Prizes to be awarded at end of contest.
- The club also gives for the largest striped bass caught with rod and reel between north side of Manasquan Inlet and south side of Broadway, Long Branch, from May 1 to Nov. 1, 1903, a first quality Vom Hofe reel, 3-0.

To the inexperienced it would seem quite an easy matter to cast within the boundaries of a twenty-five foot lane at each and every cast; but when it is known that no more expert rod and reel men are to be found in the world than those belonging to our club, and the fact that many casts went badly astray, establishes conclusively that it is not a simple matter, but one requiring the utmost care and skill.

The prize winners were as follows:

First—J. F. Marshall, New York, average of five casts, 174 feet 5 2-5 inches.

Second—Winfield Scott, Asbury Park, average of five casts, 170 feet 8 4-5 inches.

Third—R. L. Fleming, Jersey City, average of five casts, 157 feet 4 3-5 inches.

Fourth—Longest single cast, Lloyd Marshall, Brooklyn, N. Y., 204 feet.

Fifth—Consolation prize, bamboo rod, W. W. Scheffler, New York, 12 feet 6 4-5 inches. The last named, usually a long caster, went so persistently out of bound that the summary was most remarkable.

The prize bass so far stands to the credit of Wm. Bumaker, of Trenton, $31\frac{1}{4}$ pounds; a close second, however, is to the credit of Wm. Harris, of newspaper fame, of our city, an even 30-pounder, taken Thursday night last. I had the pleasure of seeing the beauty landed, and it was as fine a specimen as I ever saw as regards symmetry and coloring.

Bass are, however, remarkably scarce, and the attention of thousands is directed toward the weakfish, which are fairly plentiful along the beach when the weather is favorable and westerly winds prevail. Barnagat is now at its best, and the fish, while not large in size, are very abundant, and good catches are to be had at all times. Bluefish are beginning to take the hook along shore, and are eagerly sought for at the favorite points, which are principally at Deal Beach to the north and Manasquan Inlet to the south.

Some Knowing Dogs.

II.

I SUPPOSE the subject of animal intelligence has been exhaustively treated, and it has been proven that animals possess both instinct and the power to think; but as nobody doubts their possession of the former, and only a few believe animals ever exhibit evidences of actual manlike thoughtfulness, I earnestly desire to add a few of my own observations as to the latter.

In the first place I shall not attempt to prove that any beast possesses a language as complete as that of even a savage tribe of mankind; nor will I deny that certain words or calls are inherited—for certain calls or utterances are purely instinctive with human kind, too. But I do assert and shall maintain, that some animals not only learn words, or calls, of other creatures, but of many other creatures, even of species very different from themselves. Not exactly to imitate the sound (though the parrot and several sorts of birds even do that), but to perfectly comprehend its import, do they acquire the power, and that by observation, just as man does.

Secondly, when they find themselves in situations new and unnatural to them, and probably never experienced by any of their ancestors, they sometimes show unmistakable evidences of thinking, of contriving, and of trying to adapt themselves to the conditions; not always successfully, of course—nor does man always succeed in new situations.

But just here, allow me to observe that, even if we never saw any evidences of animal intelligence, we

could not be sure they lacked it, as we cannot always know their motives for doing or not doing what to us appears the proper thing; nor can we see or understand, to a certainty, their viewpoint of every situation.

No doubt, if they could speak our language, they would often express surprise at what seemed our lack of reason and judgment.

Probably the majority of close investigators will agree that the dog more nearly approaches man in the sort of intelligence under consideration than any other animal—but I do not include hounds, as, in them—I suppose instinct is the most distinguishing quality. What I call intelligent dogs, are Newfoundlands, collies, terriers, spaniels and house and pet dogs of several varieties. And not all of these are remarkably intelligent, either, but mainly those who have kind, sensible, careful masters—which all the more proves their ability to learn, to think. If only instinct controlled them they would be alike—lacking in individuality; whereas, dogs of the same species, or even the same litter, differ almost as much as boys in character and ability. One is brave, gentle, obliging, fastidious, modest—another is timid, yet cross; resentful, selfish, dirty, without love of applause or sense of shame. Still another possesses some of the good propensities and some of the bad. I have been the fortunate owner and companion of at least two dogs—yes, three—each with all of the good qualities enumerated, and possessing many accomplishments impossible of acquirement by any animal incapable of thinking. One of them—a little slate-colored terrier—understood about 200 words in English, besides a dozen or so in other languages. She knew, by name, our most frequent visitors; the names of all the house pets and farm animals, and the household furniture most important; what was meant by "the yellow cat," "the black cat," "the pine tree," "the oak tree," "the hollow tree," and many other things which required an understanding and memory of words. I proved all this many times, by speaking to her in every sort of tone possible, with my back to her, or out of her sight, and in the presence of many witnesses. A history of her accomplishments and remarkable adventures would fill a 12mo. volume of 100 pages, in fine type. I did not, usually, "command" her, but made known my requests in the most polite and gentle manner—which is the correct way with any really good dog, as such are always proud, and once you humble him by unnecessary harshness you lessen his respect for you, and decrease your power over him. When I am too hasty, or make a mistake calculated to humiliate a wise dog (no matter whose dog), I straightway apologize, as sincerely as to a man—and no dog ever failed to forgive me. If you never apologized to a dog, just try it once and observe his unmistakable pleasure. If he is "first-class," he will show a variety of expressions—pleasure at your justice, pride that he is thought worthy, and sorrow for the self-humbling of so august a being as a man—for to a fine dog a man is a god.

The thoughtful memory of a dog may be illustrated by many stories. I will take space here for only one little incident: I had an ugly red dog, of no pedigree, who, in early puppyhood began to evince a fondness for playthings and curios—after the manner of a human child. Now, the odd thing about it was that he kept collecting "toys" until he soon owned a great variety; and, though he scattered them and seldom had them together in one place, he lost very few of them. One of these curiosities was a well-preserved dried frog which he had found flattened under some old shingles where it had been crushed to death. When we first saw him with it he was only a few months old. He tossed it up, caught it, ran away with it, and showed his delight with it in various ways, but did not chew nor tear it. He carried it to the house and returned to the shingle-mill with it, and carried it about, and concealed it in many places, and did so day after day, till near the time of his death (he lived only 3 or 4 years). He could catch any rabbit "on the fly," even in a jungle other dogs can scarcely penetrate (a tiny game preserve I value highly), and often amused himself—and us—by running them down. If he had his dear frog with him when the rabbit "up jumped," I thought, "Now he'll lose his pet sure!" But he always found it again and brought it home.

I desire to relate one instance of thinking in a cat. We had a large yellow cat who could not be trusted in the house—unless the little terrier was present to watch him and keep him out of mischief. One day Mrs. M. gave him a few beans in a sharp-edged lard can lid. He seemed to like them first-rate, and kept his nose down in the tin, eating in the usual cat fashion until only about a dozen remained, and these stuck so closely all around the low, sharp rim that he could neither get his mouth on them nor lick them out with his rough tongue. He was now evidently very hungry and tilted his head this way and that, and moved the tin about, and made many interesting attacks. We watched him, laughing at his comical antics. He seemed on the verge of despair several times, but would only pause a few seconds between his efforts. At times he would look up into our faces with an appealing, human expression. I kept talking to him, telling him to "try it again," but offering no assistance, though I meant to at last.

After a long while he held up his head and sat still, with a sorrowful expression. Suddenly he smiled—as truly as ever a man did—at a happy thought. Down darted his hand (I call a paw a hand when it is used like one), felt carefully under the rim, then returned with a bean clutched in it, which he put in his mouth with a dignity and confidence possibly equal to the bearing of our pre-historic ancestors. Sitting proudly erect, smiling with a look that seemed to say, "Ain't I dandy?" he continued feeding with his hand until the last bean disappeared!—while we stood and laughed until the remainder of the family and the chickens came to view the performance!

If circumstances permit I will at another time relate a string of original anecdotes upon the wisdom and eccentricities of dogs, cats, horses, birds, hogs and wild creatures I have known, and experiments I have made with some of them. I shall always be careful not to exaggerate, but to be "true to nature."

L. R. MORPHEW.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice errors or omissions in the following list, and also changes which may be made in the future.

America's Cup Races, Aug. 20 and alternate days.

AUGUST.

- Moriches, McAleenan cup race.
- 29. Columbia, Lipton competitive cup races, Chicago, Lake Michigan.
- 29. Cape Cod, Y. R. A., open, Provincetown.
- Seawanhaka Corinthian, club, Oyster Bay.
- South Boston, club, City Point.
- Chicago, special, Lake Michigan.
- Beverly, sixth Corinthian, Monument Beach.
- Royal Canadian, club, Toronto.
- Corinthian, sixth championship, Marblehead.
- Savin Hill, club, Dorchester Bay.
- Huguenot, Y. R. A. of L. I. Sound, annual.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent float along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

America's Cup Races.

TUESDAY, Aug. 18, was the day settled upon for the measuring of the two contestants for international honors—Shamrock III. and Reliance. Both of the boats had been in the dry dock at Erie Basin for several days previous, and the crews had been hard at work getting the boats' underbodies in as near perfect condition as possible. Shamrock III.'s entire hull had been painted with a white composition that gave a remarkably fine surface. A bright green stripe at the waterline and another at the deck relieved the otherwise white hull. Reliance's bronze bottom had been rubbed down until it was absolutely smooth and her topsides received a coat of white paint.

Mr. Charles D. Mower, the official measurer, reached Erie Basin shortly before noon on Tuesday, and he was accompanied by Mr. Albert B. Hunt, a member of the New York Y. C., who assisted him in measuring both boats. They had come from New York on Reliance's tender Sunbeam, together with Messrs. C. Oliver Iselin, Woodbury Kane, Herbert Leeds, Newberry Thorne, Butler Duncan, Robert Bacon, Col. Sharman Crawford and Dr. Monahan.

On their arrival both boats' hulls were exposed and each occupied a separate dock. The yard had been thrown open to sightseers and photographers, and there were many on hand.

It was decided to measure the spars of the boats first, and then in the afternoon to take the waterline lengths and, consequently, Mr. Mower began work on Shamrock III. at once. Sir Thomas Lipton and Mr. William Fife, the yacht's designer, were on hand to watch the operation, as were Captains Wringe and Bevis. After Mr. Mower had gotten the length of the boom, gaff and the base of the fore triangle, he went aloft in a bos'un's chair to get the height of the perpendicular, that is, the distance from the boom to the topsail halliard block. Mr. Fife was an interested spectator, and as each dimension was taken he would jot it down on a piece of paper for personal reference. He stated at the time that he wished to change the position of the throat halliard block in order to reduce the boat's measurement, and that he might want a remeasurement on the day following. Such turned out to be the case, for when it came to measuring the spinnaker pole it was found that it was about eight inches too long, and a man was immediately set to work to cut the pole down to the length allowed. There was no representative from Reliance on Shamrock III. when the spar measurements were being taken, nor did anyone from Shamrock III. go aboard Reliance while Mr. Mower was putting the tape on her spars. After

finishing up work on Shamrock III. Mr. Mower turned his attention to Reliance, and it was nearly two o'clock when he had completed his duties.

By this time the water had been allowed to flow into both docks. Shamrock III. was water-borne first, and when Reliance was afloat the gate at the end of the dock was opened and she was warped into the same dock with the challenger. Shamrock III. lay at the head of the dock and Reliance lay well down toward the after end.

The measuring of the waterlines was a most delicate task, and great care had to be exercised in order to get the measurements correct. Mr. Mower started on Shamrock III. The crew was placed to the satisfaction of Mr. Fife and Captain Nat Herreshoff. After this was done Mr. Fife, Captain Nat, Mr. Mower and Mr. Hunt got into a flat bottom skiff, together with two sailors. Plumb bobs had been dropped over the bow and stern, and the punt was pushed up under the bow. The long batten was run under the overhang, and Mr. Fife and Captain Nat watched Mr. Mower with great interest. When the mark had been made on the batten the boat was shoved aft, and the same performance was again gone through. There was a fresh breeze blowing, and even in the basin the water was not quite smooth, and on this account extra care was used in order to get the length of the overhangs absolutely right.

The overhangs on Reliance were measured in a like manner, and Mr. Fife looked after Sir Thomas Lipton's interests here as Captain Nat had looked after Mr. Iselin's when Shamrock III. was being measured. The work was accomplished to the entire satisfaction of both these gentlemen. As the tide was beginning to drop, both Reliance and Shamrock III. were warped out of the dock as soon as the work of measuring was done, and each boat was taken in tow, and off they went to the Horseshoe.

Mr. Fife was under the impression that Shamrock III. would be very close up to the limit of goft. on waterline length, if not in excess of it, and he was relieved to find that she was well inside. Reliance was nearly 6in. longer on the waterline than she was when measured earlier in the season. Both boats were measured with two sets of club topsail spars on board. Mr. Mower painted two marks on both sides of the boats just at the waterline. The boats were measured with the headsails set in stops, as the rule requires.

Shamrock III. looks very small after one has been aboard Reliance, both on deck and below. While the challenger is beautifully built, she is hardly as interesting as would be expected. There are no nevelties or any unusual features in her construction.

Capt. Nat looked Shamrock III. over with Mr. Fife, and then the courtesy was returned when Mr. Fife went aboard Reliance. The two greatest designers in the world looked each other's productions over with a critical eye, yet little or no comment was made on either hand.

Thousands hung around the dock all the time the boats were being measured, and it was not until five o'clock, when the work was finished, that they left the basin.

Mr. Mower gave out the dimensions at the club house on Tuesday night. They are as follows:

	Shamrock III.	Reliance.
Length on load waterline.....	89.81	89.66
Length from after end of main boom to forward point of measurement.....	187.54	201.76
Length from fore side of foremast to forward point of measurement.....	81.4	84.29
Length of spinnaker boom.....	81.4	83.75
Length of main gaff.....	65.77	71.90
Length of topmast: Shamrock 69.15—1.5 less; Reliance, 72.00—1.5 less.....	55.32	57.60
Height from upper side of main boom to topsail halliard block.....	144.83	149.68
Square root of sail area.....	119.74	127.16
Sailing length, as per rule.....	104.77	108.41
Sail area.....	14,337.45	16,169.93
Number of persons on board.....	56	64

Reliance allows 1m. and 45s. to Shamrock III. over a 30-mile course.

This is a little more than Reliance allowed Constitution in the racing this year.

It was not a surprise on Wednesday morning when Mr. Fife called for a remeasurement.

On Wednesday Shamrock III. and Reliance went out for a little spin, but both skippers kept well away from one another. As soon as the mainsail was set on Shamrock III. Captain Wringe found just how much he could shift his throat halliard block. When the boat got back to her moorings Mr. Mower was sent for, and he went down to the Horseshoe on Wednesday afternoon. The change in Shamrock III. make quite a little difference in her measurement. Reliance now has to allow Shamrock III. 1m. and 57s.

First Day, Thursday, Aug. 20.

It was a great disappointment to everybody that there was not wind enough for Shamrock III. and Reliance to finish within the time limit of five and one-half hours on the occasion of their first meeting. While it was not a race, it gave those who went down the bay an excellent chance to get a line on the two boats.

In the early morning the prospects of wind were not good. It was cloudy and the atmosphere was filled with humidity. The thunder squall that took place on Wednesday had not cleared the air.

The crews on both Shamrock III. and Reliance were about early, and about half past seven the crew on the former boat began to remove sail covers and the jib and staysail were sent up in stops. By eight o'clock Shamrock's mainsail was hoisted, and Reliance's crew was busy following suit. The big club topsail was set on Reliance, and everything was put in readiness on both boats for the race.

Just before nine o'clock Reliance slipped her moorings and started down the bay in tow of the tug Guiding Star. On the defender was Messrs. C. O. Iselin, W. B. Duncan, Newberry D. Thorne, Woodbury Kane, Herbert C. Leeds, Dr. Monahan and Captain Nat. Herreshoff. Mr. H. M. McGildowney represented the Royal Ulster Y. C.

As soon as Reliance left her moorings the tug Cruiser took Shamrock III. in tow, and they started for the lightship. On board the challenger were Mr. William

Fife, Col. Sharman Crawford and Col. D. F. D. Neill. Mr. Robert Bacon represented the New York Y. C.

Captain "Lem" Miller, who sailed Columbia all the season, joined forces with Captain Barr, and was aboard Reliance. Captain Bevis, who commanded Shamrock I. was on Shamrock III. to assist Captain Wringe.

Shamrock III.'s big club topsail was set after she got well outside.

At ten o'clock both of the boats had cast off their tows and were sailing around the lightship.

The big tug Navigator arrived on the scene soon after having on board the Regatta Committee Messrs. S. Nicholson Kane, Newbury D. Lawton and Edward H. Wales.

Shamrock III. ranged alongside the committee boat, and Mr. Fife, hailing them through a megaphone, said that through an oversight Shamrock III. had been measured without an anchor and cable on board, which was not as the rules of the club required. The Regatta Committee informed Mr. Iselin of the fact and asked him if he was willing that Shamrock III. should sail subject to a remeasurement at the earliest possible date. This met with Mr. Iselin's approval, and off the boats went. Shamrock III. sailed with her anchor and cable on board, but an equivalent amount of ballast had been removed.

The first race was to windward and return, and just before half past ten signals were set on Navigator announcing that the compass course would be S. S. W. The committee boat had anchored to the S. E. of the lightship. The tug John H. Scully was sent away to log off the course, and a little later the tug Coastwise followed, acting as a guide boat for the two yachts.

At 10:45 the preparatory signal was heard. The wind at this time was S. S. W., and having a strength of not over four miles.

There was a large fleet of excursion boats and steam yachts on hand, and those on board saw but little of the race, for the revenue officers on the patrol and guide boats were over-zealous in their duties, and they kept the attending fleet miles further away from the yachts than was necessary.

The breeze was so light that the skippers on both boats had broken out their baby jib topsails long before the start. The wind hauled quite a little in the few minutes that elapsed between the preparatory and starting signals.

Just as the warning gun sounded Reliance headed N. toward the line on the port tack, crossing Shamrock's bow. The challenger was put on the port tack after Reliance. Both boats had the wind abeam, and Reliance was kept off again across Shamrock's bow. Reliance was moving along smartly and she drew away from Shamrock fast. When the starting signal was given at eleven o'clock both boats were some distance from the line.

Barr and Wringe had kept well away from one another and did not seem anxious to try conclusions. Reliance gybed around the lightship and crossed the line way in the weather berth. Shamrock had started a few minutes ahead of the defender, but she had tacked right on the line, about half way between the committee boat and the lightship. She had no headway on, and what few honors there were lay with Barr so far. The start was very flat indeed.

The boats were timed as follows: Shamrock III., 11:01:14, and Reliance 11:01:47. They crossed on the starboard tack and all the men on both boats were sitting well to leeward in order to give the boats enough list to prevent the ground swell from rolling what little breeze there was out of their sails.

Reliance had more headway on and seemed to draw away from Shamrock fast at the start, but the challenger was kept off and her jib topsail, which was considerably bigger than Reliance's, was allowed to draw well, and she footed very fast. Barr was pinching Reliance, and his jib topsail did not stand at all.

The breeze had freshened a little, but it did not last for long. Shamrock III. was certainly footing faster than Reliance, but she was not pointing so high. No man can excel Barr in sailing a boat to windward, and in the conditions that prevailed at this time he was working his ship out slowly but surely.

Clouds had been banking up in the W. since early in the morning, but they indicated more rain than wind. A half hour after the start Reliance was well out to windward of Shamrock, and Wringe ordered their jib topsail taken in and another smaller one set in its place. Some 3 minutes was consumed in making this change. This sail was even larger than the one carried on Reliance.

At 11:30 the squall broke, and it rained very hard for half an hour. The rain hid the yachts from view, and when it subsided somewhat, about noon, there was a little more wind, and the boats moved along with more life.

Shamrock was seen to be some distance ahead but not far enough to cross Reliance's bow should she tack. Then it began to rain in torrents again, and it came in thick, and the boats were again obscured from view.

When the second shower was over it was seen that a shift of wind had given Reliance a nice lift, and she was over a quarter of a mile to windward of Shamrock.

At 12:19 Shamrock was put on the port tack, and when the yachts came together Reliance crossed Shamrock's bow. Barr tacked on top of Shamrock, but the challenger had her wind clear, and Wringe rapped her off, and she pulled out through Reliance's lee.

At quarter of one Shamrock was put on the starboard tack. Again the boats came together, and Reliance crossed Shamrock's bow, but by a smaller margin than she did the first time. Reliance tacked on Shamrock's weather bow. Shamrock soon went about, and Reliance followed a few seconds later. The breeze was very light, and at 1:23:50 both boats were put on the starboard tack.

Just before 1:30 the baby jib on Reliance was taken in and another larger sail was set in its place. The same change was made on Shamrock. The guide boat was seen off to the southward, and the mark could also be made out, the cone flashing at intervals. Just before two o'clock Reliance's staysail was taken in

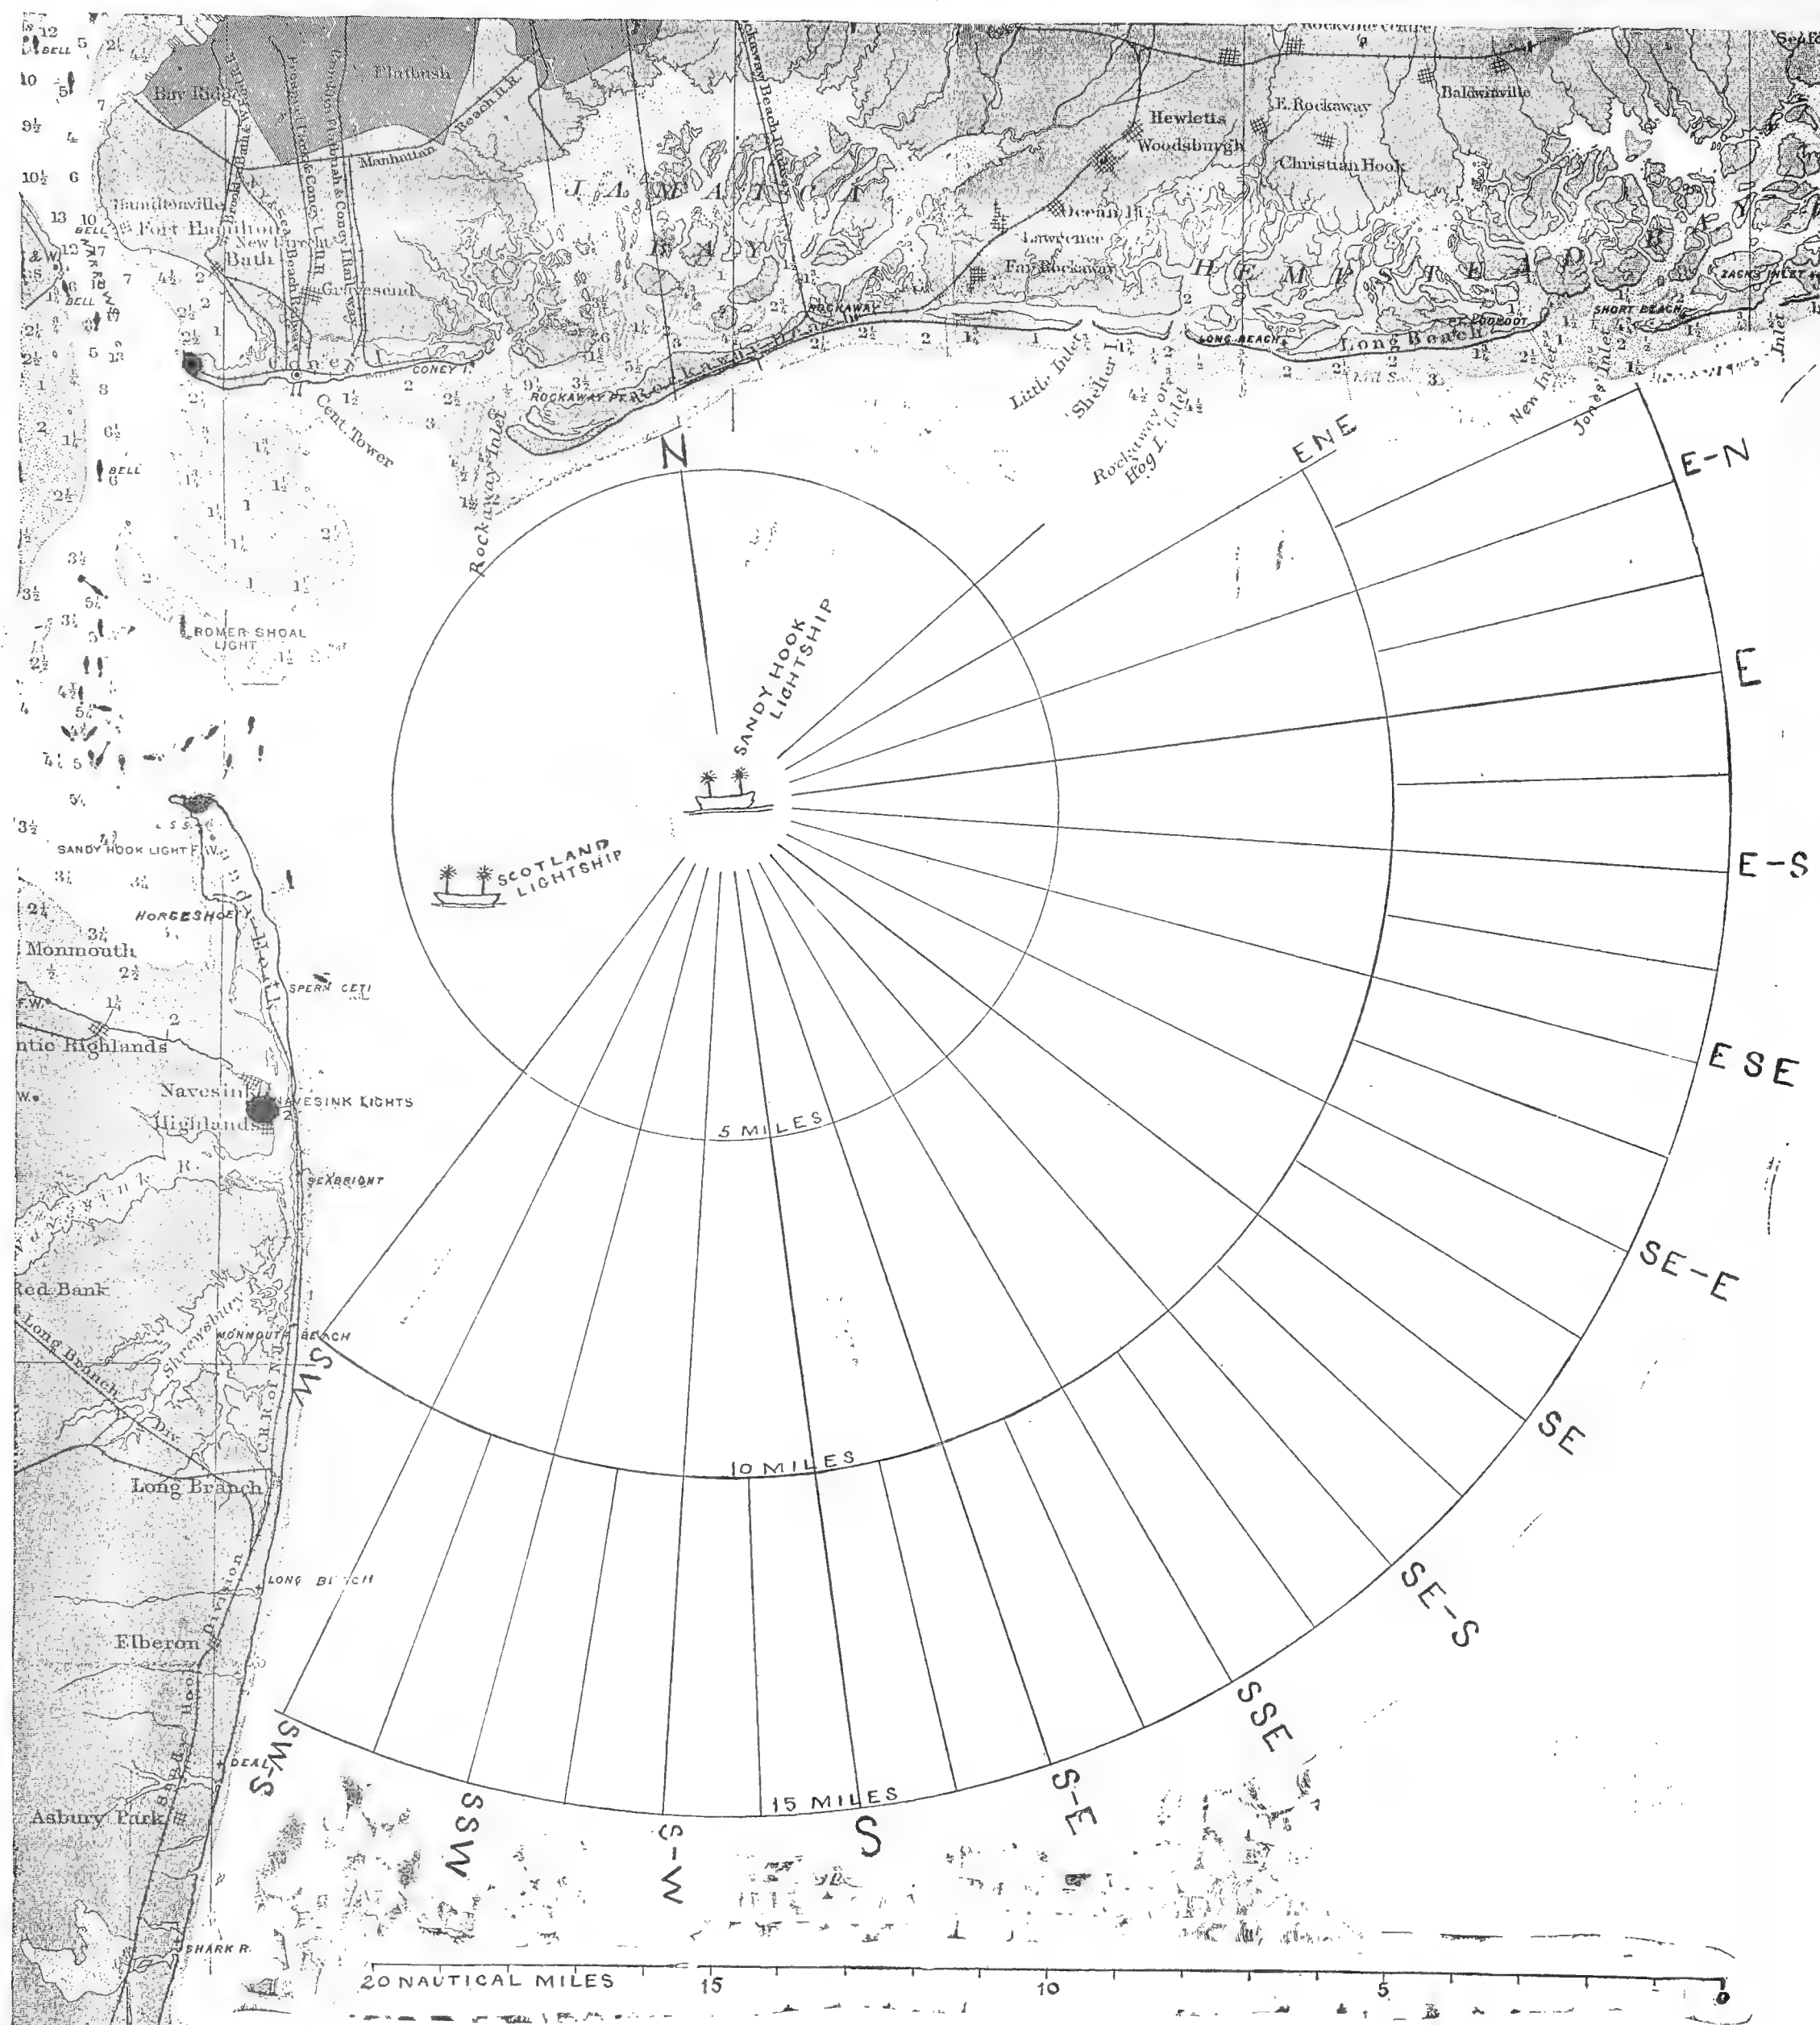

CHART OF THE AMERICA'S CUP COURSE.

and a balloon fore staysail was set flying in its place. This sail appeared to do some good, and after Shamrock had been headed off by the ever changing breeze her jib topsail was taken in and a small balloon jib was set in its place. As soon as the sail filled out her jib and staysail were taken in. Of course she was headed away off her course in order to keep the big sail full, but she undoubtedly gained by the change. About 2:15 Reliance took in her jib topsail and 4 minutes later she broke out a small balloon jib and took in her jib and staysail. This was the first time that the contestants in an America's Cup race had ever used a balloon jib with which to beat to windward.

Reliance continued to improve her lead, and the big sail lifted her flat bow over the long ocean roll. Reliance held a better breeze than Shamrock did, and she was moving along at a fair clip, while Shamrock was almost becalmed.

Reliance took the port tack and stood in toward the Jersey shore lee bowing the tide that runs along the beach. Reliance worked into a nice little air from the N. W., which enabled her to lay her course for the mark. As the defender came up to the mark her working staysail was set. When she had the mark abeam, her balloon jib was quickly taken in, and she rounded at 3:37:30. Her jib was set, and she was put on the port tack. Shamrock was a long distance behind, and it would probably have taken her eight minutes to round. Shamrock finally caught the puff that had

helped Reliance around the mark, and she began to move along at a good clip. It was quarter of four when Reliance passed Shamrock, and the latter boat took in her balloon jib topsail, set her headsails, tacked and started on after Reliance. As there were only forty-five minutes before the time limit expired, there was no chance of finishing the race, and Shamrock gave up, as she did not care to go on and round the mark fifteen minutes or more behind Reliance.

At ten minutes of four Reliance signalled the tug Guiding Star, and she was taken in tow. Her club topsail was sent down on deck. Shamrock III. was also taken in tow, and the race was off for the day.

First Race, Saturday, Aug. 22.

It was fifty-two years ago to-day that the schooner America won the America's Cup off Cowes. Aug. 22 appears to be a red letter day for the American boat in races for the Cup, as Reliance distinguished herself by beating Shamrock III. 7m. and 3s. in a fresh breeze.

The morning held out every prospect for a good race. There was a rattling breeze blowing from the S. W. that gave every indication of holding throughout the day.

The crews of Shamrock III. and Reliance were aboard their respective boats early, and all were elated over the prospect of a good race. The amateurs were also on hand early.

All day Friday a crisp N. W. wind blew, and it took all the dampness out of the yachts' sails, and they were in good condition when they were hoisted on Saturday morning. Reliance's mainsail went up two feet higher than it did on Thursday, and it set perfectly. If anything, Shamrock's headsails were a bit better than Reliance's, but both were good.

Reliance was towed out by the tug Guiding Star, and Shamrock was brought out to the line by the big tug Cruiser. Reliance set an intermediate club topsail when nearly out to the lightship. As soon as the sail was in place her tow line was cast off and she began jogging around the lightship. Shamrock III. was under lower sails when she was dropped by Cruiser, and those on board waited some time before sending a club topsail aloft. The one selected was larger than Reliance's.

The S. W. breeze had a strength of ten or twelve miles, and there was a lump of a sea on. With the wind from the S. W., the Regatta Committee found it impossible to lay a fifteen-mile and leeward course from the lightship, so a signal was set on Navigator announcing that the starting line would be changed.

Navigator steamed off to the eastward, and the yachts and excursion fleet followed. After going five miles E. from the lightship, Navigator signalled the tug Unique to anchor, thus marking one end of the starting line. Then Navigator took up her position to the S. E. of the mark boat Unique, making the starting

line. After Navigator had taken up her position signals indicating that the compass course would be S. W. were set.

It was noticed that Shamrock's club topsail was not standing at all, and it was finally sent down on deck and another sail was sent up in its place. This one was about the size of the sail carried by Reliance.

The start had to be postponed, owing to the change in the starting line, and it was 11:30 when the preparatory signal was given.

About three minutes before the starting gun Shamrock was headed for the tug Unique, located at the N. W. end of the line, Reliance being at this time about three lengths behind. After passing to the W. of the mark boat Shamrock gybed, Reliance following suit and stood on after her. Shamrock was kept off, and Reliance came up on her. Then Shamrock was headed up and she crossed the line just on the gun, luffing sharply to avoid hitting the committee boat. Reliance was behind and to weather of the challenger. The times at the start were: Shamrock 11:45:17, and Reliance 11:45:21. Both boats were on the starboard tack.

A baby jib topsail was set on Reliance soon after crossing, and the challenger followed the example set by the defender.

Headed as they were, the boats were catching the seas under the weather bows, and it was shaking them up somewhat. Shamrock was sailing a truer course than Reliance, and was unquestionably improving her position. After carrying her jib topsail for about a quarter of an hour she took it in and appeared to do better without it.

Shamrock was sailing like a witch, and was bettering her position all the time. At 12:11 Barr put Reliance on the port tack because she was getting back winded by the challenger, and because the wind had shifted a point and a half, and the Jersey shore is the place to be when a S. W. wind begins to shift.

Two minutes after Reliance tacked, Shamrock followed. The jib topsail was taken in on Reliance, and she did not feel the sea so badly on this tack. At 12:40 the defender was put on the starboard tack, and the two boats drew together. There was considerable speculation as to whether Shamrock would cross the defender's bows, but Reliance on the starboard tack had the right of way. Wringe found he could not cross Reliance, so he took a starboard tack. Reliance was out on Shamrock's weather quarter, and the boats were in relatively the same positions they were when they crossed the starting line.

The sea did not seem to bother Reliance as much as it did at the start, and she did much better without her jib topsail. At two minutes past one Wringe put Shamrock on the port tack, and Reliance was also put about at once. Shamrock was now on Reliance's weather quarter. Shamrock was getting Reliance's back wind, and Wringe found it advisable to tack to starboard. After holding this tack for a little over a minute she was about on the port tack again. As the boats worked inshore, Reliance found the smoother water more to her liking, and moved along very fast.

At 1:25 a baby jib topsail was set on Shamrock, and less than a minute later Reliance's sail was set and drawing. The wind was letting up a little, and these little jib topsails did considerable good.

About this time the mark was sighted, and Reliance could lay her course for it. Shamrock had overstood a little, as she had taken one more starboard tack than Reliance, and her sheets were checked.

Just at this time the wind chopped around to W. S. W. This headed Reliance off, but Shamrock suffered much more, for it put her behind after she had occupied the weather berth.

Reliance was put on the starboard tack, and after two minutes was put back to port again. Reliance crossed Shamrock's bow by a good margin. The defender was put on the starboard tack at 1:50, and Shamrock followed just a minute later.

When Reliance was well up on the mark her baby jib topsail was run down smartly and her balloon jib topsail was sent up in stops. Everything went like clock work on Reliance, and cleaner work has never been seen on any boat. The main sheet was eased off, the balloon broken out and the spinnaker pole lowered to port. The spinnaker was set and drawing in a little over two minutes after rounding.

Reliance rounded at 1:55:17 and Shamrock at 1:58:34. The work of handling sails at the mark on Shamrock was noticeably different from that on Reliance. The spinnaker was hoisted and broken out before the balloon was lowered and reset flying, for there was a turn in the sail when hoisted the first time. Much time was lost in this way. The spinnakers acted badly on both boats at the start, but were soon gotten under control.

Reliance's spinnaker was so trimmed as to spill the breeze into her balloon jib, and the two big sails were pulling all the way back to the finish line. Shamrock's spinnaker was not trimmed so well and her balloon jib did not begin to do the work Reliance's did.

On Reliance the jib and staysail were taken in on the run home, but on Shamrock her jib was kept in place.

On the way back Shamrock's spinnaker caught in the spreader, and it tore quite a rent in it. The tear did not get any worse, however. Reliance ran away from Shamrock on the way back to the finish line. Her larger sail area made a tremendous difference in running, and she swept across the finish line the easy winner at 3:17:38. Light sails and jack yarders were taken in on both boats, and they were towed back to their moorings. The summary:

	Start.	Finish.	Elapsed.	Corrected.
Reliance	11 45 21	3 17 38	3 32 17	3 32 17
Shamrock III.	11 45 17	3 26 34	3 41 17	3 39 20

Reliance beats the Shamrock by 9m. elapsed time, and 7m. 3s. corrected time.

The following table shows the elapsed time for the fifteen-mile beat to windward:

	Start.	Turn.	Elapsed.
Reliance	11 45 21	1 55 17	2 09 50
Shamrock III.	11 45 17	1 53 24	2 13 17

Reliance gained 3m. 21s.

IRONDEQUOIT—CANADA'S CUP CHALLENGER.

The elapsed time for the fifteen-mile run back to the finish is shown in the following table:

	Turn.	Finish.	Elapsed.
Reliance	1 55 17	3 17 38	1 22 21
Shamrock III.	1 53 24	3 26 34	1 23 00

Reliance gained 5m. 39s.

On Sunday morning the two Shamrocks were towed from the Horseshoe up to Erie Basin, where the challenger was put in the dry dock. Her bottom was scrubbed, but it had not fouled up any. Monday at nine o'clock the dock was filled and Mr. Charles D. Mower again measured the boat's waterline and also her boom. There had been some question as to whether the sail did not project beyond the end of the boom when the boom slide was pulled well out. The waterline was found to be about one quarter of an inch shorter than before, but this was accounted for by the fact that Mr. Fife removed a little more ballast than the anchor and chain weighed. The measurements were practically the same as before, and there will be no change in the time allowance that Shamrock III. gets from Reliance. The length of the overhangs were learned and they are as follows:

Length on L. W. L.....	89.78ft.
Overhang forward	21.30ft.
Overhang aft	23.34ft.

134.34ft.

Much criticism had been made about the mainsail in Thursday's race, but Mr. Fife remarked that it was a very satisfactory piece of canvas.

Second Race, Tuesday, Aug. 25.

The second race was sailed over a 30-mile triangular course to-day and Reliance won by 1m. 19s. corrected time.

Newport Special Thirties.

NEWPORT, R. I.

Tuesday, Aug. 18.

Carolina beat four of the other boats in her class in a race sailed on Tuesday, Aug. 18, in a light S. W. breeze. The course was from Brenton's Cove to and around the Compass Buoy. Carolina was first over the starting line and led all through the race. The summary:

	Finish.	Elapsed.
Carolina, P. Jones.....	5 03 02	1 40 02
Raccoon, J. R. Drexel.....	5 04 23	1 41 23
Barbara, W. Rutherford.....	5 05 48	1 42 48
Breeze, W. G. Roelker, Jr.....	5 07 17	1 44 17
Vaquero III., P. Whitney.....	5 18 13	1 55 13

At the annual meeting of the Sea Cliff Y. C., held a short time ago, the following officers were re-elected: Com., Theodore W. Sheridan; Vice-Com., Charles E. Silkworth; Sec., C. S. Chellborg; Treas., C. S. Dunning; Trustees for three years, Charles Berner, Francis Foerster; Trustees for two years, Joseph Kling.

Monday, August 24.

Five of the 30-footers and a like number of the 15-footers sailed a race on Monday, August 24. The wind was light from the S. W., and the boats covered a windward and leeward course. It was a down-the-wind start, and Carolina was first around the leeward mark, and she won by 30s. Minnow won in the 15ft. class. The summary:

30-footers—Start, 3:26.			
	Finish.	Elapsed.	
Carolina, P. Jones.....	4 57 04	1 31 04	
Raccoon, J. R. Drexel.....	4 57 34	1 31 34	
Breeze, J. G. Roelker, Jr.....	4 59 58	1 33 58	
Barbara, W. G. Rutherford.....	5 02 36	1 36 36	
Vaquero III., P. Whitney.....	5 04 11	1 38 11	
15-footers—Start, 3:31.			
	Finish.	Elapsed.	
Minnow, H. Lippitt.....	4 51 09	1 20 09	
Hawk, W. Gammell.....	4 52 03	1 21 03	
Whisper, Master Morgan.....	4 54 49	1 23 49	
Eaglet, Miss Grosvenor.....	4 57 46	1 26 46	
Yo San, F. A. Plummer.....	5 00 54	1 29 54	

Chesapeake Bay Y. C.

CHESAPEAKE BAY, MD.,

Saturday, August 8.

The seventeenth annual open regatta of the Chesapeake Bay Y. C. for Chesapeake canoes was sailed on Saturday, August 8, starting off Toun Square, Oakland, at mouth of Tred Avon River, thence to Beacon's Point Light, thence to Castle Haven buoy, thence back to light, thence to Cook Point Buoy, back to light and return to starting point. Distance, 17.320 nautical miles. Time allowance, 8.66 seconds per inch for above distance measured on waterline. Wind S. E., hauling to S. Boats entered: John B. Harrison, sailed by Capt. Hinnaman; Island Blossom, sailed by Capt. Gibson, and the Parson boat.

	Length.	Start.	Finish.
Harrison	35 6.7	1 05 41	3 46 21
Blossom	31 3.4	1 06 13	3 53 32
Parson	29 0	1 06 25	Upset.

Blossom's time allowance 7m. 24s.; Harrison ahead in elapsed time 6m. 39s. Blossom wins by 45s.

Blossom also wins a leg in service of silver presented by the club. Harrison also holds a leg won in last year's regatta. Silver must be won by a boat three times, not necessarily in succession. The Island Blossom won the anchorage cup presented by General Charles A. Chipley, sailed for under the same conditions as the present service of silver.

Erie Y. C.

ERIE, Pa., August 22.—Only five boats started to-day out of about twenty-five of one class and another that lie at anchor here in the club's basin; the rest seem not to want any races.

The wind that had been blowing half a gale all day from the southwest and west only held until the start, then nearly died out, after bringing a light rain for the boats to finish in. Another race two weeks from to-day finishes the series. The Iroquois, which has held the lead in the 30ft. class, was beaten to-day by the Mingo, which is an old boat, while the Iroquois is a new one.

The Una of the 30ft. class attempted to cross the bow of the Mingo while rounding the stake boat and just escaped a collision, its captain afterwards filed a protest but it was not allowed; he seemed to be in the fault himself if anyone was.

No official time was taken, but the seven-mile course was sailed in 1h. 20m. CABIA BLANCO.

Canoeing.

Prizes for Canoeists.

In order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of **FOREST AND STREAM** offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First, \$50.00.

Second, \$25.00.

Third, \$15.00.

Fourth and Fifth, \$10.00 each.

Sixth to Eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents

and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, N. Y., on or before December 1, 1903.

A. C. A. Membership.

THE following have been proposed for membership to the A. C. A.: F. W. Bodwell, Manchester, N. H.; John R. Bowker, Waltham, Mass.

Atlantic Division—Louis Reichert, Carl Moore, Geo. H. King, A. Wenworth Scott and Charles H. Parsons.

Rifle Range and Gallery.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of the Cincinnati Rifle Association on Aug. 16, the following scores were made. Conditions, 200yds., offhand, German ring target:

	222	220	213	212	211	Honor.
Payne	222	220	213	212	211	63
Hasenzahl	221	219	218	214	210	64
Strickmeier	220	217	215	213	209	65
Roberts	214	213	212	212	207	61
Odell	211	208	205	204	202	69
Lux	211	201	194	194	192	64
Bruns	207	206	204	201	195	62
Drube	207	184	177	153	...	55
Hohman	206	200	199	195	192	64
Freitag	197	197	196	189	188	56

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

*Aug. 19-20.—Millvale, Pa., Gun Club's tournament. Wm. Bussler, Sec'y.
 Aug. 20-22.—Kansas City, Mo.—Midsummer shoot of the Schmelzer Arms Co.
 Aug. 22.—Wanderers' Field Day, at Frog Inn, Jamaica Bay, L. I.

 Oct. 26-31.—French Lick Springs, Ind.—First grand tournament of the National Gun Club. John M. Lilly, Pres.

*Members of Western Pennsylvania Trapshooters' League. Chas. G. Grubb, Sec'y, 507 Wood street, Pittsburg.
 **Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

DRIVERS AND TWISTERS.

Mr. D. W. Hallam, secretary of the Dover, N. H., Sportsman's Association, was a visitor in New York last week.

Mr. C. G. Blandford, captain of the Ossining, N. Y., Gun Club, mentions that there are good prospects for his club's Labor Day shoot. Programmes of it will be sent to applicants.

The Sheepshead Bay, L. I., Rod and Gun Club announces that on Sept. 7, Labor Day, it will hold a cup shoot, open to members only, 50 targets, no entrance. Open sweeps also will be shot.

Mr. Alexander McKnight, of Hollidaysburg, Pa., died at his home on Aug. 17, in his 61st year. His death was caused by paralysis. He was a member of the Altoona Rod and Gun Club. In every walk of life he made warm and lasting friendships.

The Spring Valley Gun Club was defeated by the North River Gun Club in a team race, on the grounds of the latter club at Edgewater, N. J., on Aug. 22. There were ten men on each team, 25 targets per man. The scores were 185 to 159.

The Milbrook, N. Y., Gun Club held a shoot on Aug. 22, at which the expert trapshot, Mr. I. Tallman, was present. He broke 98 out of 100 targets, leaving himself a very narrow margin for future improvement, and setting a very high standard for his fellow sportsmen.

Mr. C. L. Kites, secretary of the Springfield, Mass., Shooting Club, calls attention to an error, as follows: "In your fixtures of coming trapshooting events, in the notice of the Labor Day tournament of this club, it should read \$25 added money instead of \$250, as you have it."

Mr. Arthur Gambell's son met with a serious accident recently, concerning which we express our profound sympathy. In a letter to us, Mr. Gambell refers to it as follows: "I am sorry to inform you my boy Lutie has met with another accident. While playing he fell, dislocated his hip and broke his leg between the hip and knee. He is getting along as well as could be expected. This is his sixth fracture."

We heartily wish him a speedy recovery.

Mr. John M. Lilly, president of the National Gun Club, writes us as follows: "We have to announce the first grand tournament of the National Gun Club, which will be held at French Lick Springs, Ind., Oct. 26-31. Targets and sparrows, \$500 added money. For information, programmes and hotel accommodations address Mr. T. Taggart, French Lick Springs, Ind. This is an ideal spot for holding a tournament, the shooting field being forty acres, with sky background. The hotel and casino is one of the finest in the country, and no effort will be spared which will add to the comfort of the guests. We sincerely trust there will be a large attendance."

The ninth annual Labor Day tournament of the Parker Gun Club, at Meriden, Conn., is open to all. The programme provides ten events, alternately, 15 and 20 targets, \$1 and \$1.40 entrance, totaling 175 targets, and \$12 entrance. Competition commences at 9:30. Sergeant system. Rose system, 7, 5, 3, and 2. Targets 2 cents, included in entrance. Shooters may enter for price of targets. Guns and shells shipped to the secretary, Mr. C. S. Howard, prepaid, will be delivered on club grounds free. A palatable event will be the renowned Bristol Sheep bake, deliciously compounded of baked lamb, sweet potatoes, fried sweet corn, etc., grateful to the palate and satisfying to the stomach.

The programme of the Mountaineers Gun Club tournament is now obtainable of the secretary, Mr. P. B. Plummer, 127 East Eighth Street, Chattanooga, Tenn. Mr. Arthur Gambell, superintendent of the Cincinnati Gun Club, will manage. Targets, 2 cents. Shooting will commence at 9 o'clock. The Rose system will govern the divisions of the purses. Manufacturers' agents may shoot for targets. Round trip tickets at reduced rates are on sale. The dates are Sept. 15 and 16. Ship shells, etc., to Mr. Plummer before Sept. 11, and they will be delivered on the mountain. There are ten programme events each day, 15, 20 and 25 targets, entrance \$1.50, \$2 and \$2.50, added money \$7.50, \$10 and \$12.50. High guns for total programme, \$25, \$15 and \$10. Professionals eligible to first and second high guns, but not to third.

The Cleveland, O., Gun Club Company's twenty-third annual tournament, fixed to be held on Sept. 7, has a good programme. There are ten regular events, of which two are at 10, eight at 15 targets, entrance 50 cents and \$1. Total targets, 140; total entrance, \$9. Events 3 and 7 are for merchandise prizes. The fifteen high and five low guns in the ten events will be awarded merchandise prizes. There also are two special events, namely, the 10-man team race between the Akron, O., Gun Club and the Cleveland Gun Club, for the northern Ohio 10-man team championship trophy, presented by the Akron Gun Club, and the northern Ohio 5-man team contest for the championship trophy presented by the Cleveland Gun Club Co. Class shooting in the programme events, 30, 25, 20, 15 and 10 per cent. Manufacturers' agents are welcome, but may shoot for targets only. Magautrap, expert traps and blue rocks will be used. Programmes, etc., are obtainable of Mr. F. G. Hogen, 15 Craw Avenue, Cleveland, Ohio.

BERNARD WATERS.

Chicago Gun Club.

CHICAGO, Aug. 22.—Owing to the fact that a great many of the members of the Chicago Gun Club are at summer resorts at this season of the year, the attendance is rather small compared with what it would be if all members—or at least the greater portion of them—were in the city. However, interest in the sport does not lag, and the attendance is very good considering the season of the year. There is not a dull moment during the entire afternoon, and the boys continue shooting until they cannot see the targets.

Charley O'Brien put in an appearance at the club Saturday, it being the first time his smiling countenance has been seen there for some weeks, owing to the rush of business, which prevented him from joining the boys at the trap.

The race between O'Brien and Willard for first honors in the trophy was a pretty one, O'Brien winning out.

Arthur A. Walters, the genial secretary of the Chicago Gun Club, has been absent from the club for several weeks past, devoting his time to fishing at the nearby lakes, but was out again Saturday with the boys at the trap.

Lem Willard, one of the directors of the Chicago Gun Club, is shooting a splendid pace this season, and has little trouble to land inside the money at all times. His score Saturday was 98 out of 103 targets, and Lem shot poorly at that.

Event No. 1, 25 targets and added handicap, monthly trophy:

Willard, 3	11111111111111111111111111111111	—28
A W Morton, 5	11110111110110111011011111111111	—25

The entrance in the five events totaled \$37.

Ossining Gun Club.

OSSINING, N. Y., Aug. 22.—The accompanying scores were made at the regular bi-monthly shoot of the Ossining Gun Club to-day. Events Nos. 7 and 8 were for the prizes which are regularly offered by the club. Coleman got first and Ball second in the 7th, and in the 8th Ball captured first and Blandford second. These were handicap events; the distance of the shooters is indicated by the figures following the names. Burns stood at 18 yards, with his 16 gauge "pump," which was a little stiff, but then Burns is liable to shoot "way up" at any time without warning. In event No. 9, all the ladies were new at the game and objected to the recoil of any load that would be of any use. The outlook for our Labor Day shoot is good. If any have failed to receive programmes, please send names to the secretary or captain. J. Blandford 2d is 8 years old.

Events:	1	2	3	4	5	6	7	8	9

Fisher	...	23	23	46	Carr	18	7	13	

ON LONG ISLAND.

[illegible]

Hot Springs Gun Club.

HOT SPRINGS, S. D., Aug. 19.—The Hot Springs Gun Club entertained thirty trapshooting enthusiasts very pleasantly. This was the first tournament given by the club, a new organization, but nothing was lacking in the way of management or the usual equipments for the convenience of guests in such an event. The programme consisted of 190 targets daily, sweeps limited to amateur competition, money divided on the per cent. plan, and all shooting from 16yds. The background was rather difficult for one unaccustomed to it, but the boys went right to work and did excellent execution. Harry G. Taylor, who has been making them all go some in the South Dakota circuit this year, ran away from the crowd the first day, making a run of 117 and finishing the day with 187 kills. Harry Gayhart, of Hot Springs, and Riehl tied for second place, with 12 each lost. The Black Hills championship gold medal was won by Ted Ackerman, on a clean score of 25.

The weather was again fine the second day, and many good scores were made, Taylor, Riehl and Carter being at the top in the order named. The general averages went to Taylor, Riehl and Sievers.

First Day, Aug. 17.

Events:	1	2	3	4	5	6	7	8	9	10	Broke.
Targets:	20	15	25	15	20	20	15	25	15	20	173

Griesemer's Tournament.

ALLENTOWN, Pa., Aug. 20.—Griesemer's tournament, his second annual, held Aug. 18 and 19, at the Duck Farm Hotel, was visited by a number of noted shots, among whom were Messrs. Neaf Apgar, Edward Banks, New York; C. F. Trafford, Lebanon; G. W. Fields, H. B. Ten Eyck, North Branch; Frank Butler, Nutley, N. J. The summaries follow:

First Day, Aug. 18.

Events:	1	2	3	4	5	6	7	8	9	10

Second Day, Aug. 19.

High scores were conspicuous in the second day's events. Among the noted shots who participated to-day were Fen Cooper, Mahanoy City; M. H. Ruppel, North Branch; Mr. and Mrs. W. K. Park, Philadelphia, and Lee and Fred Wertz, of Temple. Charles F. Kramlich made the highest average in the amateur class of the tournament, scoring 103 out of a total of 185. The summaries:

Events:	1	2	3	4	5	6	7	8	9	10

Alabama State Shoot.

BIRMINGHAM, Ala., Aug. 19.—The two days of the Alabama State shoot, Aug. 11 and 12, were days of activity on the grounds of the Birmingham Gun Club, under whose auspices the shoot was held. About fifty shooters participated in the first day's competition. Of the amateurs, John Fletcher, of the home club, was first with 187 out of 200 targets, and he was third in the standing of the day. Lawrence was second. The visitors were as follows: W. H. Heer, Concordia, Kans.; J. T. Anthony, Charlotte, N. C.; A. L. O'Connell, Chattanooga; William Brown, Chattanooga; C. W. Goodlake, Dallas, Tex.; Abe Frank, Memphis; Tom A. Devine, Memphis; A. L. Baker, Griffin, Ga.; C. W. Phillips, Cincinnati; John S. Sanders, Atlanta; George H. Hillman, Nashville; Maurice Kaufman, New Orleans; V. S. Vidd, Pensacola; William Yates, Jr., Pensacola; Walter Huff, Macon, Ga.; Eugene Dupont, Wilmington; R. L. Norvell, Monroe, Ga.; B. C. Crook, Memphis; J. N. Hightower, Americus, Ga.; W. A. Long, Columbia, Tenn.; Dr. T. C. Wilson, Savannah, Ga.; Eli Abbott, Tuscaloosa; G. G. Vaughan, Selma; W. W. Cooke, New Orleans; C. N. Morton, Blocton; Al Briles, Blocton; J. M. Muldon, Pensacola; F. C. Ethridge, Macon, Ga.; T. R. Ward, Greensboro; A. Lawson, Greensboro; Jeff Blount, Greensboro; Lewis Williams, Nashville; Andy Meaders, Nashville; A. C. Barrell, New York; P. B. Plummer, Chattanooga; W. G. Bellinger, Gadsden; J. S. Paden, Gadsden.

Shooting at 200 targets each the results were as follows:

First Day, Aug. 11.

Broke. Per C't.		Broke. Per C't.			
Huff	190	95	Briles	171	85.5
Heer	189	94.5	Vaughan	169	84.5
Phillips	183	91.5	Brontes	169	84.5
Hightower	181	90.5	Novell	169	84.5
Kelly	178	89	O'Connell	168	84

Frazier	167	83.5	Yates	145	72.5
E Abbott	165	82.5	Paden	144	72
Broxles	148	74			

Dominion Tournament.

THE Dominion of Canada Trapshooting and Game Protective Association's third annual tournament was held on Aug. 12, 13, and 15, at Woodbine Park, Toronto, and was an unqualified success. The weather was all that could be desired, and the attendance very large, 151 competitors taking part. So far as the writer knows, this is the second largest target tournament ever held in America. It was open to Canadian amateurs only who were members of any one of the seventeen affiliated gun clubs, or who had paid the individual affiliation fee. Had the tournament been an open one the Grand American Handicap shoot at Kansas City in April last would easily have been eclipsed, because over one hundred applications from non-members for permission to shoot were received and refused. The Stanley Gun Club, of Toronto, had charge of the arrangements, which were complete in every detail.

Woodbine Park is the property of the Ontario Jockey Club. It is situated on the shore of Lake Ontario, and was an ideal place for the sport, giving a perfect background. Nearly every club had a large tent for the use of the members, which added to the beauty of the scene. One gentleman from the United States suggested to the writer that it was an ideal place to hold the Grand American Handicap at live pigeons.

Mr. Thomas A. Duff, president of the Association, took the management of the tournament, and was ably assisted by Messrs. Charles T. Logan and Alex. Dey, secretary and field captain respectively of the Stanley Gun Club. These three gentlemen also shot through all events in the four days, and considering the circumstances made very creditable scores.

The handicap was pronounced by every one as the best yet. The history of its adoption is as follows: Mr. W. A. Smith, Kingsville, Ont., produced a sliding handicap system, which was used last year. The distances were from 16 to 22yds., and a competitor who broke straight at 16yds. was compelled in the succeeding event to go back to 22yds., which frequently resulted in an injustice being done. Furthermore, shooters frequently "dropped" for position. The president of the Association set to work to prepare a new system of handicapping, and while engaged at it observed a letter in the American sporting papers explaining a system proposed by Dr. C. E. Cook, secretary of the New London, Ia., Gun Club, and entered into correspondence with him. By the Doctor's system, each competitor had a 3yd. limit, thus a 16yd. man breaking straight would go to 17yds.; straight again, to 18yds. Mr. Duff, however, felt that it would be an improvement to modify this, and accordingly did so, whereby a 16yd. man scoring straight would go to 19yds., 19 to 18yds., 18 to 17yds., and 17 or less would remain at 16. This system was adopted and proved an unqualified success. Mr. R. O. Heikes was so enthusiastic over it that he declared he would endeavor to have United States clubs use it at their tournaments. Any individual or club desiring a copy of the system as used in Toronto will be cheerfully sent one by applying to Thomas A. Duff, Toronto, or Dr. C. E. Cook, New London, Iowa.

Competitors were present from Sherbrooke, P. Q., on the east to Winnipeg, Man., on the west, the five gentlemen (Messrs. Bain, Allan, Carruthers, Hargrave and Miller) from the latter city traveling nearly 3,000 miles to make the round trip.

The trade was represented by Messrs. J. H. Cameron and J. A. R. Elliott, Rolla O. Heikes, John S. Coler, Jr., Capt. A. W. du Bray, Forest H. Conover and R. H. Watson. The Association is under the deepest obligations to these gentlemen for the valuable assistance given. Messrs. Cameron, Cole, Conover and Watson performed the duties of squad hustler, yet withal had time to do missionary work in the interests of their respective companies. Our own "Injun" was here, there and everywhere. No better representative could be found. He also shot through the entire programme.

The high average prize for the first day—a gold badge donated by the Hunter Arms Co.—was won by Capt. J. F. Higginson, of the St. Hubert Gun Club, Ottawa, with 179 out of a possible 200. He was closely followed by Messrs. W. A. Smith, Kingsville, and J. E. Hovey, Clinton, with 176, while Messrs. F. Westbrook, Brantford, and H. Scane, Ridgetown, scored 175 each, H. D. Bates 174, and C. G. Thompson, Sherbrooke, 173.

The high average among the experts was made by Mr. R. O. Heikes, 179, followed by Mr. J. A. R. Elliott, 174, and F. H. Conover, 163.

The office was in charge of Messrs. W. H. Hayes and L. A. Des Rosiers, Ottawa, and Geo. Cashmore, Toronto. They gave every satisfaction.

Annual Meeting.

The annual meeting of the Association was held on Aug. 12, in the magnificent banquet hall of the King Edward Hotel, and was largely attended. Mr. Thomas A. Duff, president, was in the chair, and after calling the meeting to order congratulated the Association upon the splendid work it was doing, and upon the success of the tournament. He bade a hearty welcome to all competitors.

The financial reports, as read by Mr. A. W. Throop, St. Hubert Gun Club, Ottawa, the secretary-treasurer of the Association, was received with applause and adopted. It showed the Association to be in a prosperous condition financially. A new constitution, by-laws and rules were adopted, ordered to be printed and distributed to the various affiliated clubs.

A vast amount of important business was disposed of.

After a spirited contest between Brantford and Ottawa for the next tournament the former city was selected.

The president, on vacating the chair, paid a tribute to Mr. A. W. Throop for the work he had performed, and also to Messrs. Logan and Dey. He announced that he was not again a candidate for the presidency, and called upon Mr. Thomas Reid, of Walkerville, to assume the chair and conduct the election of officers.

Mr. Thomas A. Duff was twice unanimously re-elected as president, and was compelled to twice write his resignation before the meeting would permit him to retire, and not even then, until he had pledged himself to give the Association all the assistance in his power.

The following officers were then elected: President, F. Westbrook, Brantford; First Vice-President, J. C. Cantelon, Clinton; Second Vice-President, D. McMackon, Highgate; Secretary-Treasurer, A. W. Throop, Ottawa. Executive Committee: Thomas A. Duff, Toronto; Capt. J. F. Higginson, Ottawa; M. J. Miller, Winnipeg; P. Wakefield, Toronto Junction; J. W. Aitken, Chatham; C. Hacker, Brantford; W. A. Smith, Kingsville; Dr. R. W. Hunt, Hamilton, and C. J. Mitchell, Brantford.

The executive committee was ordered to provide a suitable testimonial for Messrs. Duff and Throop in recognition of their services.

After votes of thanks to the Stanley Gun Club, of Toronto, and the King Edward Hotel Company, the meeting adjourned.

First Day Aug. 12.

Second Day, Aug. 13.

The feature of to-day was event No. 6, the two-man team championship of Canada, open to members of same clubs and residents of same town, and was won by Messrs. P. Wakefield and G. W. McGill, of Toronto Junction Gun Club. A magnificent silver trophy went to each. These were donated by Charles Shangman, Montreal.

Amateur high average for the day was won by F. Westbrook with 162 out of 180, who took the silver cup presented by the Toronto Silver Plate Co. He was closely followed by Mr. N. G. Bray, Sherbrooke, P. Q., with 155; T. M. Craig, Sherbrooke; H. D. Bates, W. A. Smith, J. E. Hovey and M. J. Fletcher, with 154 each, and G. W. McGill with 153.

Professional high average for the day went to R. O. Heikes with 163, followed by J. A. R. Elliott with 155.

With 100, followed by J. A. R. Emott with 100.

Fourth Day, Aug. 14.

The eight-man team club amateur championship of Canada was won by the Hamilton Gun Club, who took the magnificent silver cup presented by the Dominion Cartridge Co., Montreal.

The grand Canadian Handicap was won by Mr. T. M. Craig, Sherbrooke, P. Q., with 93 out of 100, followed by Capt. Higginson and N. G. Bray, each with 92. Mr. Craig takes the Association's loving cup and gold medal.

The Mail trophy, emblematic of the five-man team club championship of Canada and the championship flag presented by the President, went to the Brantford Gun Club, together with five gold medals.

The individual amateur championship of Canada and the cup presented by the Montreal Rolling Mills Co., was won by Mr. D. Bain, Winnipeg, with 48 out of 50.

The Brantford cigar trophy, presented by Messrs. Stirton & Dyer, London, for high average for the tournament (except team races) was won by Mr. J. E. Hovey, Clinton, with an average of 88.37, followed by Mr. F. Westbrooke with 88.24.

The medal presented by Comptroller John Loudon, Toronto, for high average of representative of Stanley Gun Club was won by C. T. Logan, 78.93, followed by A. Dey, 78.51, and T. A. Duff, 77.85.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, SEPTEMBER 5, 1903.

VOL. LXI.—No. 10.
No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

WORDS.

OVER the word "carcarjou" there has been much discussion, some declaring that it is a French word, others that it has Indian origin. Those who contend for this last, say that it has the same derivation as "quick-hatch," coming from a Cree word *kikwakes*—by which name the wolverine used to be called in the Canadian northwest.

The most common explanation of the word "caribou" is that it is from the French *carre-bauf*, meaning square ox, but Dr. A. S. Gatschet, perhaps our most eminent authority on Eastern Indian tongues, recently showed that it is a Mic Mac word *xalibu*, meaning scratcher, or pawer, from the habit of the caribou of pawing away the snow to reach its food. The change of l to r is too common to need explanation.

Such words as "chébog," one of the names for the menhaden, "chequet," a name for the weakfish, "chogset" for the cunner, "cisco" and "ciscoet" are all of Indian derivation, but of limited range.

Of far wider general interest is the name "hickory," already alluded to, applied to several species of the genus *Carya*, and which seems to come from some of the Virginia Algonquian dialects. Capt. John Smith and others give various words, such as *pawcoliccora*, *po-hickery*, and *pehickery* as the names either of a preparation of food of which walnuts form an ingredient or as names of trees.

All older readers are familiar with the discussion as to the origin of the word "muscalonge." The proper term was at length decided to be *maskinongé*, from the Ojibwa word *maskinonje*, *mask*, meaning ugly, and *kinonje*, meaning fish. The word, as well known, has been used in a variety of forms.

"Moccasin," or, as it used to be called in the Canadian northwest, "skin shoe," belongs to eastern Algonquin dialects of Virginia and New England, and also to the Ojibwa, who used the term *makisin*.

The largest of the deer, the moose, takes its name from the Indians, the Virginia Algonquin calling it *moos*, the Delawares *mos*, and the Ojibwa *mons*. The name is said to mean eater. The Cheyenne term for elk is somewhat similar to this word, or at least it has the same root, being *mo we*. "Wapiti" the round horned elk of America, probably derives its name from the Cree *wapitaw*, "dirty white, grayish" from the color of the animal.

The muskrat, whose common name in Canada is musquash, receives this appellation from the Abnaki *muskwessu*, and the Ojibwa *miskwasi*, meaning "it is red," referring to the animal's color. In the same way our opossum seems to have been named from its color, the reference being to its whiteness or grayness.

The pemmican of the Northwest, a food made of buffalo meat and grease, which none of us are ever likely to eat again, is derived from the Cree *pimikkan*, said to mean a bag full of grease and pounded meat, *pimiy*, meaning grease.

Capt. John Smith, to whom we owe so much of our knowledge of the early southeast, calls the raccoon *aroughcun*, and other writers give other forms, all of them, however, carrying very nearly the sound of our own word.

"Terrapin" is another common word from one of the Algonquin tongues, some of the forms being *torope*, little turtle, *turpa*, tortoise, and *toarche*, tortoise. We have now "taurup" or "torope" on the Long Island shore, as the name of a form of snapping turtle.

"Toboggan," "togue," tomahawk," "totem," and "wampum" are all familiar, as is also wananish, which has been spelled in as many ways as the different forms of muscalonge. This word is said to be a diminutive of *wanans*, salmon, and so to mean little salmon.

A word now rapidly passing out of use is wavy, applied to certain geese in the Hudson's Bay and adjacent

territory. This probably comes from the Cree word *wewe*, which is obviously from the bird's cry, just as is another Indian name for wild goose, *wawa*, been Dertien, the *thirteen*."

Whisky-Jack, the name of the gray jay, or Canada jay, was originally "Whisky John," and this comes directly from the Cree term for the same bird, *wisketjan*.

A good illustration of the way foreign words are brought into the language and given new meanings because of their sound and through ignorance of the original significances, is found in the names of fishes current on Manhattan Island in the early days of New York. In that extremely scarce work, Miller's "New Yorke," printed in 1695, it is related of the natural resources of the province:

"Fish there are in great store both in the Sea & rivers many of them of ye Same kinds as we have in England & many strange & such as are not to be seen there some even with out name except such as was given them from the Order they were taken in as first second third &c."

An explanation of the naming by numbers is found in Benson's Memoir (1825), wherein it is said of the fish in the Hudson:

"A few only will be noticed—some denoted by numbers as their names—the Twaalf, the twelve, the Streaked Bass, and the Elf—the Shad, the name of the Shad in Dutch is Elft, in German Aloft, and in French Alose, all perhaps from the same root; but being pronounced here Elf, the number *eleven*, the number itself possibly came to be considered as its name, and so led to denote others in the same manner—the Drum is said to have

A volume might be written on this subject, but enough has been said to show that the words contributed by the Indian tongues to the English are neither few nor unimportant. While the tracing out of many of these words has been well done for the East, there still remains much work of this character to be done in the West, and especially on the northwest coast.

THE EARLIEST SHOOTING.

IN many States the shooting season opens this week. In the West the hopeful sportsman with wagon and water keg and dogs, drives over the stubbles, looking for the great grouse that used to be so plenty, and in many localities is now so scarce. The prairie resounds with the cracking of the nitro shells, the dogs run themselves down in the hot sun, and some good bags have been made. Now the birds are strong and well grown, and wilder, too, than they were two weeks ago, better able to take care of themselves. If they present a more difficult mark to the shooter, they are a prize better worth having when won.

Back in the East the real opening of the season is still weeks or months distant. To be sure, there are birds in season—the casual sandpeep or the unobtrusive and deprecatory rail. The sandpeep offers slight reward for the gunner, but, because he is so toothsome, the rail is worth pursuing. He is not at all difficult to capture, for usually he gets up slowly and seems to fly away reluctantly. Often the effort of getting up seems too much for him, and he drops down after a few yards' flight, only to be stirred up again by the push pole of the shover.

Rail shooting is a sport for ladies and children; yet because it comes to us at a season when for a long time we have not been able to use the gun in the field, we are most of us likely to wish to have at least one day in the grass with our long-legged friends.

Not so very many years ago in most States, the rail were absolutely without protection. They might be shot at any time and in any numbers. Men began to shove for them just as soon as the wild oats or corn grass commenced to ripen, and thus speedily killed off all the local birds, leaving the meadows bare, until the advancing fall and the cooler nights brought down another flight from the north.

In those days heavy bags were made. A friend recently reminded us of a time when he brought in eighty-four birds, killed after having used eighty-seven cartridges—all he had, and the tide had scarcely turned. The bags of a well-known New Haven sportsman who, we believe, killed 212 birds on a tide on the North Haven meadows, are still remembered there. Happily, nothing of this kind is now possible in Connecticut, the bag being limited to fifty rail.

In view of the easterly storm which prevailed last week, the tides all along the coast should be high and rail shooting should be good all over the meadows.

THE DYNAMITER.

THAT was a sound homily on the public rights in fishing which Judge Smith, of Helena, Mont., delivered the other day when he imposed a fine of \$400 upon a prominent citizen for dynamiting fish. The iniquity of the dynamiter lies in part in the useless destruction he causes beyond the fish he secures for his own use. The fisherman who uses hook and line can kill only such fish as he brings to hand; the netter may, as a rule, if he wishes to do so, set free the small fry and the species he cannot make use of; but the dynamiter wreaks universal destruction to marine life, killing not only the few or many fish he can use for himself, but others which are simply wasted. It is thus impossible for a dynamiter to take from public waters a mess of fish for himself without at the same time robbing others of what belongs to them; and for this reason dynamiting is very properly and almost universally under the ban of the law. This fine of \$400 for dynamiting is, we believe, a record breaker; but if prominent citizens will persist in setting an evil example to the rest of us who are less conspicuous in the community, it is only fitting that the penalties they pay should be such as will teach the rest of us a lesson. One thing as certain as the safe keeping of the America's Cup on this side of the water for another year, is that in the vicinity of Helena, Mont., the dynamiter will not brag of any big fish he may capture in that way.

Fish dynamiting is a practice which often brings its own speedy and terrible punishment. In Florida one day last week another "prominent citizen" went fishing with dynamite in an Alachua county lake. He lighted the cartridge fuse, which went out. Then he relighted the short fuse, and before he could throw the cartridge from him, it exploded and blew off both his hands. Such warnings are by no means infrequent. By reason of the peril to limb and life involved in it, if for no other reason, the use of dynamite for fishing should be forbidden by laws enforced as stringently as the Montana law is when Judge Smith is on the bench.

THE woods of Franklin county, Mass., are reported becoming restocked with deer. The Gazette of Northampton reports that the game park established on the farm of Joshua Hall in Ashfield, in Franklin county, has proved a great success; the twenty-six deer and six elk originally confined in it have largely increased, and, says the Gazette, there are within four miles of the park more deer in a wild state than there are within it. The Massachusetts and Connecticut deer are demonstrating the recuperative qualities of the wild game supply under favorable conditions of protection. There is in both these States a vast territory of wild and partially cultivated land, in every way adapted to the support of a large number of deer; and there is no reason why the future deer stock should not be abundant and permanent.

Freedom from pursuit and from harrying is a condition which makes for increase. The moose and elk put out in the Adirondacks are fully cognizant of their security; they have put themselves on terms of confiding intimacy with the summer cottagers, and come to the kitchen door of a morning for their treat with all the *sang froid* of a Yellowstone Park grizzly making his free-lunch route of the hotel swill heaps.

At this writing, Tuesday, Sept. 1, the sport of international yacht racing as practiced off the port of New York, has degenerated into a dreary, dismal, and irksome waiting for the final race. The foregone conclusion of the defeat of Shamrock III. has been held by all who witnessed the sailing of the first race, or who have read our reports of the races. It is not too much to say that the winding up of the 1903 series will be a relief to all concerned. With this result of Sir Thomas Lipton's third attempt to lift the Cup, and the discouragement into which British yachtsmen have fallen, there is extremely slight probability of any new challenger in the immediate future. The conviction is generally held, both here and abroad, that the America's Cup cannot under existing yachting conditions be wrested from the possession of the United States.

The Sportsman Tourist.

Santa Catalina.

AVALON, Santa Catalina Island, Cal., August 12.—"The Angler's Paradise." That is the way the advertisement read, and the words are enough to start an angler dreaming. His dreams will run to wooded streams in the north; to mountain brooks where pure cold waters dash over the rocks; to deep, black pools where the big trout lurk. The paradise he pictures may include the soul of the gentle Walton; dreaming over a book in some quiet shaded dell beside some soothing stream or penning those quaintly sweet verses still so dear to the heart of anglers. But the thought that there are no trout or trout streams on the Catalina may come to the dreamer and dispel visions in that direction. That it is sea fishing at Avalon brings to us the remembrance of Walton's lines:

I care not, I, to fish in seas;
Fresh rivers best my mind do please,
Whose sweet calm course I contemplate,
And seek in life to imitate.

I made my arrangements to spend a few weeks at Avalon, and those plans were very nearly upset by a picture on a folder handed me by the agent of the company which owns and operates the island. The half-tone reproduction showed six racks loaded with fish and about twenty men sitting within the semicircle formed by the racks; some of the men are armed with what appears to be pitchfork handles. About half a cord of dead fish are stacked in the foreground. The line under the picture reads: "478 albicore, weight, 5 tons. Caught with rod and reel in one-half day at Santa Catalina Island, Sept. 15, 1902."

It is a sickening and a discouraging exhibit. The men look like boatmen. They were probably out for a record and they certainly made one; but it is an enviable one.

"Anglers' paradise" forsooth! I decided to come over here anyway, for there is always the hotel veranda and the white choker and the fashionable hour.

But Avalon is not nearly so bad as the company's advertisement would indicate. In fact, I have been able to cut out the hotel and the choker and have, at times, been able to avoid the "fashionable hour."

Catalina is a delightful place to boat, to swim, to climb mountains and, after a manner, to fish. As for the fishing, it has been "written up" and exploited so that most of the FOREST AND STREAM family know the story, and they may be more interested at this time in a few observations on the general make up of the Magic Isle.

The island of Catalina has a superficial area of 55,000 acres, is 25 miles long and has an average width of 4 miles, being 8 miles wide at the widest and half a mile at the isthmus. As to general appearances, it is very lumpy; some call it mountainous, though the highest peak, Mt. Orizaba, rises but 2,109 feet from sea level. From the sea at almost all points the hills rise straight up from the shore cliffs and are extremely picturesque. At this time of the year the color scheme is much the same as all of dry Southern California, a brownish gray, dry and dusty. Most of the hills have a fair sprinkling of live oak scrub and manzanito bushes, and these greatly relieve the monotony of the scenes. Plentiful sprinkling of cactus are on every hand. A Spanish explorer, Cabrillo, is credited with the discovery of the island, and the date is set as September, 1542, 361 years ago. He is thought to have anchored in what is now Avalon Bay. Cabrillo named the island San Salvador, thus showing his lack of versatility, and sailed away, and the name didn't even take. Vizcaino got here in 1602, and ignoring Cabrillo's efforts, called it Santa Catalina, got rid of a thumping quid, drank a hearty bumper to the new island, and sailed away. This time the name stuck. Phillip III. of Spain gave the island to one of his generals, who never proved up his papers, and eventually Mexico granted it to Don Pio Pico, the last Spanish governor of California. Pico one day needed a horse and saddle more than he needed a barren island in the Pacific, inhabited sparsely by rude and uncouth Indians, he made a deal with Nicolas Covarrubias of Santa Barbara; then a lawyer of that town by the name of Parker, got possession. He sold out to James Lick, of observatory fame, who later sold it to George Shatto. Mr. Shatto laid out the town of Avalon, held an auction sale of lots, built a portion of the present Hotel Metropole, and on the strength of a wonderful showing of the mineral richness of the island, sold it to an English syndicate for the consideration of \$400,000. The syndicate, after paying almost \$100,000, discovered that the mines "pinched out," and they refused to make other payments. The Banning Brothers, seeing the possibilities of the place as a resort, opened negotiations with the syndicate and with Shatto, which resulted in the transfer of the island to them.

About 160 lots were sold by Shatto, but the Messrs. Banning have succeeded in buying up 80 of these, so they now are virtually the sole owners of the island. It is to be hoped they may succeed in their efforts to get possession of the remaining lots. Their excellent management of the transportation system and in fact of everything their company controls, leads one to wish them success. It is through them and the "Canvas City" plan that thousands of us are able to "dodge the piazza, the choker and the fashionable hour. Some day the Bannings will cut out the Coney Island appearance of the front street of Avalon. Some day all the unsightly stores, shops, stands and shake down shacks that disfigure the town will all be torn down; a boulevard 150 feet wide will be built there, a sea wall, wide and deep, stretch around the magnificent sweep of the bay. Some day a great casino will stand at about the center of the curving horseshoe, and there will be a great bridge from the casino to the broad marble steps, which will let the multitudes who come here for their rest and recreation, down to the waters edge, and to boats and launches; there will be a sand beach, and there will be no garish, unsightly bath house, nor ghast-

ly fish racks with their horrid array of butchered and imported victims, offensive to sight and smell. But the Bannings cannot crowd the millenium. Then, too, they are not yet posing as philanthropists. When all this comes Canvas City and Island Villa may go, and then what of the thousands who now come here because they can tent and not cook; where one big kitchen hidden somewhere furnishes forth hot meats and a great variety of vegetables and food for the multitude?

There are something like 10,000 people on the island now; 8,000 of them are tenting to-night. Canvas City alone has about 700 tents, Island Villa 300 more, and there are about 600 private tent houses here. It is the most orderly and quiet city I ever saw. It is the easiest place on earth to police, and those who might do a wrong fear most banishment from the island. We have macadamized streets, rolled and sprinkled while we sleep; electric lights on all corners, and in our tents, water piped to the door, and the most improved sanitary system; scavenger wagons daily and no scraps of paper escapes the vigilant eye of the man with the rake. Every inch of the ground is covered and cleaned daily, and the system never seems to slip a cog. No city in the world can be cleaner or more sanitary than our own Canvas City. So-called tent cities are everywhere, but nothing like this. As for shade, the streets are all lined, both sides, with eucalypts of several years' growth, so that every tent is shaded and every tent has from two to five trees from which swing his hammocks. From the top of the nearby hills a view of our town shows only here, and a glimpse of the white and blue canvas, so thick is the foliage of the eucalypts. Streets are named, tents are numbered. Tents are furnished or bare, you order what you want from the office; pay for what you use. You can get anything from a needle and thread to a gasoline stove. It isn't roughing it; it isn't what we have been used to in the Maine woods, but it's tenting and we are fishing and swimming and climbing mountains, and it cuts out all the hotel and summer resorts.

One slight drawback, however, should not be overlooked. Our drinking water, distilled, costs us 12 cents a gallon, and is about the only expensive necessity on the island. The hydrant water, pumped to a reservoir high among the hills, is so full of iron and magnesia that it cannot be used for drinking purposes, and so "hard" that soap curdles in it. I am told that the company has two wells under way, and that one of them is now an assured success, so that next season we shall have good home manufactured water.

The fishing here is all judged by the hard test of results. Izaak Walton's ideas are all reversed, for he was

"As well content no prize to take
As use of taken prize to make."

Here it is numbers and pounds, and how quickly they are brought to gaff. It is butchery and waste.

"Fish for photographic purposes only" seems to apply to the greater number of the fishers.

But there are gentlemen and anglers who come here to take their tuna, jewfish, yellowtail and white sea bass, who are sportsmen and do not fish for the camera. They are in one class. "Senor X." gives us, from time to time, good accounts of the doings of these gentlemen, and I have no desire to poach on his grounds. Then there is the man out for a record. He doesn't care how many fish he destroys just so he makes a good camera record, but he is not always a killer. There, too, is the jay with a hard hat and a standing collar. He and another of his sort have come over for two or three days, they dig up the price of a launch for half a day, and depend on the boatman for tackle, and calls the rod a pole. Once on the water, a system of coaching by the boatman and a lift and a turn of the reel now and then from the same gentleman, a strong arm drag for ten minutes on the heavy tackle; a killing rip of the gaff and the Rube has "caught a yellowtail." He has not soiled a glove nor sweat his high collar. Inside of twenty-four hours he is back to the ribbon counter with a mighty tale to tell.

Next we have the rowboat crowd, and they are all of the good-natured sort. Its mostly a handline outfit, a good many women and children. They know nothing of rod nor reel, though occasionally one may be seen fishing with a "pole." But they are out for fish to put in the pan, and they get them, too, good, old rock bass, from half a pound up to 8 pounders, and the earnestness with which the fair dames yank them over the side is intensely amusing. This class, however, never get so far from home as the game fishing grounds. I saw a lady hoist from the deep a measly slimy sculpin. Instead of the indignation, horror and disgust I expected to see, her face showed only joy and exultation.

On the Massachusetts coast she would have at once been the subject of ridicule; here she was congratulated. I found they were considered a delicacy here, and one lady who wore a pink sunbonnet and brown gloves, smilingly assured me she had caught three "scorpions," and she held up three red sculpins, the monstrosities of the sea fish family.

The sand dabber is in a class of his own. He has a wooden reel as large as an old-fashioned well windlass, and about 500 feet of cod line, a dozen or two bass hooks and a modicum of fresh yellowtail for bait. He goes out to a given spot three miles from shore—he carefully conceals the chosen place. There he lowers his line weighted with ten pounds of lead, and after filling his pipe and puffing for ten minutes, he gets his basket ready and winds up his line and removes from one to a dozen sand dabs. The sand dabs are an excellent pan fish, range from 5 to 8 inches long, and weigh about five to a pound, and always bring a good price on the market. The dabber frequently brings up a large, flat sole, which looks like the grandfather of the sand dab, both being of the pinkish white family of flat fish, which lie flat on the bottom and appear to be unfinished on the lower side. The Spanish mackerel are mostly taken by the inshore rowboat people, and though they run small, seem to be popular. Strings of fish are frequently seen containing rock bass, mackerel, sculpins and now and then a kelpfish, the latter being readily recognized by his close resem-

blance to a piece of detached kelp, the glistening brown of his sides and a fragment of the giant sea weed are strikingly similar. His dorsal fin ran from the head right back and around the fish continuously to the gills on the under side. The kelp fish I saw weighed about three-quarters of a pound, and were 11 inches in length; Mexican Joe said they were "very fine to eat." No barracuda are now taken, or I have been unable to see any at close range. They are said to resemble the great northern pike. I saw one from a glass-bottom boat, he appeared to be about 30 inches long, handsomely marked—perhaps reticulated—and from the manner the blue perch, green bass and other fish were literally taking to the tall grass, he is probably of the pike-pickrel ilk. Sheephead, 20 and 17 inches long, weighed 8 pounds and 5¼ pounds; red, long, protrusive teeth imperfect dentistry and repulsive as to countenance; instantly recognized as sheephead by form of head and teeth; food fish. Whitefish—taken in seine, 18 inches, 8 pounds, excellent and popular food fish. Blue sea perch—1 pound to 2 pounds, taken in seine; food fish; myriads of them over marine gardens and almost everywhere except where game fish live, jump like mackerel, but I could not tempt any to take bait. Bonita—took our smelt while trolling for yellowtail; weighed but 17 pounds; came right in, and, as the name indicates, was very pretty; in fact, the smooth skin stretched over his round, hard tapering body showed most beautiful iridescent coloring, running from white to turquoise; thrashed the bottom of the boat 1,000 whacks to the minute; died quickly and made very poor food, being dark and strong. Saw bonita up to 18 pounds. Not many are being caught.

The flying fish are very interesting, length about 12 inches, weight of a dozen of them about 15 ounces each. They are very pretty when first caught, and are valued as food fish, but more highly prized because they are the tuna bait. In times when they are plentiful they sell two for two bits, but when they become very scarce and the tuna are running at the full height of the season, they have brought as high as \$5 apiece. They are taken in seines and make good yellowtail bait, but are seldom used because the smelt and sardines, if fresh, make good yellowtail lure.

The flying fish, as seen from the steamers, are a constant source of delight to the passengers, and are a diversion that makes some of them forget the mal de mer they have long in advance decided to experience when crossing the channel. The fish burst from the water so suddenly that one can scarcely say how it is done, but they seem to be in full flight as soon as they are in the air. They are capable of at least 15 knots an hour, judging from the way they left the steamer, and I saw one make a flight of a quarter of a mile. They soar and have perfect control of their movements in the air, turning and forming great semi-circles in their flight. I saw none of them rise over six feet from the water, and some flew so low that their tails, which are slightly lower than the body in flight, cut through several blue waves before their plunging splash showed they were momentarily weary of playing the bird. Most of them rose near the bow of the steamer, probably thinking they were pursued by some huge enemy, and flew parallel with and then ahead of the boat, usually curving far away in their flight and almost invariably flew at best 100 yards, and one or two, I feel sure, covered a distance of half a mile in the air. The body of a flying fish is long and slender and seems rather square, that is, a distinct corner shows where the sides meet back and belly. The color scheme runs from blue to white, the back being a very dark blue, the sides ranging from a light blue to white, and, in life and flight, glistens like polished silver, belly pure white. Some of them arose from the water, and in turning from the ship showed such an expanse of white and such rapid motion of wings that it was almost impossible to realize that it was not some startled sea bird arising from the waves. The wings are filmy, white, tough skin, stretched over hard spines and are about 6 to 8 inches long and 2½ to 3½ inches at the widest part, and do not look to be capable of sustaining the fish in flight. The method seems to be a quick flapping, somewhat labored and then long, luxurious soaring, more flapping of the glistening wings, more soaring, etc., until the awkward belly-fish dive back to the briny deep. The flying fish has the unhappy faculty of not looking like his photograph, so I shall not try to illustrate him.

The school of whales the advertisements play up so strongly, did not materialize. The transportation company should be compelled to hang up a sign, "No school to-day."

The game fish are as follows, the order being that used by the Tuna Club, shows the relative esteem in which the fish are held: The leaping tuna, black sea bass (Jewfish), white sea bass, yellowtail, albacore, rock bass, sheephead, white fish. This is not a tuna year, and so far but four tuna have been taken, the largest weighed 144 pounds, and may be the record for 1903. They were all killed at the first of the season, early in June. I have been waiting a month and there are no tuna yet in sight. They are believed to be "outside feeding on mackerel," and are daily expected to come in. Col. C. P. Morehouse, of Pasadena, holds the record for the largest tuna—251 pounds—taken in 1900. The Tuna Clubs offers a magnificent cup to the angler who holds the record for three successive years. The cup will likely remain in its glass case for some years.

Quite a number of black sea bass are being taken. About four per day are being brought in. They range in weight from 150 to 415 pounds, one of the latter weight being taken by Dr. Tibbitts a few days ago. This was within 4 pounds of the record fish taken by Mr. H. T. Kendall, of Pasadena, last season. I have been told that Dr. Tibbitts' fish will not be allowed, owing to some technicality. The rules of the Tuna Club do not admit fish taken with the assistance of the boatman or fish taken by a launch having out more than one line for each sportsman.

Yellowtail average close to 17 pounds. I do not know how large the season's fish will run, but the fiercest one I know of cost me 23 minutes' continuous effort, or a minute to the pound, a portion of a thumb

nail and a bruised knuckle. We were in a light rowboat and a choppy sea was running. Mr. R. F. Stocking, of Los Angeles, got his 48 pound yellowtail in 1900 and still holds the record. Dr. Trowbridge's 47½-pound record yellowtail of 1902 gave Mr. Stocking a close run. I want one of those.

No albacore are being taken. Rock bass are gamy, and some I took on a 9-ounce rod gave me excellent sport, but an 8-pounder gave me less enjoyment than my 4¼-pound black bass, taken with the same tackle last summer in a Massachusetts lake.

A few white sea bass have been taken, but I didn't see them. They are said to be good sports. Why sheephead and white fish are classed among game fish I do not know, as I saw none taken except by the seiners.

The Tuna Club conditions restrict anglers to rods not less than 6 feet 9 inches in length, the tip of which must not weigh more than 16 ounces. By "tip" is meant that portion of the rod from reel seat to end of the rod. The line must not exceed 24 threads or strands, and be capable of sustaining a dead weight of not more than 48 pounds. Anglers must bring their own fish to gaff (reeled in), broken rod disqualified.

Very little use is made of the game fish and tons of passably good food fish, such as yellowtail are daily (or nightly) taken out to sea and dumped. And this within fifty miles of a large city where they would be very acceptable to a large number.

There are no restrictions as to catches or seasons. Those who have no savvy as to the fitness of things or are lacking as to moral sense, may come here if they have the money to pay the launch hire and do a deadly slaughter. Nothing short of a law restricting the number of fish taken per day and each season will ever put a stop to the senseless practice.

When this is done and some of the objectionable features are removed from Avalon, it will be the nearest an ideal sea resort of any place I know. The marvelously clear waters, the wonderful submarine gardens, the matchless climate, and all that goes to make up the mystic Catalina are known to the world, and so surely as Southern California is destined to become the most thickly populated portion of the world, so is Catalina Island to be some day the most sought for refuge for those who love the sea and the mountains. But that will be when all the mountains are covered with green forests and every bay has its Avalon and every Avalon its city of canvas.

FRANK E. WOLFE.

Some Landsmen Afloat.

Editor Forest and Stream:

There were two of us who had suddenly become intensely interested in matters nautical, my partner and I. Our interest had its source in the then forthcoming international yacht races for the America's Cup, so-called, roundly and sonorously, though without warrant; for, while they are international, as a matter of fact, they are not so as a matter of law or dependency. Nevertheless, no parliamentary or congressional recognition could have added one iota to their importance and popularity from the viewpoint of the world's people.

The yacht races of this year promised to be a struggle far surpassing all others, consequently the preliminary doings of the colossal yachts, Reliance and Shamrock III., butterfly water sprites of the territorial ocean, excited our interest and enthusiasm both in our capacity as American citizens and as private individuals. In our private capacity we could hardly afford the expense incident to an actual view of the races; as patriots, all sordid considerations were cast adrift, and as patriots we decided to go. As private individuals we might derive some satisfaction from our doings as patriots, and, indeed, we did.

There was much to invest the yacht races of 1903 with superlative interest; Reliance had beaten, directly or constructively, all the American trial boats which had previously beaten the Shamrocks I. and II.; on the other hand, Shamrock III. had beaten all the other boats which had been beaten by the prior American defenders. Therefore Reliance would beat Shamrock III.; therefore Shamrock III. would beat Reliance. The American boat, furthermore, had a greater sail area, and would perforce have to give the challenger an allowance; the defender had bullhead bows while the bows of the challenger were sharp and beautiful; Capt. Barr would sail the defender, while Capt. Wringe would sail the challenger; therefore again Reliance would beat Shamrock III.; therefore Shamrock III. would beat Reliance, and therefore the civilized world was either to be present to behold the wonderful deed in its doing, or to have its ears aprick to catch the first news of the doings.

Nor was there any dearth of collateral incident. It was Sir Thomas Lipton's third magnificent attempt to "lift the Cup," and if he succeeded it would fill his heart and that of his good friend, King Ned VII., with sparkling delight, besides affording cause for national rejoicing in Great Britain, followed in a lesser degree by rejoicings in America; for if America could not hold the Cup, Americans would need a reasonable interval of time in which to organize and to launch their rejoicement. If Sir Thomas could lift the Cup he would perform a deed the counterpart of which does not exist in the world's history. Each side, too, had its strong features. For a captain, Reliance had that wizard of the wheel, Barr, who can sail his yacht in any direction even in a vacuum; and Shamrock III. had the equally great wizard, Capt. Wringe, who could be counted on at all times to point skillfully two or three points closer to leeward than could Capt. Barr.

Everybody was interested in the yacht races. Everybody was going to see them; that is, everybody who was anybody in the yachting world or who wished to appear as an integral part of it, barring the quite important class who have always some of that very uncommon mental equipment, common sense.

Nevertheless, there was general and profound enthusiasm exhibited by the public; yet of all the enthusiasts, the owners of craft for hire—steamboats, ocean and inland, of every size, kind, model, age, color, and condition of servitude—were in the first place in their devotion to the public service.

But all the public was not dependent on public boats. There were many people who owned private yachts, beautiful marine visions of comfort and luxury, whose owners discovered that they, at that particular juncture, possessed concentric circles of friends spreading far away in the area of the social perspective; who, as friends aboard, were expectantly desirous of seeing the yacht race, free of cost and full of comforts, which, all else failing, was quite sufficient warrant betimes to present themselves aboard uninvited, oblivious to all snubs and checks. To this vivacious and loyal class belong, presumably, the people who, actuated by a feeling of profound personal esteem, crave mementoes or souvenirs, such as the host's silver plate, cut-glass ware, wardrobe, bric-a-brac, the yacht engines, the masts, the anchor, or, in short, anything fit as a token of appreciation, or in keeping with the opportunity when the eye of the host is not upon them.

Having resolved to see all the races, the next step was to determine upon the manner of seeing. The big, fast boats of approved speed, comfort and equipment, were rejected because of the high fares demanded, that is, \$5 and upward. The low fares of \$1 to \$1.50 denoted journeying by the tug boats which, while speedy, were uncomfortable; or by little dinky steamboats, overcrowded and still more uncomfortable; and furthermore these were rejected because of their inferiority as points from which to view the races, and of their plebeian patronage. At least that was the way in which we figured it in our minds. We settled at last on a boat of medium fare, the Shinnecock, advertised as a new, magnificent, ocean-going steamer; licensed to carry 1,800 passengers, but limited on this occasion to 900; speed, 18½ knots; meals, table d'hôte and à la carte; military band; tickets, \$3; state-rooms, \$2 up.

The transformation of a landsman into a yachtsman is the simplest and the soonest thing in the world. He simply changes his clothes, and uses at haphazard a few nautical phrases which he does not clearly understand. When afloat and he observes that a racer has tacked, he loudly and learnedly exclaims, "She has come about," whereupon everyone else newly bedecked in yacht costumes, in unison exclaim: "Ah!"

Still, in a measure, at least, it is proper to conform to custom. All the yachting portrayals in the illustrated papers show the yachtsman in natty costume standing majestically erect on the quarter deck, in propinquity to a pretty girl gowned becomingly in yachting costume appropriate to her sex, and a marine glass airily suspended from her shoulders, all of which may properly be accepted as the true yachting mode. As a compromise, I donned a bicycle cap, an old office suit, and a pair of field glasses, thereby acquiring quite an amphibious appearance; and I pondered deeply how it was possible for a yacht to sail against the wind.

We bought our tickets many days before the races began, for the boat with a capacity of 1,800 was limited to 900, you know; still, that was a reasonable limitation when one considers the fact that it denoted a revenue of \$2,700, which, with moneys for berths, café, etc., made the aggregate receipts for one day about \$5,000.

On the morning of the first race I was ready to start in good time; so, after weighing anchor, I boarded a street car loaded with a cargo of working people whose port was in the top of some skyscraper where they were belayed all day long. On the car were a few other people with field glasses hung on their persons whom I identified thereby as yachtsmen. I was further confirmed in the identification by observing that their hands had a firm timber hitch around lunch baskets the size of ditty bags. At the ferry I met my side partner, who was becomingly attired in the every day clothing which he had been wearing for a certain length of time during past years. We immediately began a discussion as to whether there was or would be any wind. In our discussions with landsmen we had gotten into the habit of using the term miles instead of knots, and we found that it was a habit most difficult to break, so we let knots and miles go as meaning about the same quantity anyway; and, to the true yachtsmen aboard that day, we noted that a knot more or less had no great significance one way or the other.

We mounted the steamboat on the port side. There was quite a crowd at the gang plank, although it was more than half an hour before sailing time. We arrived thus early for we had cunningly planned that we would select some nice, easy, comfortable chairs which we would place in a sequestered, cosy and advantageous nook, in which we would seat ourselves, and then view in comfort and calmness the flitting single-stickers as they galloped nautically on to victory or defeat.

The idea was lovely. There were, however, more powerful ideas at work which completely avasted our ideas. There were a number of menial Ashantee and Senegambian Americans on board as servants who had cornered all the camp stools on the Shinnecock. With true race instinct in matters concerning the unearned increment, they were dealing out the camp stools impartially yet ostentatiously to the white man who held forth expeditiously a silver honorarium. No tip, no stool. To us it seemed an intolerable imposition that we should pay a good price for passage, which included a seat, and then be so held up by a lot of unscrupulous menials whose methods were not quite piratical.

We hastily decided to go fore and aft and amidships, upstairs and downstairs, in search of chairs and in defiance of the Ashantee trust. We noted, however, with some consternation, that the places of vantage were already taken, that the second best places were full to their limit, that all places were rapidly filling, and that the people were swarming in from every ingress, much after the manner observable on a bridge car during the rush hours when Brooklynites are homeward bound. We plied our search more expeditiously, but, thus seeking a chair, we found no chair, for the chairs were not—without a tip.

Every deck was crowded. At length we reached the hurricane deck, and even that was well occupied. A life raft offered the only accommodation in the way of a seat, so we quickly took possession, for to hesitate was to lose.

The raft was belayed to the deck, about two feet from its edge, and not far from the giant smokestack or stovepipe of the boat. Each cylinder of the raft had about two inches of lengthwise plank which served for a keel,

and on the edge of this plank we sat. Men soon took possession of the seats on our port and starboard sides, other men stood up behind us on the raft, while still other men stood on the space in front of us, and all this before the boat had cast off the ropes with which she was tied to the posts ashore.

Surrounded thus we could not see at all. The sun was shining with fervid warmth. The big stovepipe of the boat was making the air still hotter. The flags hung limp and still, denoting that there was no breeze. Everyone began to perspire violently, and it was a pleasure to note that the discomfort was shared equitably in common. And still the passengers swarmed in. Every deck had its crowd. We congratulated ourselves on the fact that the number of passengers had been limited to 900, though the boat was licensed to carry twice as many, for had it carried its full allowance of twice as many, several hundred necessarily would have hung off the rail over the side. And still the people swarmed aboard. A photographer stationed himself in front of me, and by gradual expansion of his territory inch by inch, he spread his tripod. I now was tucked up into the smallest possible compass. The boat started at last. I, by a simple process of calculation, had decided that the edge of a plank was uncomfortable, and that I preferred to stand. A camp stool also had been gouged into my back, my elbows were pinioned on each side from the pressure of those seated to the right and left; and in front was a wall of backs. I stood up, and therewith faded away all the pre-sailing anticipations of a comfortable seat during the race.

One could see but little better standing, for the crowd of 900 was so dense, and so many had taken every higher point of vantage, that vision in many directions was cut entirely off. But we were "seeing the races!" Besides, we had paid for a day of discomfort; that is to say, discomfort if one is not a seasoned yachtsman as we were.

We gained more comfort as the Shinnecock (limited) steamed slowly toward the racing course. The passengers had settled into such places as they could best possess. There was less elbowing and less scouting for good places which no longer were to be had. It was noticeable, however, that the yachtsmen in the beautiful navy blue suits and deep blue caps of navy shape and heavy gold braid on the bows thereof, were loath to be seated. They stalked about portentously, clapped their field glasses to their eyes as they paused for a moment to gaze earnestly into vacancy; or they strutted hurriedly and ostentatiously a fathom or two to shake the hand of some friend or acquaintance; or they stood with feet well braced apart, chest nobly expanded and head erect at magnificent heights, conscious of the admiration won from all beholders.

It was an incomparable opportunity to study human nature off its guard. No peacock or turkey cock, in the full flush of health and the full panoply of beautiful feathers, was ever so conscious of meriting the deserved admiration of his fellows. No tinsel king of the mimic stage ever felt more realistically the pride of real kingliness. Each landsman in navy costume believed that his externals were accepted at their face value; and they lived the part. They were pretty creatures.

We at length reached the starting point, just as the racers were jockeying for position. Soon the race began. There was a rush to the port side, and the boat listed so far over that some of the natty yachtsmen thought she would turn turtle, so they modestly stood nearer to the center of gravity. Soon a black cloud spread more and more skyward.

Shamrock seemed to outfoot Reliance in the work to windward, the race being fifteen miles out and back. A number of the yachtsmen in dustless costume agreed that Shamrock was gaining. Some quiet, unassuming gentlemen in citizens clothes observed that Reliance was pointing closer into the wind, and that Shamrock therefore was abating. I give only the substance of their remarks.

Forward on the hurricane deck sat a yachting avatar, a male being of surpassing loveliness. He was dressed in a yachting jacket of resplendent newness, on the lapel of which was embroidered a lovely yacht flag, and on his head sat jauntily a cap, heavily laden on the weather leech with gold braid, and it was faultless in shape. His legs were encased in duck of snowy whiteness, close hauled, and creased with skillful accuracy, while his feet reposed in canvas shoes whose whiteness was in keeping with his trousers. He sat on a camp stool with knees wide apart, arms akimbo, one hand grasping a field glass which he slowly and gravely placed to his eyes betimes. A big moustache, titian red in color, gave added beauty to his mature face. All made a figure of faultless symmetry. So white, so blue, so neat, so correct, he looked almost pure. He had seen perhaps about fifty springtimes.

Soon it began to rain heavily, and there was a general scramble for cover. In the disintegrating upheaval, I captured a camp stool. My side partner captured another. Anything nailed securely was safe from appropriation. A lot of us got to leeward of the big stovepipe, and thus were well protected from the rain. We could hear a faint, metallic sound of beer band music from below—that was the military band at work.

After a time the boat changed her course, leaving a lot of us exposed to the rain. A lot of other people gained protection from the rain by the change, so the ones left in the rain scampered for downstairs, or rather down a rickety ladder. We found the decks crowded to their full capacity. Also the table d'hôte and a la carte were overrun with patrons. I went below to the first deck carrying my treasure, the camp stool, with me. I attempted to buy a sandwich on the first floor at an improvised lunch counter behind which were several black waiters crowded together and constantly in each other's way. Yachtsmen were, in numbers of two to six, all calling for something of each waiter at the same time. After waiting about twenty minutes, the candidate for sandwiches would learn that he must first purchase checks. The cashier was seated at a cheap table, on which was a small satchel containing all his checks. He kept the satchel partially open, never left any checks loose on the table, and at every purchase made change from his pocket. He seemed to have a profound suspicion that yachtsmen were dangerous characters. About half a dozen people, as many as could surround him, were asking for six different things all at once, but he was calm and slow and methodical, and furtive and unper-

Camping in Ontario.

II.—A Still Day.

THAT morning, although we arose early, as usual, the sun seemed to be higher in the heavens than upon other mornings. Scarcely enough air was astir to disturb the perpendicular spiral of our camp-fire smoke. The expanse of water about the island seemed a vast mirror; and the only living things which the eye could readily detect were three loons that swam at no great distance from our camp. Occasionally, it is true, chancing to drop the eye to the dead branches of a fallen pine at the water's edge, one saw tiny flutterings of wings denoting the presence of small marsh birds; but casual observation failed to reveal further signs of life, unless one except the frequent buzzing of strange insects.

The shade of our tall spruce pines was a grateful contrast to the glaring, sun-heated areas in other portions of the island. A re-christening of "Burnt Island"—across the channel—would have seemed, that day, an especial sacrilege. Its broken, rocky surface; its studding of dead, bare, bleached pine trunks; its tangle of recent growth underbrush and small poplars; and its other inevitable signs of the forest fire that had at one time swept over it, gave the island a character that no other name would have fitted so appropriately.

A few cumulus clouds, of curious fantastic shapes, were the only companions of the sun in a sky of deep blue. When the bosom of the lake was ruffled by the movements of the loons below, sharp glints of reflected sunlight reached the eye, these occasional sparkles seeming only to emphasize the spell of endless quiet.

After a light breakfast we sat down to prepare our fishing tackle, but with none of that feverish haste that often characterized our movements. Indeed, the most delightful moments of the morning were those spent with the soap and towel at the water's edge on the shady side of the island. When the canoes were in readiness we did not start at once upon the day's trip; but we lounged about under the trees, watching the playful and graceful movements of the loons—for the birds seemed not to take the smallest notice of us; but sported themselves in the limpid water as if they had discovered the very heart of a wilderness never visited by man. Only when our morning caller, the game warden, brought out his rifle and disturbed the stillness with a trial shot, did the loons take alarm. He who watched closely saw dashes of spray as the bullet skipped along the surface of the water near the birds; and when he had blinked and looked again, the loons had disappeared, and only the ripples told where they had dived at the flash. In vain we watched the surface of the lake for many seconds for the reappearing heads until, at last, weird, high, tremulous calls told us where to look for a last glimpse ere they dived again. Soon they were gone, leaving us to comment upon the peculiarities of these strangest of birds, which laugh so fiendishly in lonely places.

So intense was the morning sun that the water in the Indian canoe at our wharf was already too hot for the perch which had been placed there the evening previous for bait, and which were now lying upon their sides gasping. A tender-hearted companion held one of these perch for a moment in the cooler waters of the lake, and then, opening his hand, permitted the revived fish to dart away with what seemed a joyous flop of the tail.

We paddled our canoes that morning with quiet deliberation, seeking the shady side of the lake before beginning the six-mile journey to the first portage. How dark were the shadows there, and comforting! How cool the water felt to one's trailing fingers! And how deep and dense were the pine woods! We kept our canoes ever within the shelter of the shore—now pausing to comment upon the strange appearance of some moss-grown granite rock that rose perpendicularly at the water's edge, or to listen to some crackling of brush back in the woods, and half expecting to see a deer emerge where yonder runway crept down to the water's brink. Compelled, however, to leave the grateful shade of that shore, we became subjects for the sun's displeasure as we wound a tortuous course up a marshy inlet toward the portage. At the portage we toiled painfully up the steep activity by a narrow, rocky pathway that now wound among stubborn underbrush and now emerged and ran along the very edge of some huge boulder, where a slip meant an ugly fall into the log race below. At the top we rested long under the pretense of examining into the nature of the surrounding region from the little summit, and then, lurching and stumbling with our load, we descended to the water's edge beyond. And now the mosquitoes from the stagnant marsh ahead discovered us. Not a breath of air stirred to drive them away; and our canoes wound very slowly along the sinuous channel among the lily pads, so ineffective were the strokes of our paddles. In this breeding ground of pestilent insects the water was silent, stagnant, and filled with decayed matter; while, on either side of the long, narrow slough were the white and silent trunks of sunken pine trees, whose roots had long since been killed by the water, and whose bare, straight, upright bodies standing close together presented the appearance of such a forest as one might expect to find along the river Styx. A solitary heron rose out of the marsh ahead of us and flew awkwardly to a perch upon a distant limb, its long legs trailing rudder-like behind it in its flight. A brace of duck a little further on rose with sudden flurry out of the still water when our presence disturbed the quiet of their summer retreat. But above all and always the mosquitoes hummed and stung with clamorous persistence. Once far enough into the open water of the lake beyond, however, these enemies left us for their own dismal swamp, and we were able to paddle about with some degree of comfort, in search of grass beds, and of likely logs at the water's edge, where bass are most at home.

The surface of Kahpeekog Lake seemed but another sky, so plainly did the blue ether, the white clouds, and the glaring sun reflect themselves there. We cast our baited hooks in the usual manner; but no fish arose when to take the bait required the least exertion. After a few trials, therefore, those seconds of expectancy which usually followed a cast became periods of careless indifference. So clear was the water that, looking over the shady side of the canoe, one could see every inch of

the bottom and determine easily the boundaries of the grass beds—could even see the wary bass, large and small; moving slowly, torpidly near the bottom, their bodies often half hid by their shelter of green.

The day was not a sportsman's day. Fishermen and fish alike seemed listless. We held our lines in hand over the shady side of the canoe, peered down into the transparent depths, and guided the bait cautiously before the very noses of the largest bass, jerking it away when small fish approached. And if, in a moment of awakened energy, one of them took the bait, away he went with it with surprising life and vigor—and "whir-r-r-r" sounded the deceitful reel, as if the cast had been honestly made.

At noon we landed and crawled away to a woody nook to eat the luncheon which the guide had provided; and finding the shade most comfortable we lay long upon our backs beneath the spruce trees, stirring only to pluck peppermint leaves and berries, or to dig resinous gum; and once, when we heard a rustling of leaves near at hand, to investigate it and, finding it to be a porcupine, promptly to tree the creature and to spend a fruitless hour in trying to dislodge him, and coming away anyhow with some of his quills. But on the whole the weather was too warm for this sort of exertion, and we spent the remainder of the afternoon dozing in the shadow, and gazing upward through the tree tops into the always mysterious blue.

Nor did we quit the spot and start upon the campward journey until, near evening, a freshening breeze from the bay began to whisper among the bows overhead, telling us that our still day was ended.

Natural History.

Visits with Apes and Monkeys.

II.—Visits with Old World Monkeys.

THE monkeys of the Old World can be readily identified from those of this continent by the following characteristics:

The partition which divides the nostrils of the Old World monkeys is narrower than that of the American monkeys. Again, the monkeys under consideration possess naked posterial patches called "callosities," which are often large and brightly colored. While not universal, the majority of Old World monkeys possess cheek pouches. They are on the inside of the cheeks and are only visible when in use. A monkey's cheek pouches are his pantry and upon giving him an over supply of food, if his cheeks begin to swell, and the more you give him the larger they become, you may at once know that his home is in the Old World.

With the exception of the baboons and Macaque monkeys, the Old World monkeys are more graceful in shape and appearance and brighter looking than those of the New World. Comparatively few of the slick-coated, bright-eyed members of the Guenon and Langur groups reach this country, so the majority of people, judging from the ugly Macaques or some of the unattractive Capuchins, imagine that all monkeys are as repulsive. If these people could visit the New York Zoological Park and carefully study the Guenons, which are represented by the Diana, Campbells, Mustache, Green, Sykes, and above all a specimen of the rare and beautiful *Brasus* monkey, I am sure that they could not help admiring them.

The disposition of monkeys is as varied as that of human beings. Some refuse absolutely to fraternize with anyone, even with their keepers, and it sometimes takes an animal loving person several weeks to persuade others that he is their friend. Then there is the crafty little fellow who would like to be friendly, but he knows that it will not do to trust every one. He comes to meet you, and when you try to encourage him, he stands just beyond reach, wrinkles the skin of his forehead, chatters and watches you distrustfully as if saying, "I know you act friendly, but experience has taught me caution. So many coax me within reach, then catch my hands and squeeze my fingers or wrench my joints when I pull away." If you are not able to win his confidence then, treat him with fruits or nuts, and it will not be many days before he grows friendly. Other monkeys are friendly with everyone. Though often subjected to torture, they seem never to learn from experience. They come promptly to the front of the cage, thrust out their hands or rub their sides against the netting to invite attention, but are often roughly treated. When this is the case, the other monkeys in the cage cluster about their companion and scold. The keeper, who can read the actions of his animals as one does a book, hears their cries for help and shouts at the miscreant, who answers, "I haven't done nothing," yet the agitation of the monkeys proves that the man does not tell the truth. I have known a culprit of this kind to re-enter the building several hours after teasing the monkeys and they recognized him immediately. Is it any wonder, then, that they look upon all strangers with suspicion? Only after many visits, during which I was bitten and scratched repeatedly, was I able through kind treatment, and frequent gifts of nuts and fruits, to convince the little Simians of my friendship. They learned my call, and when I gave it, on entering the building, answers coming from various parts of the room showed plainly that my visits were appreciated.

In the London Zoological Gardens, the monkey cages were not protected by guard rails, the lack of which gave visitors an excellent chance to torment the little creatures, and this opportunity was often taken advantage of.

To the right, before entering the monkey house, were two Japanese monkeys confined in a small cage. On my first visit they walked restlessly about, and as I came to the guard rail and extended my hand, they uttered hoarse, guttural sounds and made fierce grimaces. Kind words could not pacify them, and they

turbed, keeping his lunch checks and money safe first, and filling orders with languid deliberation afterward.

After securing the checks, the procedure then was to return to the lunch counter. Everybody was filling but no one was backing. The orders were flying in the air in cross volleys. "Here you, Charlie, six ham sand—" "Cup of coffee, quick, and there's a dime in it for—" "Hurry up with that chicken—" "Spoons. No I won't steal—" "Will you ever have those?" "Yes, sir, soon as—" "I ordered twelve sandwiches a half hour—" "Yes, sir," "Yes, sir," "All right, sir," etc. The black men, untidily clad, were scrambling about, worn down to stolidity and unresponsiveness. Great crystal drops of perspiration rolled off them. The man who was slicing bread and ham and assembling the parts into sandwiches was nearly blinded by the copious rills from off his head. Yes, it was fortunate that the passengers numbered only 900, else there would have been difficulty in serving food to them. The elaborate preparations of table d'hôte and a la carte were very nice—reading.

I consumed about one half hour in obtaining a sandwich. Natty men, wolf glare of eye, sharp of elbows, and with a clamorous yelp, were supplied in a few minutes, as a rule, as was also a mild mannered man with a piece of silver extended on his finger tips toward the Senegambian princes.

In the meantime the yachts were lost to view. After a while the heavy downpour of rain partly ceased, and we returned to the hurricane deck. There was our immaculate yachting knight still seated in the same position and same place. He had remained throughout it all partially protected by an umbrella. But his splendor was tarnished. He resembled a crushed lily. His crest-white snowy, smooth trousers clung wet and limp around his legs, his shoes looked sour, and there was a general air of the visit of the vandals. Nevertheless he wore his ancient smirk and his mind was well taut. When Reliance and Shamrock dimly appeared far away in the distance, he made expert nautical comment on the situation. He explained how it all happened. He criticised every movement of the skippers, exposed their bad judgment, explained a multitude of their mistakes, and gave his growing circle of listeners the benefit of his expert volubility. Had Barr and Wringe known how inefficient they were in yacht sailing and racing, they would have abandoned the sea forever.

There was abundance of acute criticism on every hand. On the deck below was a male dream in blue who swaggered and chattered simultaneously. "The Reliance sails best going to port," he loudly exclaimed. "Isn't it too early to go to port?" questioned his lovely yachtslady companion. "I mean that she sails best on a port tack," said he, compassionately. "Is that a hard tack?" queried she, sweetly. He looked deep into her sea-blue eyes and was silent for a few moments.

The excursion boats belayed every once in a while. A landsman would have said that they stopped. The long swell of the sea caused them to rock heavily to and fro as they awaited permission from the customs yachts to move forward. Our boat would stagger sidewise till she hit the water a mighty slap with her side, then slowly recover and stagger again. It was as if one were sliding back and forth on the upper side of a semi-circle. There was a general diminishing of vivacity and babble. Many of the ladies took on pale hues delicately shading into blue and green around the chin, with a general air of helpless languor. Soon they would disappear into the depths of the cabins. Also strong men seemed to grow grave. Opposite us a black ocean steamer rolled far to and fro, and some of her passengers had their heads over the rail in deference to old ocean. They were seeing the races practically.

The race was a failure. It was not possible to finish it within the time limit. Soon after Reliance turned the mark, a Sabbath day's journey ahead of the Shamrock, the boats all started for home. Now, thought I, we will show these other cart horses what a race horse boat really is like; for our boat of 18½ knots will leave them as if they were lampposts.

The Monmouth and the Peck were about abreast with us. I felt a pity for them. They nevertheless began to draw away. They began to lead us far forward. They disappeared at a point directly over our bows. Still other boats passed us. The Shamrock, with her tug towing her, was holding us even. A tug came along with a mighty wave on each side of its bows, a cavern on each side nearly down to her keel. She belched volumes of heavy, black smoke. We abated. She drew ahead. She crossed our bows. She, a traction boat, disappeared in the distance ahead. Other boats followed her and passed us. The tugboats of the ruck were gaining on us. We were doing a lot of first-class abating, our magnificent sea-going steamer of large fractional knots. Few men have been privileged to secure so many nots for \$3.

But we arrived in port at last, in a clear harbor, all the other boats having tied up long before, and all their passengers having disappeared in the spar decks of the trolley cars, arrived home, eaten supper and retired to rest.

My partner and I sought a good restaurant, ordered the biggest dish on the menu, ate till we were exhausted, dragged our weary selves to our dreary homes, slept the sleep of the exhausted, and started life the next day, and little we recked whether Sir Lipton lifted the Cup or upset it.

The first day demonstrated that Sir Thomas and the Cup would not affiliate, and that Shamrock III. was really Dennis de Grosse. But to see the races and to read of them are quite different matters. To read of them is easy and pleasant. To see them from the deck of a magnificent sea-going steamer, overcrowded, elbowed, trod upon, with accommodations wholly inadequate to the situation, is to gratuitously face innumerable petty troubles. Hereafter I am quite satisfied to read of the races in the columns of FOREST AND STREAM.

CHARLES DAY.

The Game Laws in Brief

Gives all the laws as now in force for fish and game throughout the United States and Canada. The provisions respecting non-resident and resident shooting licenses, limitation of amount of game and fish lawfully taken, export of game and fish, modes of hunting, and implements allowed, and all restrictions are here set forth for the guidance of the shooter and angler. The Brief is for sale generally by dealers in sporting goods throughout the country. See partial list in the advertising columns.

worked themselves into such a frenzy, that they seized pieces of vegetables and handfuls of sawdust and flung them at me. They did not throw as a person would, but struck out more as a pugilist does. In this way they feebly throw such solid articles as vegetables from five to eight feet with considerable accuracy.

These monkeys regarded everyone as an enemy and never became reconciled to anyone, not even their keeper, who was compelled to shut them in their sleeping dens whenever he entered their cage. For the head gardener they had a particularly strong dislike, and whenever they saw him, though he might be at a distance, their excitement rose and became more violent as he drew near.

Another large monkey, a Magot, occupied a similar position at the opposite end of the building. For several weeks he refused to accept attention from me, behaving much like the animals which I have just mentioned. When we first met he made faces so comical that I could not help laughing. This so infuriated him that he jumped against the bars, shook the cage and tried hard to reach me, and his fits of anger did not abate until I left. At each meeting his anger grew less, until one morning, during one of these outbreaks, he suddenly ceased his demonstrations and became quiet. Turning his head slightly upward, he looked away with a dreamy expression, not paying the slightest attention to me. His arms extended through the bars, and he allowed them to remain within my reach. I took his hand, stroked it, examined his fingers and spoke kindly to him. He seemed to be thinking, "This man has never teased me as many have done, perhaps he means no harm, I will appear to be off my guard and watch the result." I did not attempt to prevent him from withdrawing his arm, and this action, together with fruit which was offered him, touched the soft spot in his heart, and he "buried the hatchet" then and there.

After that meeting Freddy expressed his pleasure on seeing me, by smacking his lips, chattering his teeth and violently scratching his side. Should a visitor approach when I was near, or if I pointed at a stranger and said, "Catch him, Freddy," he became as infuriated as when first we met, though now his anger was concentrated on the stranger, but he allowed me to fondle him with impunity.

Freddy had his friend, better friend, and best friend. The first was the writer, the second, Mr. Clarence W. Bartlet, the superintendent of the gardens, and the third, his keeper. When the keeper appeared with the superintendent, his love for the latter turned to wrath, and should I accompany either, he immediately forgot my kindness. This jealousy I noticed was true with nearly all the Old World monkeys.

I left London and was absent three months. Upon my return I found Freddy in the "Monkey Hospital" suffering from a severe skin disease. He had not forgotten me, and his delight at seeing me did not subside for several minutes.

Every zoological garden has its complement of Pig-tail, Rhesus, Bonnet and Macaque monkeys. They all belong to the genus *Macacus*, which have rightfully been named the "grimace monkeys." To understand this term a person has only to point his finger at a member of the genus and laugh, and he will usually be treated to a series of facial expressions equalled only by a contortionist.

The aggregation of Macaque monkeys numbered about 175 specimens. They were confined in several large cages, occupying the center of the room, and they kept the building in an uproar.

They were nervous, extremely irritable and treacherous, and spent much time quarreling among themselves, or with monkeys in the adjoining cage; those in one compartment being pitted against those in the other. Wildly they would rush about the dividing screen like so many huge spiders, and amid defiant monkey chatter and encouragement from members in other cages the fight would open. Each would try to bite his opponent's fingers or toes, and at the same time protect his own. Of course, in grasping the netting their digits were laid liable to laceration, to avoid which they kept lifting one hand or foot, then the other, as though the wires were uncomfortably hot. A few gruff words from the keeper were sufficient to hush the uproar and send the combatants scrambling to the top of the cage. Quarrelsome though they were among themselves, they never failed to assist a companion when in trouble.

A boy once offered a Macaque monkey a nut, and as he reached for it, caught the monkey's hand and pulled him against the netting until the animal cried out. The keeper saw the act, and shouted to the boy in a loud, angry voice. The same tone and words which had many times been used to rebuke the monkeys, they now recognized as being addressed to someone else. Instantly every monkey in the inclosure was at his comrade's side and a dozen tiny arms were thrust out at the youngster, who escaped through the open door, frightened more at the monkeys than at the keeper.

They never missed an opportunity to snatch a hat, cap, bit of ribbon or bunch of flowers, and many complaints against them were made to the keepers.

I remember watching an elderly gentleman, who wore glasses, standing by a cage. A monkey came over to him and began to scold. The man became deeply interested and tantalized the little fellow with his cane. A second monkey, unobserved by the visitor, sneaked down from the top of the cage, and snatching the man's glasses, scampered back. It was the quickest piece of Primate devilry I ever saw. The man blinked a few times to convince himself that the glasses were not there, then looked at the monkey he had been teasing, and finally on the floor. Even when I showed him where the glasses were, he insisted that they were not his, and it took the keeper several minutes to convince him of the fact.

By far the handsomest creature in the building was a Brusus monkey. One could not look at his long white beard, heavy eyebrows, slick coat and beautiful form without expressing admiration. He was sedate, quick and treacherous, and scarcely noticed people unless they passed with fruit. He then drew their attention by shaking the loose wire netting, and as they

turned gave several nods of his head as if to say, "Yes, I am the one who did it." On receiving more than he was able to eat, he held the surplus in his feet until they were full, then stored the rest in his cheek pouches. He was fond of destroying pencils, and when teased with one, would snatch it and break it into splinters. The temptation to pet him was great. Although I had been warned repeatedly that he could not be trusted, I frequently ventured to scratch his side, to which he would submit for a time, then suddenly grab at me, but I was always too quick for him.

Occupying the other half of the same cage was a playful pair, a Green and Talapoin monkey. The former was extremely timid and never became fully reconciled to me. As I approached he would scud to his box in the corner and from there peep out. But when I appeared unconcerned and leaned against the cage, he ventured forth and inspected the buttons of my coat or ran his fingers through my hair, but the minute I turned he was off like a shot. Occasionally the two engaged in a romp, although their cage was too small to allow much exercise.

They were not so much disposed to play as their neighbors, a Diana and Ludio monkey, who wrestled like little acrobats and were sometimes so occupied in fun that they failed at first to notice me. As soon as they did, however, play ceased. The Ludio monkey would take my finger in his mouth and gently bite it, but always took care not to pinch too hard. When I playfully attempted to catch him, he scampered about and kept up a succession of springs, all fours in the air at once, and every time he struck the floor he threw the straw between his legs with his hands, until it was banked against the back of his cage.

A half-grown Mona monkey stationed at the far end of the building, became one of my best friends. After a little practice I could imitate his call quite accurately, and when I gave it on entering the building, he always answered and was ready to greet me.

From the innocent look in his light brown eyes, one would never suspect him full of deviltry, unless having seen the cunningness with which he allowed ladies to approach within reach, then out would shoot his long, slender arm, and before they had time to step away, he had an ostrich plume, bit of ribbon or other hat decoration, and was back to his perch enthusiastically pulling it to pieces. One day I found him with face and hands stained with indelible ink, the result of his handiwork at pickpocketing.

He, too, like the Brusus monkey, was fond of pencils, and his first act was to push back the lapel of my coat and look into my vest pocket. Experience had taught me to hide all articles of this kind before entering the building, but one morning I overlooked a fountain pen. During the course of his inspection he found it, and before I was aware he snatched it from my pocket and rushed to the top of the cage, where he tried his teeth on the rubber. I called a keeper, who brought a stick, and by feigning to strike the monkey, forced him to drop the pen. After the cage door was closed my little pet came down and showed his anger by scowling and crouching on the bottom of his cage, then rising suddenly, which act he repeated many times. For the rest of the afternoon he was ill-tempered.

Several times I came into the building with my hat pulled down and coat collar turned up, and walking un-naturally took a seat near his cage. He climbed about nervously and finally uttered his usual note in doubtful recognition. I once entered without giving the usual call, and as I wore a different hat, he failed to recognize me. When I put my finger into the cage he grabbed it and bit until the blood flowed. I spoke to him, but he did not heed, I called again and took off my hat; he at once answered, released my finger and looked into my face inquiringly as if to say, "Oh, I didn't know it was you."

For a long time I was in doubt whether the lively actions and somewhat fierce looks of a very interesting Sykes' monkey were his way of expressing pleasure or dislike, I finally mustered courage to test him in the usual manner. He bit my hand gently, but soon became excited and shut down too hard, whereupon I said "Careful, careful." This seemed to please him, for he rushed about the cage like a squirrel in a wheel, rolled over and over and then returned to play.

To attract attention he shook the netting and was the recipient of many choice dainties he otherwise would have missed. Of all my monkey acquaintances he seemed to enjoy my visits most.

Among the "white eye-lid monkeys" were several white-collared and Sooty Mangabeys. They had a peculiar way of showing their affection, putting their arms through the netting, then around my neck and drawing me close to the cage, where they held me as long as I submitted; meantime showing hostile demonstrations toward passing strangers.

I must tell of a Chacma baboon that was chained in one corner of a cage containing a miscellaneous lot of monkeys. He bubbled over with mischief, and was continually fighting or getting others into trouble. As the mesh of the wire netting was too small to admit his whole hand, he would put through the first finger of each hand and awkwardly try to pinch or gouge my flesh with his nails, at the same time throwing back his head, opening his mouth and seeming to laugh as though it was a great joke.

The other monkeys avoided their large antagonist, but occasionally became so interested in playing or picking among the straw that they fell victim to his watchfulness. The baboon was chained by his neck, and when a monkey was not within easy reach, I have seen him run the length of his chain, whirl quickly and stretching himself to the fullest extent, grab the monkey with his foot and drag it to him. Seated on the floor, the Chacma held his prisoner in front of him and subjected it to a half hour's inspection. If it attempted to escape it was unceremoniously hauled back by the leg, arm or tail. When a few of the monkeys came to their companion's assistance, the Chacma held it with one foot and fought off the others, but when they were joined by the reserves, his baboonship was compelled to release his prisoner and had an uncomfortable time indeed. Clustered about him, they

charged from every quarter, and while defending himself on one side he was attacked from another, and finally retreated to his corner squalling for mercy.

After being fed, he often turned his large square feeding dish on edge and tried to balance himself on it. Though it was only three inches deep, he frequently succeeded in doing so, much to the amusement of the spectators.

An infant baboon was placed in a cage near him. Its disproportionately large head gave it an extremely idiotic appearance. Its older relative, however, seemed to recognize the baby as one of its own species, and I fully believe that had the keeper put them together the little one would have been killed by affection.

J. ALDEN LORING.

OWEGO, N. Y.

The Spring Migration of 1903.

NEW YORK, August 19.—*Editor Forest and Stream:* Like J. L. Davison, I noticed a remarkable falling off of birds stopping on their migrations last spring, which I believe was due to the late spring, followed by clear moonlit nights. The former delayed the travelers, therefore they took advantage of the latter to make up for lost time. Naturally, as each flock stopped at fewer resting places than usual, each place had fewer visitors. Those which I did see were later than schedule, which helps to support this theory. I noted one marked exception to this rule in the black poll, which I saw on May 10. My observations are made in Central Park. Has anyone any other idea? If so, why not present it?

Sportsmen and Others.

(FROM FOREST AND STREAM Editorial of Aug. 8.)

"It is now coming to be generally believed that the less nature is interfered with the better, for it is nature that makes the world beautiful. There is beauty in art, but art can never equal nature. On the other hand, civilization is directly opposed to nature, and in the highest development of civilization nature scarcely exists."

(From Mr. Abbott H. Thayer's article in FOREST AND STREAM of Aug. 8.)

"Look at these two forces, side by side, in the effort to preserve game. The naturalist striving to save it to study and admire, and so that they may know that each wild region still has its wonderful typical inhabitants; the sportsmen, on the other hand, that they may kill it! Would any disinterested judge hesitate as to which of these attitudes is most representative of humanity's hope to-day?"

Now, Mr. Editor, much has been written in your columns of late on the above large and interesting subject, and much more can be written upon it. As this seems to be a "free-for-all" discussion, I propose to have my say also, taking for my text the above two quotations, in both of which apparent fallacies crop out, to the writer's apprehension of the subject.

In the several able and interesting articles that have appeared, each writer has expressed himself from his own viewpoint, with exclusion of other views; and, while there is more or less truth in all that has been said, there is a lack of co-ordination of the truths presented in different phases of the subject. It is now proposed to make an effort to round up the discussion from a more general point of observation.

Here is a significant matter for reflection, that in all the uncounted centuries of man's relations with nature in the past, his dealings with his fellow creatures of the lower orders have been of a haphazard and impulsive sort, merely to satisfy present needs or gratify existing whims, with little or no thought of the future—that is, leaving out domesticated creatures and confining the observation to the *fera natura*; and it appears that he is just now awakening to a realization of the fact that the supply of nature's children is not inexhaustible; that they have other important functions besides supplying meat or sport to mankind; that there is an ethical principle involved in the exercise by man of his dominion over his helpless fellow creatures, and that it has become necessary to study these relations with a view to their proper adjustment to suit all the requirements of the case for the present and future.

All of the discussions that have sprung up during the past few years, both upon the main issue and along collateral lines, involving the general subject of the ethics of sportsmanship, the conservation of the wild creatures, etc., attest the truth of the proposition that the present is the turning point in the history of man's relations to his fellow creatures who acknowledge only nature as their master, which has now become the subject of serious reflection by thoughtful people.

Reverting now to the "text" I have chosen for this homily, in the quotation from FOREST AND STREAM's editorial, there is matter for a more extended argument than is here designed, as being not strictly germane to the points at issue. But, taking the two propositions—"the less nature is interfered with the better," and "civilization is directly opposed to nature"—if both are accepted without qualification, it follows that man must either go back to a state of nature, or retire from the field altogether.

Man began to interfere with nature when he first set a snare for bird or beast, instead of picking up fruit for his subsistence. As he advanced to the art of cutting down trees, building habitations, and cultivating the soil, he interfered with nature still more, as also in the destruction of such creatures as were directly inimical to his interests, and the subjection of others that were useful.

It is evident that interference with nature is an

inevitable accompaniment of man's progress, and a prime necessity of his well being. The whole question must necessarily be viewed from the standpoint of man's own interest, and it becomes a question of degree merely—to what extent shall nature be interfered with, and in what manner, in order to accomplish the most good to man, or the greatest good to the greatest number of men, or to the men who most deserve the good, by earning it.

Let us stand afar off, as it were, and endeavor to take a comprehensive view of this whole question of man's treatment of the lower orders of nature from an outside and disinterested standpoint, dissociating our minds from the idea of being ourselves part of the *dramatis personæ*. What kind of a drama do we see being enacted on this globe of ours?

Well, we shall see that from a time in the dim and distant past this earth and its waters have been occupied by countless myriads of living creatures, composing innumerable multitudes of families, genera, species and varieties that are visible to man's eyes and obvious to his senses, without stopping to consider the more numerous inhabitants of the invisible "microbe world" of existence; that these multitudinous inhabitants are and have always been in continual toil and struggle, each endeavoring to climb upward in the scale of existence at the expense of his neighbors, regardless of any interests but his own, the two great dominating laws everywhere in control—"the struggle for existence," and the "survival of the fittest."

We then see man emerging from the struggling mass, and by rapid strides, relatively speaking, attaining a position far above the rest of the animated world, a towering height from which he looks down upon all other creatures and rightly assumes dominion over them, regarding them all as his servants, and demanding that all shall yield unquestioned allegiance to the "lord of creation," even to the sacrificing their lives for his needs or pleasures without murmuring.

But man's immensity of intellectual height above the rest of mundane creatures is associated with a still higher quality in his mental makeup; that is, the moral element. However the moral spirit became implanted in man's nature—and there are two opposing schools of opinion on this point, the natural and the supernatural—it is a potent factor in shaping his conduct, and is essential to a proper regulation of his relations to his fellow man.

But it has been a habit of mind to consider that all "soulless" creatures were without the domain of man's moral obligation, whose natural and proper destiny is simply to serve him in any way that he may choose to use them, with sole reference to his own needs or desires. And even where the moral sentiment of emotional persons has so expanded itself as to take in the welfare of the lower creatures, and feel a solicitude for them, this pseudo altruism has its real basis in self interest, as it is the pain that is suffered by these creatures reflecting a feeling of discomfort in our own minds, that is the real cause of our solicitude. Thus, a humane person may hire another to kill a superannuated pet, and think little more about the matter, whereas, doing the deed oneself would be shocking to our sensibilities.

Mr. Thayer's "humanity's hope," then, and all ethical considerations connected with the subject, must have sole reference to the further and higher development of man's moral faculties, and none to the good of the "soulless" creatures, except as so related.

Accepting this as the only rational basis of treatment of the subject of man's relations to the lower orders of mundane life, it follows that the only question involved is as to how these creatures can be so used in their totality as shall most conduce to the welfare of man in his totality.

There must necessarily be some conflicts of minor interests between men and men, in the application of the above principle, giving opportunity for the play of the true ethical spirit between them, or, on the other hand, for the display of intolerance or selfishness.

These conflicts of interests are determined by a difference in local conditions—as whether, for example, robins should be divided between Southern tables and Northern lawns, or wholly appropriated to the one or the other; or whether "game" should be used solely to satisfy the sportsman's appetite for sport, or the student's appetite for study and contemplation, or should be divided between them.

Here is a wide field, and a difficult one, for the exercise of a wise administration of man's common heritage in the children of the woods, fields and waters, so as to insure, as far as practicable, an equitable distribution of these bounties to all who are entitled to a share in them.

The problem is one of too great complexity for the application of categorical rules of treatment; but the general rule man be laid down that a just and wise consideration of the whole subject demands that we all recognize a diversity of interests to be served, and a difference of opinions existent, resulting from a difference of environment, all of which have equally valid claims to recognition, excluding only that class of claimants who are disposed to appropriate more than their proper share of the common store.

Returning briefly to Mr. Thayer's contribution to my "text." He contrasts the purpose of the sportsman in his efforts to preserve game with that of the naturalist, the latter's object being only to "study and admire," while that of the former is only to "kill it!"

The inference to be drawn is that in Mr. Thayer's opinion it is a very noble thing to study and admire game, and a very ignoble performance to kill it.

It is scarcely worth while to go into an ethical analysis of this proposition, but it may be pertinent to remark that while the cultivation of flowers, for example, with its implications, is highly commendable, that of edible vegetables need not be despised; and there is ground enough for both.

Furthermore, from even the naturalist's standpoint, it should be recognized that the purpose of the sportsman to preserve game to be killed, necessarily carries with it provision for a continuance of the supply; and the potential energy of the whole body of sportsmen in a combined and systematic effort to accomplish their

ends, should be the naturalist's surest recourse for realizing his cherished objects.

But there is another class of persons whose views are to be considered in a discussion of this subject, besides the naturalists and sportsmen, that is the economists. Students of this class have devoted much time and labor to the economic side of bird life and bird destruction. Much valuable and interesting information has resulted from their researches in the ascertainment of the character, and the proportions of different kinds of food devoured by various birds, and its relation to human interests.

The students have thrown a great deal of light upon the parts played by various birds in human affairs, and have dispelled many popular errors that were entertained on the subject.

But even this very intelligent class of workers, with their minds intent upon one line of thought, may be prone to carry a single idea to too great a length. For example, it may be stretching a theory too far to assume that because certain birds devour a great many insects or certain others a vast number of noxious seeds, that therefore there can be no higher nor more useful function for them, though they may furnish good sport for the gunner or highly prized delicacies for the table. In some "educational sheets" recently issued by the Audubon Society, it was shown that insects constitute a large proportion of the food consumed by certain birds that occasionally fall before the gun and do good service on the table. Also that in the stomachs of two mourning doves were found some 23,000 minute seeds of some weed. It was assumed that each one of these seeds would have produced a weed had it not been devoured by the birds, and that each weed would have required an additional stroke of the farmer's hoe to rid his field of it.

When Dr. Slop declared that he did not see how babies could be born without the use of his particular obstetrical instruments, Uncle Toby exclaimed: "Dr. Slop, you ought to have seen what prodigious armies we had in Flanders."

It may be assumed as a matter of common knowledge that in the economy of nature provision is made for enough seeds to feed all the seed-devouring birds in the world, with a large surplus left for propagating all the weeds that can find room to grow, and that a vast number must perish for lack of such room.

As regards the insect-eating birds, it may be said that among the numerous varieties of such birds only a very few of these varieties are habitually sacrificed to the gun, and that only a small percentage of the total number of individuals in each variety is so sacrificed; so that there is at least ground for argument as to whether there are not birds enough to serve both purposes, and whether a moderate tribute levied upon a limited number of the many varieties of insect-eating birds by the gunners, to serve a laudable purpose, shall materially curtail the cereal, vegetable and fruit crops of the country, by such appropriation of a small part of the insect destroyers.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The Adirondack Trout Season.

LAST Monday, Aug. 31, marked the close of the period fixed by law in which speckled trout can be legally taken in the waters of New York State. Various causes have conspired to make the fishing good this year, and the season as a whole has been the best that has been known in central and northern New York in a great while. Owing to the unusual amount of rain that fell in the summer of 1902, the larger streams were swollen beyond their normal volume nearly all of the time, and as a result the trout fishing in these waters was exceedingly poor. It is true that some fine catches were made last summer, but most of the trout taken were captured in the lakes or small brooks, and not in the big streams. As a matter of fact the fishing last year in the rivers and large creeks, in the Adirondack region especially, was the poorest on record, and in view of the small number of trout taken, anglers of experience predicted that if conditions were favorable there would be excellent sport on those waters this year. That their conclusions were correct has been clearly demonstrated by the splendid fishing which has been enjoyed this year ever since April 16, the date when the season began. It will be remembered that very little rain fell during the latter part of April, all of May and the first week of June this year, and owing to this fact the streams were much lower than they commonly are in the spring. For that reason, probably, the trout made their appearance on the rifts remarkably early and remained there much longer than they ordinarily do, thus affording the finest kind of sport for the angler. As a general thing trout fishermen expect to obtain the best rift fishing about the first week in June, but this year the speckled beauties were taking the fly in swift water fully a month earlier, something which has rarely if ever been known before in the Adirondack region. Last summer there was very little rift fishing, but this year the conditions have been exactly right for the prolongation of this ideal pastime. After the drouth had lasted a number of weeks, experienced anglers began to think that hot weather would speedily come on and that the water in the streams would then warm up so that the trout would forsake the rifts and take refuge on the cold-beds or spring-holes. Such was not the case, however, as the drouth was broken the fore part of June and the frequent but not excessive rains served to keep the water at a temperature congenial to the trout, while at the same time the streams were not swollen to such an extent as to scatter the fish, as they were last year. As a consequence rift fishing was enjoyed for a much longer period than usual, and when the trout finally sought the spring-holes they continued active, and are still biting, for that

matter. It is a noteworthy fact, too, that the fishing has been good this year in the lakes, ponds and small brooks of the wilderness region, as well as in the rivers and big creeks, and practically all of the trout waters have yielded an abundance of their carmine spotted denizens. From the standpoint of the fly-fisherman, as well as that of the angler who prefers bait, and the eclectic fisherman who uses both artificial flies and bait as conditions appear to warrant, there has been fine sport on the trout waters of northern New York throughout the season, and in central New York the fishing has been fully as good as could reasonably be expected. The assertion can also be safely made that a remarkably large number of big trout have been taken this year.

One of the largest speckled trout that has ever been captured in the waters of the southern Adirondack region, so far as records show, was taken in South Lake about May 20, by Jerry Shaw, of West Utica. It measured 28 inches in length and weighed 8 $\frac{1}{4}$ pounds after it was dressed. Mr. Shaw caught it while fishing for salmon trout at a buoy, which was located off the point below the cottage owned by George W. Williams, of Remsen. The trout had been feeding on the bait which had been scattered around the buoy to attract the lakers, and had gorged himself with it. R. L. Guiteau, proprietor of Hotel Brunswick, Port Leyden, who chanced to be at South Lake at the time, in company with G. W. Williams, is an enthusiastic angler, and he secured the head of the big trout to take home. The lower jaw of the fish measured 5 inches from the point to the back end.

Another record breaking brook trout was captured last spring in the Unadilla River at New Berlin, its weight being 6 $\frac{3}{4}$ pounds. These are remarkably large speckled beauties, and it is very rare indeed that such specimens are taken in New York State waters. It is on record, however, that an Adirondack guide, while trapping on Loon Lake, in the fall of 1896, found a speckled trout which had died and drifted ashore, that weighed 8 pounds. On July 10, 1888, A. Ames Howlett, of Syracuse, while fishing on the inlet of Cranberry Lake, in company with Chester S. Lord and J. Earl Knox, of New York City, caught the largest brook trout of which there was any record in that part of the wilderness. It was 21 $\frac{1}{2}$ inches long, 6 inches deep, 3 $\frac{1}{4}$ inches thick and weighed 5 pounds 14 ounces. On July 7, 1887, Mr. Mills, who was then keeper of the State dam at Cranberry Lake, captured a speckled trout in the Oswegatchie River which tipped the scales at 5 pounds 13 ounces. It is said that Walter Aiken, a resident of Franklin Falls, N. H., caught a speckled trout in Graves Pond in 1884 that weighed 6 pounds and 2 ounces. There is excellent authority also for the statement that in October, 1901, seven brook trout, weighing in the aggregate 42 pounds, were exhibited in the village of Morehouseville, Hamilton county. Reports have also been heard of a trout weighing over 11 pounds being taken from a small pond in Essex county, without regard to the ethics of fair angling, and of another weighing 13 pounds and 3 ounces that was taken from the inlet stream of the same pond during the spawning season some years ago. It is such an extremely rare occurrence for a speckled trout weighing over 5 pounds to be taken from the waters of New York State, that it would be interesting if all the readers of FOREST AND STREAM, who have any knowledge of such lucky captures, would write what they know about it for publication in these columns.

UTICA, N. Y., Aug. 24.

The Sleep of Fishes.

SANDY GRISWOLD, in the number for August 22, mentions a correspondent who has asked him if fish sleep, and he says in reply that they do; he has often seen them asleep. So have the rest of us who have had an opportunity to watch them and the curiosity to do it. All fish, birds and animals must sleep part of the time, of course. Among the birds and animals, except a few of the nocturnal ones, they select the night to do their sleeping in; but in case of the fish I do not suppose it makes any difference to them when they sleep; they can go to sleep whenever they feel like it, always, providing, that none of their enemies are in the neighborhood.

Some of us have seen the whale lying asleep on top of the water, and if we used care when we approached him he continued asleep until the harpoon was thrown into him.

Early this summer I was across in Misery Bay one afternoon; it is a small bay about one mile wide, that opens into the harbor here; a boat house stands in 6 or 7 feet of water on the far side of the bay, and landing here I made my boat fast to the platform, then went to take my oars off the pins, and when doing it happened to look down into the water, and saw that I had a good view of the bottom, the water being clear and the sky bright overhead. Several good-sized black bass lay on the bottom just below me. I had seen larger ones than these, but not in this bay. No fish in these waters except the carp and muscalunge get a chance to grow very large or die of old age before some man or boy pulls them out of it.

Without making any noise to waken the fish, I lay with my head over the side of the boat watching them as they lay on the gravelly bottom, not making the least movement except a slight one with their gills, while a number of small bass swam around and over them without seeming to disturb the sleeping fish at all.

After I had watched them a while I moved off quietly, not wanting to waken them, and met two boys in a boat, who wanted a good place to fish, they told me.

I might have sent them to a good place, the one I had just left, but did not want these fish caught just now, so I sent the boys across to the wreck of the Niagara, a few hundred yards away, and told them to fish there. The Niagara was Commodore Perry's flagship in the battle of Lake Erie in the War of 1812, and when wanted no longer was brought here and let sink in 10 feet of water where, what is left of it, still lies. A gentleman here in Erie has at his own expense

marked its site with a neatly painted spar buoy lettered on its sides, "Perry's flagship Niagara."

Just across the channel from this bay, on the south, is another small bay that goes under the name of the "Mud Flats." It is occupied by German carp and mud turtles, nothing else could live in this water at some seasons of the year, as the sewerage of half the city is emptied into it; this seems to suit the carp, though. I have seen them throw themselves clear out of the water here, and have been within a few feet of some of them when they did it. It reminded me of a whale sounding; why they do this I could not find out. There is nothing in there to chase them, unless it is the mud turtle, and a carp should be a match for him; he is a match for everything else. Some of these carp are all of 18 inches in length. They will not take any bait that I have ever seen offered them. If I wanted them (but I don't, and can't imagine why any one else should want them) I would use flour dough for bait; that, I think, would suit them.

It has occurred to me that the man who first brought these carp here must have been a near relative to the man who brought the first English sparrows here, and if both these men are still living they must recognize now that a hind sight at times is far better than a foresight.

I know a man who, when the carp were first brought here, spent several hundred dollars in making a fish pond to raise them in, and when he found how worthless they were it cost him as much more to get rid of them and restock his pond with fish that were worth raising.

I afterward tried to interest him in the raising of a goat that had been brought here to make the fortune of any farmer who took hold of him; but the carp had soured him on all foreign importations, he said, using some of his emphatic language to express himself, that sheep would do for him from this out. I dare not laugh at him. He had a large place of some 300 acres, and had about as many trespass signs painted all over it, but I could shoot on it where I pleased.

In fishing, I suppose you will have the most success if you use the kind of bait that the fish happen to want just then; almost any kind of bait will be a killing one at some time or other. There is one exception though; there is a kind of bait that is sold by barkeepers in pint flasks that, though it is often taken along, does not kill many fish. I have been told that it will kill the fisherman if enough of it is used, but have never tried enough of it at one time to find out.

I did some fishing at one time in the Red, Colorado, River, Texas, near where the town of Paint Rock now is. The first fish that I caught here, a yellow catfish, I had to shoot before I could land him. The men in my wagon train estimated his weight at 110 pounds, he weighed at least 90 pounds; I used fresh beef as a bait, and leaving two lines out all night, I had a smaller fish on each of them next morning.

I tried this river again some time after this, and below where I had fished before. I told the cook to keep me fresh beef for bait; he kept it, but kept it where my dogs could get at it, and they got the bait before I did, and I would have to look around for something else; I did not want to use the dog for bait, as the cook had suggested I might. These dogs would have been used as a target by that cook long before, only he did not want to be made a target out of himself, as he would likely have been if he had shot one of these dogs of mine. The only bait I could find was boiled bacon, and I concluded to try it. Baiting a 5-0 hook on a cotton line, about No. 10, I got out on a pile of drift in a bend in the river, and began fishing; in less than an hour I had three catfish, the largest one would weigh 20 pounds, the others were smaller.

CABIA BLANCO.

ERIE, Pa.

Fish and Fishing.

Fall Rush of American Anglers.

SENATOR PLATT, of Connecticut, his son, Judge Platt, and a party of friends from New Haven, are guests of the Metabetchouan Fish and Game Club at Kiskisink, on the line of the Quebec and Lake St. John Railway, and from all reports are having excellent sport with the now fairly well educated trout of this famous preserve. Twelve to fifteen years ago, when I first fished Briggs' Pool, the lily pads below the railway bridge, and the rapids a little higher up stream, with the late Mr. Chase, of Waterbury, Mr. John Wallace, of Ansonia, and others who have since dropped out of sight, it required no art to catch the 2-pound trout that abounded in all these localities, and the larger ones which frequently diversified the sport. There are probably just as many fish in the waters of the preserve now as ever there were, for the protection has been conscientious and constant, but better fishing is now required in order to make as good a basket, in an equal space of time, than was necessary a decade ago, and I know a good many anglers who prefer the fishing as it is to-day, both in the Kiskisink waters and in those of the Metabetchouan River, on the other side of the club's limits. For those who do not, and who find their chief delight in casting over waters where the uncultured fish lack the refined discretion which comes alone with experience of the angler's lure, there are virgin waters enough still, though it is necessary to travel much farther north now for them than it was a few years ago.

Senator Platt and party are likely to go to Lake St. John for ouananiche fishing before returning home, for just now this sport is at its best in some of the Lake St. John waters, especially in those of the Metabetchouan. In addition to the sport which has been afforded of late by the Grand Discharge, I understand that fishing for ouananiche has produced good results during the last few weeks, in both the Peribonca and Ashuapmouchouan rivers. I should strongly advise American anglers who intend to seek the ouananiche in September, to bring with them larger flies than those employed in the Grand Discharge in the summer months.

Large Salmon Flies.

Speaking of larger flies for ouananiche, especially in the heavy water of the Metabetchouan in the month of September, recalls some enormous salmon flies shown me on board the King Edward last month by Mr. Charles Stewart Davison, of New York, while on his way home from his salmon fishing on the Riviere a la Truite. Some of the flies which he had with him and which had proved so successful, were at least four times as large as the largest flies generally used on Canadian salmon rivers. Notwithstanding their successful use this season, Mr. Davison admits that they have always been regarded as abnormally large, at least on the Labrador coast. This makes their success all the more interesting. Of course the six weeks or more of almost constant easterly winds and the almost continual rains during the period covered by Mr. Davison's fishing, produced conditions of light and water which were a little out of the common, and he says that it is well also to note that the large flies appeared of most use over deep, smooth, swiftly flowing water, under overcast conditions of the sky and during showers. The notes on the subject, with which Mr. Davison has been good enough to furnish me, show, incidentally, that contrary to ordinary experience, on at least one occasion, the fish took these flies during a rain storm which was accompanied by occasional thunder. It should be explained that the locality was the pool below the first falls on the Riviere (also called the Riviere a la Truite), which is about eight miles east of the Moisie, and that Mr. Davison resorted to the abnormally large flies tentatively and only after exhausting effort with smaller ones.

The noted, so far as they refer to this matter, read as follows:

July 10.—Air, 8 A. M., 60 degrees; 3 P. M., 54; 8 P. M., 54. Water, 8 A. M., 58 degrees; 3 P. M., 58; 8 P. M., 58. Eight A. M. to 11:30 A. M., at the pool below the first falls, the wind was southeast to east to northeast, half a gale; early, showers; later, heavy rains with some thunder and a little lightning. Hooked and killed four fish: (1) 13 pounds on No. 6 double Durham-ranger. (2) 10 pounds on No. 6 double Durham-ranger. (3) 22 pounds on No. 2-0 sun-fly. (Note: This is an English fly, which fills the gap between the dusty-miller or silver-doctor and the Jock-Scott, so far as brilliancy is concerned. It is practically unknown on this side of the Atlantic.) (4) 11 pounds on No. 2-0 double sun-fly. N. B. Very black and very showery while fishing. Tried without result No. 4 and No. 6 double thunder-and-lightning, ditto dusty-miller, ditto Jock-Scott. P. M., same pool very dark, heavy rain. Hooked and lost one fish 16 pounds on No. 4-0 double silver-doctor. Very active fish, fresh run with the sea-louse still on him.

July 11.—Air, 8 A. M., 58 degrees; 3 P. M., 56; 8 P. M., 58. Water, 8 A. M., 59 degrees; 3 P. M., 58; 8 P. M., 58. River, which had fallen about 18 inches, now up 8 inches. A. M. In the pool below first falls, hooked and lost one fish (fly broke) on No. 8 double dusty-miller. P. M. Same pool, hooked and killed one fish 10 pounds, fresh run (very strong and active for his size), on No. 4-0 silver-doctor. River up from 14 to 18 inches more, since morning.

July 13.—Air, 8 A. M., 52 degrees; 3 P. M., 56; 8 P. M., 54. Water, 8 A. M., 58 degrees; 3 P. M., 58; 8 P. M., 58. A. M. Did not fish. 4 P. M. to 8 P. M. hooked and lost (cast line broke) heavy fish on No. 2-0 double Jock-Scott; hooked and lost very heavy fish (line broke); he took a No. 5-0 single Jock-Scott. Hooked and killed three fish: (1) 14 pounds on No. 3-0 double Jock-Scott. (2) 13 pounds on No. 4-0 double silver-doctor. (Later, weather much brighter.) (3) 12 pounds on No. 2 double Jock-Scott.

July 14.—River run down to about normal height; overcast, easterly wind, showers. Air, 8 A. M., 54 degrees; 3 P. M., 56; 8 P. M., 60. Water, 8 A. M., 61 degrees; 3 P. M., 61; 8 P. M., 60. In the morning, in the pool below upper falls, hooked and killed one fish 11½ pounds on No. 8 double thunder-and-lightning. In the P. M. hooked and killed three fish: (1) 11½ pounds on No. 1 double sun-fly. (2) 13½ pounds on No. 4-0 double Jock-Scott. (3) 21 pounds on No. 4-0 double Jock-Scott. (Last two were fresh run fish.)

Mr. Davison draws special attention to the sun-fly, which he thinks might be largely used to advantage in this country in sizes from No. 3 up. He believes it is hardly suitable for and not necessary in smaller sizes, as the dusty-miller or silver-doctor in the smaller sizes are not so obtrusive as to need toning down.

E. T. D. CHAMBERS.

Craved Salmon and Oregon Water.

MANY Oregonians were inclined to laugh at the Missouri woman mentioned a short time ago who insisted on going back to her native State because there were no catfish in Oregon. It appears, however, that Oregon women are as whimsical as Missouri women, as a citizen who has two sons practicing law in Brooklyn, N. Y., and doing very well, went on there with his wife to visit them a short time ago, and at her desire left her there. She thought she could look after the boys and enjoy life in the East, but she has quite unexpectedly returned home. When asked why she did not remain in Brooklyn, as arranged, she said such a craving came over her for a slice of Chinook salmon and a drink of Bull Run water that it seemed as if she could not live without them, and so she came back.—Portland Oregonian.

A Catch of Lake Trout.

TIM, Maine, August 27.—On August 17, at Spring Lake, Maine, Dr. Joseph Pettit, of Philadelphia, and the undersigned, of New York, hooked and landed twelve lake trout in three hours and fifteen minutes, the smallest 2 pounds, the largest 4¼ pounds. We used Archer spinners with smelt, and for line used copper wire, no sinkers. We trolled very slowly, and but about 100 feet run off our "quad" multipliers. The fish were weighed and counted in the presence of J. B. Carville, proprietor of the camps, and several witnesses.

ROBERT STODART.

The Known History of the Salmon.

RECENT researches of scientific experts and the lengthy inquiry held by the Royal Salmon Commissioners point unmistakably to the fact that our actual definite knowledge of the life history of the salmon is very limited; that many of the theories held by men who have been regarded as authorities are, in some cases, erroneous, and in others based upon insufficient evidence; and that the subject offers abundant opportunities for extremely useful and far-reaching research. We propose to set forth briefly what is known definitely concerning the life history of the salmon, and to indicate a few of the points on which further research is desirable.

In the first place, as every one knows, the eggs of the salmon can only be developed and hatched in fresh water, and, with few exceptions, they are deposited between October and January. Where unwise netting operations upset the balance of the sexes there are considerable losses on the breeding grounds, owing to the warfare between the males. The proportion of eggs fertilized is at present unknown, but they lie covered for a period varying with the temperature of the water. For example, if the water be at a temperature of 45 degrees, eggs will hatch in about ninety days. The spawners which enter the river late in the year, lay their eggs in the lower reaches, which in some rivers are seriously polluted, with the result that the eggs do not hatch. Many pollutions, which do little harm to mature fish, destroy, not only the eggs, but the young fry. The newly hatched alevins, as they are termed, are about 1 inch in length. At four months they are about 2½ inches, assuming that their growth is the same in the river as it is in the hatchery, which may be assuming too much. The year-old salmon is about 4½ inches to 5 inches, and two-year-olds about 7 inches. Most of the young salmon put off the appearance of trout and become silvery fish when they are from eighteen months to two years old, and then descend to the sea, the majority making the descent between April and July. This is a time of danger to the future 40-pounder. Pike, perch and possibly kelts, lay in wait for him in the lower reaches. There may be a seriously polluted estuary to pass through, and once in the sea there are shoals of coal fish, porpoises and other predatory fish all hungering for the little smolt, while gulls and other sea birds never lose an opportunity of destroying them. How many smolts reach the sea in safety as the result of the deposit of a hundred salmon eggs under the gravel we do not know, and it is of great importance that this should be known to enable a comparison to be drawn between the artificial culture of the salmon and the natural increase of the fish. Nor of the travels of the smolt in the sea have we any definite knowledge. Occasional fish are caught two miles or more from land. Norwegian experiments tend to show that smolts, after their descent, are absent from the estuaries or river, and there our knowledge ends. When do they return? To test this question the managers of the Stormontfield Hatchery on the Tay carried out experiments many years ago. They cut the adipose fin off a number of smolts, which they then released. It was said that a small proportion of these fish came back the same summer as good-sized grilse, while others, and these were the majority, returned the following year. This would seem to settle the question, but there are high authorities who decline to accept the evidence on the grounds that the experiment was not carried out with scientific precision.

Whatever their age, grilse usually enter fresh water in shoals, ascend the river again between May and September, and some of them, at any rate, develop ova and breed the same season. After they have spawned and entered the sea they lose their delicacy of scale, fineness of shape, and forked tail, and are known henceforward as salmon. The periods at which salmon run up rivers, the sizes of the fish of different runs, and their ages, are all points of practical importance. It is not wise to draw general conclusions from observations made on one river, but we may mention that it has been ascertained that on the Tweed the salmon of May and June average 73.8cm. in length, in July and August 82.9cm., and in October and November 87.76cm. Speaking generally, salmon which run earliest are those which ascend to the highest tributaries to spawn, while those that run in autumn breed in the lower reaches, which, as we have already pointed out, are often polluted to such an extent as to destroy every egg. In the spring run there are, in many cases, far more females than males, but later on in the year the two sexes become more even in numbers. It would appear from these facts that our scheme of salmon preservation is altogether wrong; for, by heavily netting the spring fish, and taking the nets off early in the autumn, a quantity of females are destroyed, and an insufficient number of early salmon are left in the river to populate the upper reaches at spawning time. The system leads to most of the spawning being done in the lower reaches, and to an undue proportion of males on the spawning beds. A wiser course would probably be to so arrange that a proportion of every run of fish was preserved for spawning purposes, but the wisest would unquestionably be to prohibit netting in rivers altogether.

Where the salmon goes when in the sea we do not know. That they travel up and down the coasts is evident from the fact that thousands are caught in fixed nets, but that they make many deviations also appears certain. It is quite evident from the marking experiments of late years that the majority of salmon which escape the sea nets return to their own river, a certain number, however, ascending other rivers. Some fish go down as kelts in the spring and return to breed in the autumn of the same year, but it seems probable that the majority breed in the following year; in other words, are biennial breeders.

With regard to the growth rate and food of the salmon while in the sea there seems no doubt from the examinations of fish which have been caught in salt water, that the chief food of salmon is the herring; but there is also no doubt he picks up any small fish

which comes in his way and is not active enough to escape. In the Baltic salmon are caught in the sea on lines, the hooks of which are baited with herring. Sand eels also seem to be a staple article of salmon diet, and the fish, without much doubt, lives largely on the shoals of herring, mackerel and sprats. Thanks to his liberal diet in the sea, consisting largely of oily food, the salmon puts on fat rapidly, and at the time he ascends the river he is so well stored with superfluous adipose tissue that he can stay in fresh water for several months without requiring food. That he does occasionally pick up inconsiderable trifles there seems no doubt, and were it otherwise salmon fishing would lose much of its interest. There is, of course, more known concerning salmon than we have stated in the foregoing remarks, but we have confined ourselves chiefly to those points which have to be considered and are of importance in connection with the preservation of the fish.—London Field.

The Old Colony Club.

BOSTON, August 29.—*Editor Forest and Stream:* Yesterday afternoon your correspondent had the pleasure of attending the annual meeting of the Old Colony Club. It has been customary for the club to hold a summer meeting and dine at some one of the hotels on the Buzzard's Bay shore, but this year the members were invited to a clam bake on Mashpee Island, situated a mile from Monument Beach Station on the Wood's Holl branch of the railroad. Steam launches were in readiness to convey the members and their guests from the beach to the island from 10:30 A. M. to 12:30 P. M., the hour set for the meeting, although very many came in their private yachts.

The tables were set up under a tent to provide for about 100 persons, but on account of the unexpected number in attendance several other tables were spread outside to accommodate the overflow.

The announcement in the daily papers that Mr. Jefferson would preside and that ex-President Cleveland would speak, served to bring together a much larger number than usual, and the day proved to be most auspicious for an outdoor meeting. President Cleveland brought Mr. Jefferson and Mayor Collins, of Boston, over from "Gray Gables" in his private launch, and on their arrival at the island they were greeted with hearty cheers from those who had gathered on shore.

At the business meeting Vice-President Gerard C. Tobey, of Wareham, presided, and the officers of last year were all re-elected. Mr. Jefferson has been president ever since the club was organized, about twelve years ago. On the list of vice-presidents and directors are representatives of the summer residents and prominent citizens of all the towns on the bay shore, among them being Commissioner Delano, Hon. Charles S. Hamlin, Henry R. Reed, Esq., and Dr. Maurice H. Richardson, Vice-President of the State Association.

After the clams, oysters, lobsters, green corn, sweet potatoes, etc., had been disposed of, the President, in his inimitable manner, and with happy allusions to the distinguished guest at his right, introduced Mr. Cleveland. It was evident that Mr. Cleveland felt very much at home as a fisherman among fishermen, and I venture to say he never received a warmer greeting. From the moment he rose to speak he must have felt the sympathetic heart beats of his auditors, who frequently interrupted him by their hearty applause. While his first words were exceedingly humorous and excited much merriment, there was an under tone of serious convictions regarding the importance of the work for which the club was organized.

He said:

"I am full of clams and enthusiasm for the welfare of the Old Colony Club and zeal for its interests."

"I fish because I like it. For those who jeer and deride me for it I have unqualified contempt, and the hardihood to keep right on, and I hope I shall continue to go a-fishing until as near the end of the chapter as possible."

"I wish to say right here, I am more interested in the protection of the fishing in Buzzard's Bay than the protection of our hoary-headed infant industries. I care more for these fishing interests than I do about the policy of the next federal administration. I hope the Old Colony Club will keep up the fight for the protection of the fisheries. Let there be no relaxation nor compromise. Keep up the fight without ceasing; for 'eternal vigilance is the price of protection.'"

In the course of the happy response to the call of the presiding officer, Mayor Collins referred to Mr. Cleveland as "the most illustrious citizen of the United States," and he might have added, equally conspicuous as a sportsman. As he stood before the audience, erect and stalwart, the proud father of a three-weeks-old boy, he was in his person, aside from what he said, an illustrious example of the benefits of outdoor life.

Referring to the work of the club in a former letter, I said it had the laboring oar in the stopping of seining in the Bay and abolishing the use of traps and pounds. Messrs. Cleveland and Jefferson were charter members and their influence has been of great advantage to the club from its inception. Great credit is due Mr. Charles H. Taylor, Jr., the Secretary and Treasurer, who had charge of the arrangements, for the success of the meeting and dinner.

The Old Colony Club was formed about a dozen years ago with a small membership, which has steadily grown until it comprises nearly all the summer residents along this bay shore and also many prominent citizens of Cape Cod. The objects of the club are these:

To secure and protect—by obtaining, maintaining, and enforcing proper laws—the salt water fishing of Buzzard's Bay from depletion and destruction by nets and pounds.

To create interest in and obtain public and private attention to the making and maintaining of convenient, comfortable, attractive and economical highways and roads within the limits of the Old Colony.

To induce and aid the preservation of all places of historical, peculiar or picturesque interest within the limits of the Old Colony.

To procure attention to, and the planting and preservation of, forest, shade and ornamental trees within the limits of the Old Colony.

Some Big Fish.

MR. CHARLES A. SHRINER records in the Paterson (N. J.) Chronicle of August 30: While the politicians have been busy during the past few weeks in endeavoring to fathom the new primary elections law and circumventing the will of the people, the disciples of Isaac Walton have been doing things never heard of before in this part of the country. Following hard upon the taking of a large muscullonge in Greenwood Lake came the taking of a 16½-pound channel catfish out of the same water, an incident rendered more remarkable still by the fact that the same boat took a 6 and a 7-pound wall-eyed pike the same afternoon. Mr. Joseph Rigby, of No. 141 Huron street, this city, surpassed the record for small-mouthed bass. In one afternoon last week he took four of these fish which weighed 6 pounds and 3 ounces, 5¾ pounds, 5½ pounds, and 4½ pounds, the scene of his exploits being Franklin Lake. About the same time Mr. John P. Cronin took a 3 pound white bass out of Greenwood Lake, the capture of this fish taking place within a few minutes of the taking of another of the same kind, but of less size.

None of these fish were of a kind indigenous to New Jersey. Although we have plenty of natural perch and pickerel ponds the black bass is an immigrant, but it is evident that he has done well here, and that he is about as well established as any of the fish indigenous to the State. The size of the fish taken is remarkable, for it is no onetime that black bass of the small-mouthed variety are taken exceeding five pounds in weight. It is doubtful whether another such catch as Mr. Rigby's has ever been made in this country.

The channel catfish, the wall-eyed pike and the white bass are comparatively recent additions to the fish life of the State, for the first of these fish in New Jersey did not arrive here until about six years ago. The taking of the large fish establishes the fact that these fish will live in New Jersey waters, but whether they will propagate there is an entirely different question. Although the wall-eyed pike may have propagated in Greenwood Lake there is still no evidence that the channel catfish or the white bass have done so, for those removed from the lake were evidently all stock fish. In fact, the experiment looks rather dubious, for if these fish had propagated smaller specimens should have been taken in considerable numbers long before this.

UNIONTOWN, Pa., August 17.—A mud cat weighing 55 pounds and measuring 48 inches in length was landed by John A. Faddis, proprietor of the Monongahela House at Rice's Landing, assisted by his son James and B. F. Wilson, of Dayton, Ohio.

AUBURN, August 17.—Sportsmen of this city were much interested to-day in a monster Oswego bass that was on exhibition at the meat market of L. Stanton in State street. The bass measured a full twenty-three inches in length, was 3½ inches across the back, and its side was over seven inches broad. The mouth was a cavernous opening that could easily have taken in a two-pound fish, and the monster this afternoon tipped the scales at 6¼ pounds, and when it was taken from the water two days ago it must have weighed seven pounds.

To John Gruner, of this city, belongs the honor of taking the fish from the water of Cayuga Lake. Mr. Gruner and his son John were at the lake Saturday trolling with minnows near Red Banks. They had already lost a big pickerel, when the bass struck and broke from the water. Mr. Gruner saw he had a big fellow and he made a careful fight that lasted a quarter of an hour before the big one was put into the landing net and drawn into the boat. The fish is the biggest bass taken from Cayuga Lake in many years.

CORTLAND, August 15.—W. R. Cole, who is spending a few weeks with a party of friends at Skaneateles Lake, reports that he has the honor of catching the largest trout that has been taken out of the lake in many years. It measured thirty inches in length and weighed 11½ pounds.—Syracuse Post-Standard.

Fined \$400 for Dynamiting.

A FISH dynamiter arrested by Game Warden W. F. Scott, on the Prickly Plan River in Montana, was sentenced by Judge Henry C. Smith, at Helena, last week, to pay a fine of \$400. The defendant, who was formerly a Helena business man of considerable prominence, pleaded guilty, and his counsel asked for clemency in consideration of his long residence and previous good repute. In passing sentence, Judge Smith said:

"What your counsel has stated is very true. You are a man who has been in business in this community, an intelligent man, a man who I understand has been fairly successful in your pursuits. Of course, in dynamiting fish you must have acted advisedly. I am informed by the game warden that you were very well posted as to the penalties for dynamiting fish, thoroughly understood the difference in penalty between seining them and dynamiting. I regard dynamiting fish as a very serious offense; it is an unnatural offense."

"Catching fish out of season, if there was a close season for fish, or occasionally transgressing the law by killing a grouse or prairie chicken out of season, is not the same character of offense as dynamiting fish at all. A man must be absolutely devoid of any sportsmanlike qualities who will dynamite fish. People who dynamite fish have been designated in the journals relating to sports of that kind as hogs, and it strikes me that is a very appropriate designation. One man is compelled by the law to catch fish with a hook and line, another man comes along and clandestinely drops a stick of giant powder into a hole and kills, not only the large fish that are good to eat, but every fish that is in the hole, and the fish food besides. Not only that, but the fish are mutilated and some of them rendered unfit for food. And in passing sentence upon you I desire to act in such a way as that others may thoroughly understand the situation. I don't care to impose a penalty that will be said is too severe; at the same time I believe that the Legislature must have

thoroughly recognized the heinousness of this offense by placing the minimum penalty at the sum of \$200.

"I don't want to make a martyr of you, and still I want to punish you, and I want to deter others from doing what you have done. My private information is that there is a good deal of dynamiting going on in the streams of this State. I shall impose a fine upon you, but I want to serve notice that the next man that comes here charged with the offense that you are charged with, if he is found guilty, and I am here, I shall certainly send him to the penitentiary."

"I have known you quite a number of years, and it is not an agreeable duty to pass sentence upon you, but I am bound to punish you for what you have done. I regard it, as I say, as a heinous offense, and I am surprised that a man of your intelligence and standing in the community should do such a thing. You knew it was against the law; it is the very worst infringement of the game law in my judgment. There is no excuse for it whatever."

"The sentence of the court is that you pay a fine of \$400, and that you stand committed to the custody of the sheriff until that fine is paid."

Fins.

FINS and wings, fish and birds, water and air, each of these pairs resembling the other, and so enabling us to study the more mysterious water creatures by what we can observe with greater ease in those that live in the air. Birds are heavy in the air, fish are light in the water; birds become light in the water and fish heavy in the air; and both pass through their own element in a way that is similar yet not the same. Fish use their tails and birds their wings as propellers, so when under water the diving bird flies with its wings, and when out of the water the flying fish floats on its great pectoral fins, and is driven forward by the force exerted by the tail before it left the water.

A bird like the gull with slow wing strokes and its habit of sliding through the air with motionless wings helps us to understand the use that a trout makes of its pectoral and ventral fins.

To raise itself from the ground a gull runs along first with uplifted wings, following up the impetus thus gained by powerful downward strokes, which quickly take it to a great height, when its flight can be changed to floating on outspread wings. Suspended thus in the air it is really from the weight of its body gliding down an inclined plane often at great speed. This falling force is easily directed upward by altering the angle at which the wings are set, and thus the perfection of aerial navigation depending on a heavy body and horizontal sails is attained. The tail, though never used as a propeller, is in constant use, acting either as a rudder or balance or as a powerful brake.

The trout swims through the water with its tail. It does not use its horizontal fins as propellers, and when going at great speed the tail actuated by the lateral movement of the backbone, is alone in action.

The nearest approach that we can make to this movement is with a single oar at the stern of a boat, which closely imitates the zigzag course of the upper ray of the fish's tail. A fan-like set of rays, the outer being the stiffer, while the inner ones are split into two about half way, make an elastic framework over which is stretched that wonderful membrane that becomes at its edge so fine that it is almost as impalpable as the water itself. The whole structure from its tough beginning at the body to its broadened soft ending forms a very perfect propeller.

It is in the horizontal fins that we see the likeness to wings, for the fish sets them to the different currents it is in, and rises and falls by their help, as the gull does when sailing in the air. A trout, however, can raise or lower itself in the water with no noticeable movement of fins or tail, and as it certainly does not depend upon an air-bladder to effect this, it must employ some other means.

To answer any puzzling question in natural history it is well to look for similar instances in other cases, and here we find the whale lowering its vast bulk through the water with ease, even after taking in gallons of air, which must make its body more buoyant. Now to do this it contracts its skin, and so lessens its bulk, becoming at once heavier for its size and able to sink. To raise itself its muscles are relaxed; its bulk is again increased, and so it becomes lighter. The trout is a mass of muscles, supported on a slight framework of bones, and as it floats when dead we may conclude that, like the whale, it has the power of contracting and expanding its body. When death relaxes its muscles the trout floats, and when alive it can so regulate their action that it is able to rise and fall without using fins or tail.

In a stream, however, the fins are all in use, and though the unconscious contracting and expanding of its bulk may be going on, they are its chief aids to reach any desired position or object. The angler well knows the resistance that can be offered by them, and the fish takes advantage of every current, setting its fins and straining rod and tackle in every possible way. To appreciate fully their effective force the fact that the fish is about the same weight as the water should not be lost sight of. The back fin acts as a keel, and with the tail and anal fin helps to balance the fish, which, strange to say, is top-heavy in the water. We are so wise that we never would have thought of making such a creature, and yet nature points out to us in a quiet way how very little we know and how much we have to learn.

In quite still water trout cruise about, fanning their tails and fins, and taking the flies without any fuss. When a party are so occupied, the dry fly, if well put on the water, is confidently approached, the jaws move, and the fish as he proceeds to lower himself is surprised to find that his freedom is gone. A wild rush is made, and the fight begins. In such still water every fin can be studied, and as the fish cannot get help from currents, his resistance is more deliberate, and it often takes a long time to tire him out. A favorite way to try to escape is by swimming slowly along, followed by a rush and spring out of the water. This violent exertion soon ends in defeat, and the trout with side up is landed.

A trout has eight fins—the pectorals and ventrals, the anal, caudal, adipose, and dorsal. The first four act more or less horizontally, although this is not the only motion

they are capable of. The remaining four are set vertically, and acting with the others complete the wonderful balancing and motive power of the fish.

In sharp turnings the lateral action of the backbone shows how the driving force is communicated to the tail, and when extra power of stroke is wanted the anal fin and after part of the body really constitute the propeller. The adipose fin is too pliant to be of service, but in the pike we find this and the dorsal represented by one large fin set near the tail, and forming with the anal and tail, or caudal fin, a propeller which gives the pike the power of making a quicker sudden rush than any other fresh water fish. The long shape of the body, too, is well suited for the dart-like flight through the water to which this fish trusts for safety and the capture of its prey. The pectoral and ventral fins are used especially in backing water, and the fish can disappear quietly in a ghost-like way by their help. The rush of this fish, whether it be from fright or when a bait tempts it from its lair, is a thing to see and remember.

The pike has seven fins—the single dorsal, caudal, and anal making on occasion a splendid propeller. The four others, besides being used for backing water, seem to suggest almost walking power, and are used for slow backward and forward progression in the water.

We see that in the water fish have little weight, and the frightened flying fish, shot out of the water by the action of its tail, becomes in the air a heavy projectile. Its great pectorals are spread, and its leap lasts as long as the forward force is greater than the force of gravity. So it does not fly as a bird flies, but floats through the air like a trout in the stream. This wonderful leap, which for convenience we may call flight, has a disappointing finish, for it ends in an awkward fall, which shows plainly how unlike true wings even these great fins are. The sailing of a gull on different planes of air helps us to understand the sailing of a trout in different currents of water, and so we see that fins and wings are near relations. The great fins of a flying fish are set high as in a bird, and consequently, although top-heavy under water, this wonderful fish's center of gravity is lowered the instant it leaves the water.

Both air and water have weight, and the same creature may be said to be heavy or light according to the element it happens to be in at the time. The diving bird becomes light and flies with its wings under water, and the flying fish becomes heavy and floats on its great fins through the air.

Wings for the air, fins for the water, and their action remains the same when the wings are used under water or the fins in the air.—E. F. T. Bennett in Badminton Magazine.

The Successful Man.

"WELL," said the business partner of the successful man, "how did you enjoy your trip? Seems to me you don't look quite as yellow as usual."

"I don't notice any improvement in my health myself," said the successful man. "Native air may suit some people, but it's my impression that a man has to stay in it all the time to get the good of it. If I'd never left it in the first place I'd have been all right to-day. They're a sleepy lot down there, though. They don't seem to notice that the world's moving or to care a continental if it does. Nine-tenths of them don't know the meaning of the word 'hustle.'"

"Well, we know the meaning of it here," said the partner. "Look at that batch of contracts piled up since you left. Look over the papers now, will you?"

"What's the use?" said the successful man, fretfully. "If you ever want to realize what a failure you are, just go to your home town and interview the village loafer. I did that."

"I hadn't seen Billy since I left the place to come to Chicago. I remember him as a hulking, overgrown boy, about five years older than I was, and even then he had acquired a reputation as the triflingest, no accountest cub in seven counties."

"I ran across him while I was out walking. He was sitting with his back against a big willow, well in the shade, fishing, and the minute he turned his head I knew him. I said: 'Hello, Bill! What luck?'"

"He looked at me in a puzzled way and pointed to the string of fish he had tied to a root of the willow. Then I sat down by him and began to talk to him. After a while he hauled in a big two-pound bass. 'That's good enough to eat, Henry,' he says. 'It's about noon now, I reckon.'"

"He started a fire. Then he groped in a hollow of the tree and pulled out about a dozen ears of green corn and a frying pan and some salt pork. He had some tins of stuff hidden there, too, and a big muskmelon and a chunk of bread rolled in a newspaper. First of all he coated the ears of unhusked corn with the mud from the bank and covered them with coals and then he cleaned and cut up the bass and got some slices of pork to frying. Next he shook out some corn meal on the newspaper and rolled the fish in it and got that to frying, and in about twenty minutes there was a meal ready that I'd have given \$50 to eat."

"I was asking him questions while he was cooking. He said he wasn't doin' much of anythin', specially in the summer. Not much of anythin' any time. He hadn't never married, so there wasn't no need of it. There was always birds in the air and fish in the river an' rabbits in the ground, an' there was corn growin' in the fields an' melons an' such. No need o' goin' hungry, and a man could always peddle a string o' fish or suthin' for what terbacker an' store truck he wanted. 'Winter time,' he said, 'I c'n do a few chores for my board an' lodgin', an' I play the fiddle for dances. But what's the matter with you Henry? Why don't you eat?'"

"I told him my diet was principally oxygenated wheat germs. 'What's them?' he asked."

"I explained and told him what dyspepsia was. He didn't know. Happy man!"

"Then he began to eat."

"What are you doin', Henry?" he asked, between mouthfuls.

"I told him, but the fact that I had been successful hardly seemed to impress him. He kept on questioning me."

"So you work all day from 7 or 8 o'clock in the mornin' an' sometimes till late o' night?" he said. "Then you have to eat this truck you tell me about an' have a misery in your stomach half the time! An' you lie awake nights an' can't git ter sleep! Can't eat good vittles, can't sleep, an' work all the time! What d'ye do it fer, Henry?"

"I don't know," I said.

"He threw away the last of the melon rind, sighed contentedly, and pulling a corn-cob pipe from his pocket, filled and lighted it. Then, leaving his seat on the log, he stretched himself out on the grass and smoked, looking at me thoughtfully the while. Presently he took his pipe from his mouth and said: 'Henry, I'm mighty sorry for you.'"

"I've been sorry for myself ever since," concluded the successful man.—Chicago News.

By the Stream.

Where the river seeks the cover
Of the trees whose boughs hang over,
And the slopes are green with clover
In the quiet month of May;
Where the eddies meet and mingle,
Babbling o'er the stony shingle,
There I angle,
There I dangle,
All the day.

Oh, 'tis sweet to feel the plastic
Rod, with top and butt elastic,
Shoot the line in coils fantastic,
Till, like thistle-down, the fly
Lightly drops upon the water,
Thirsting for the finny slaughter,
As I angle,
And I dangle,
Mute and sly.

Then I gently shake the tackle,
Till the barbed and fatal hackle
In its tempered jaws shall shackle
That old trout so wary grown.
Now I strike him!—joy elastic!
Scouring runs!—leaps acrobatic!
So I angle,
So I dangle,
All alone.

Then when grows the sun too fervent,
And the lurking trouts, observant,
Say to me, "Your humble servant!"
Now we see your treacherous hook!"
Maud, as if by hazard wholly,
Saunters down the pathway slowly,
While I angle,
There to dangle
With her hook.

Then somehow the rod reposes,
And the book no page incloses;
But I read the leaves of roses
That unfold upon her cheek;
And her small hand, white and tender,
Rests in mine. Ah! what can send her
Thus to dangle
While I angle?
Cupid, speak!
—Fitz-James O'Brien.

The A B C of the Fish School.

Away from imitations keep,
Be sure you "look before you leap."
Contrive to watch the little dun,
Desist from snatching minnows spun.
Eschew the luscious worm on hook,
For anything suspicious look.
Great anglers fish with tackle fine,
Holts were made for breaking his line.
Independent action take,
Jump, turn and twist, and head well shake.
Keep using your sagacity,
Likewise with some audacity,
Make brave to keep among the wet,
N. B.—The angler has a net.
Oh, yes! I speak with some authority,
Proved by the finny great majority,
Quick start with prompt temerity,
Run to your holt with all celerity.
Safest the trout that comes out late,
Turn early home and master fate.
Under the roots when breath is spent,
Vive la trouty! The rod is bent.
Wearing the gut—you know the game—
XX or drawn—it's all the same.
You're the biggest trout he ever ran,
Zounds! list the sulphury words of man.
—L. M. B. in London Fishing Gazette.

S'pose Fish Don't Bite at Fust.

S'POSE the fish don't bite at fust,
What be you goin' to do?
Chuck down your pole, throw out your bait,
An' say your fishin's threw?
Uv course you hain't; you're goin' to fish,
An' fish, an' fish, an' wait
Until you've ketched your basket full,
An' used up all your bait.

S'pose success don't come at fust,
What be you goin' to dew?
Throw up the sponge and kick yourself,
An' go to feelin' blue?
Uv course you hain't; you've got to fish,
An' bait, an' bait ag'in.
Bimeby success will bite your hook,
An' you will pull him in.
—Houston Post.

New Books Received.

Our Feathered Game. A handbook of the North American game birds. By Dwight W. Huntington. Charles Scribner's Sons, New York.
The Big Game Fishes of the United States. By Charles Frederick Holden. The Macmillan Co., New York.
Musings by Camp-Fire and Wayside. By William Cunningham Gray. Fleming H. Revell Co., Chicago.
Camp-Fires in the Wilderness. By E. W. Burt. National Sportsman Press, Boston.
My Dogs in the Northland. By Egerton R. Young. Fleming H. Revell Co., Chicago.
In and Around the Grand Canyon. By George Wharton James. Little, Brown & Co., Boston.
Bass, Pike, Perch and Others. By James A. Henshall, M.D. The Macmillan Co., New York.
The Sports of the World. Edited by F. G. Aflalo, Cassell & Co., New York.
"Practical Dog Education," by Recapper (Thos. C. Abbott), published by the M. T. Richardson Co., is a work of 38 pages, devoted to the education of setters and pointers in the best methods of work to the gun. The inductive method of teaching dominates the methods of the author, while he on the other hand, earnestly deprecates the unnecessary use of the whip and other forms of punishment.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

A Truthful Angler.

"Just throw me half a dozen of your biggest trout," said the man with the costly angler's outfit.

"Throw them!" exclaimed the astonished fish dealer. "That's what I said," replied the party of the first part. "Then I'll go home and tell my wife I caught them. I may be a poor fisherman, but I'm no liar."—Chicago News.

The Kennel.

Fixtures.

BENCH SHOWS.

Sept. 7-10.—Toronto Industrial Exposition's thirteenth annual show. Dr. A. W. Bell, Sec'y.
Sept. 4-5.—Newport, R. I., Kennel Club, Newport, R. I., Sept. 4 and 5.
Sept. 15-17.—Ottawa, Can., Kennel Club show. Robert McAllen, Sec'y.
Oct. 6-9.—Danbury, Conn., Agricultural Society's show.
Oct. 20-23.—Frederick County, Md., Agricultural Society show. J. Roger McSherry, Sec'y.
Nov. 17-19.—Boston, Mass., Terrier Club show.

FIELD TRIALS.

Aug. 31.—La Salle, Man.—Western Canada Kennel Club trials. H. S. Rolston, Sec'y, Winnipeg, Man.
Sept. 1.—Huron, S. D.—Minnesota-North Dakota Field Trial Association trials. Frank Richards, Sec'y, Peever, S. D.
Sept. 1.—Brandon, Man., Kennel Club trials. J. P. Brisbin, Sec'y.
Sept. 8.—Carman, Man.—Manitoba Field Trial Club trials. Eric Hamber, Sec'y, Winnipeg, Man.
Oct. 26.—Clare, Mich.—Sportsman's Field Trial Association trials. E. C. Smith, Sec'y, Midland, Mich.
Oct. 26.—Washington Court House, O.—Monongahela Field Trial Association trials. A. C. Peterson, Sec'y, Homestead, Pa.
Oct. 27.—Paradise Valley, Nev.—Nevada Field Trial Association trials. Dr. C. E. Wilson, Sec'y, Elko, Nev.
Nov. 2.—Washington Court House, O.—Ohio Field Trial Association trials. G. R. Haswell, Sec'y, Circleville, O.
Nov. 3-6.—New York.—Annual show of Ladies' Kennel Association of America.
Nov. 9.—Fourteenth annual beagle trials of the National Beagle Club of America. Charles R. Stevenson, Sec'y.
Nov. 9.—Missouri Field Trial Association trials. L. S. Eddins, Sec'y, Sedalia, Mo.
Nov. 9.—St. Joachim, Ont.—International Field Trial Association trials. W. B. Wells, Hon. Sec'y, Chatham, Ont.
Nov. 9.—Hutsonville, Ill.—Independent Field Trial Club trials. H. S. Humphrey, Sec'y, Indianapolis, Ind.
Nov. 9.—Western Irish Setter Club trials. Dr. T. L. Fenn, Sec'y, Chicago, Ill.
Nov. 10.—Hampton, Conn.—Connecticut Field Trial Club trials. F. W. Smith, Sec'y, New Haven, Conn.
Nov. 16.—Robinson, Ill.—Illinois Field Trial Association trials. W. R. Green, Sec'y, Marshall, Ill.
Nov. 23.—Robinson, Ill.—American Championship Field Trial Association trials. H. S. Humphrey, Sec'y, Indianapolis, Ind.
Dec. 1.—Clay City, Ind.—Indiana Field Trial Club trials. C. F. Young, Sec'y.
Dec. 5.—Thomasville, Ga.—Continental Field Trial Club trials. John White, Sec'y, Hempstead, N. Y.
Nov. 16.—Holmdel, N. J.—Pointer Club of America's trials. C. F. Lewis, Sec'y, New York city.
Nov. 30.—Chase, City, Va.—Virginia Field Trial Association trials. Charles B. Cooke, Sec'y, Richmond, Va.

A Brief Friendship.

OUR near neighbor is the owner of a very affectionate and beautiful coach dog, which was left in the charge of the care taker during the winter. This spring when we moved down there for the first time, Rak, as we called him, came over to see us at once, as though to bid us welcome. He came nearly every day, and went to each member of the family to be petted, and then returned home.

When we began to unpack, the dog was always on hand to superintend the job. Sometimes he would lie on the mat for a time, but never remained very long. One day he came with a bone wedged in his teeth, and plainly asked to have it removed. In fact, he made himself perfectly at home with us, although we never fed him.

When we found our neighbor was at his place again, we thought best that Rak should not come to us any more, and, much against our wish, we ordered him off, and after two or three attempts succeeded in driving him away. For several days after this he came to the gate entrance and looked up at the house with a pleading look on his face, and, while he slowly wagged his tail, said in language that was plain: "May I come up? I know you love me, and I love you. What have I done? We used to have good times together before you drove me away. Only say 'Hello, Rak!' and you will have me bounding to your side again." But the word was not spoken, and the dog now trots past our place without even looking at it. E. R. W.

Pointer Club Trials.

NEW YORK, Aug. 21.—The fourth annual field trials of the Pointer Club of America will be held at Holmdel, Monmouth county, N. J., commencing Nov. 16. The historic breeding estate of Holmdel exceeding 4,000 acres, over which the trials will be run, has been always noted as restricted grounds, and its owners have boasted that a gun has not been fired on the preserve since their occupancy. Quail have always been plentiful in that section, but un hunted; and the club may therefore consider the concession granted it as most desirable. The country thereabouts is open and free of scrub woods—distinctly a grain-raising section—and the field trials committee may therefore be congratulated on its selection.

The events to be run will be a repetition of last year, viz.: The Derby, Members' All-Age and Championship stakes. Entries to all but Members' Stake will close on Oct. 15. With the exception of the Championship Stake, which is open to the world, competition in the other events is confined to members. Messrs. Bernard Waters and G. Muss-Arnolt will officiate as judges. C. F. LEWIS, Sec'y.

Points and Flushes.

The premium list of the Danbury, Conn., Agricultural Society's annual dog show, to be held on Oct. 6-9, may be obtained on application to the secretary, Mr. C. E. Rundle. Mr. James Mortimer is the superintendent. Entries close on Sept. 22.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of *FOREST AND STREAM* offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First, \$50.00.

Second, \$25.00.

Third, \$15.00.

Fourth and Fifth, \$10.00 each.

Sixth to Eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, N. Y., on or before December 1, 1903.

American Canoe Association.

Twenty-fourth Annual Camp, Sugar Island, Near Gananoque, Canada, Aug. 7 to 21.

Friday, Aug. 14.—Event No. 14, novice sailing race, 3 miles—Weather, clear; wind, strong S. W.; sea, choppy: First, F. LeRoy Pratt, Winchester B. C., Pioneer II.; second, L. C. Kretzmer, Knickerbocker C. C., Papoose; third, T. Bentley, Grand Trunk B. C., Eva; fourth, R. H. Kretzmer, Knickerbocker C. C., Foggy Dew; A. W. Scott, Knickerbocker C. C., did not finish. Start, 11:33:00 A. M. Finish, 12:13:15 P. M. Winner's elapsed time, 40m. 15s.

Saturday, Aug. 15.—Extra Event No. 26, Atlantic division, sailing trophy, 3 miles—Weather, clear; wind, light; sea, smooth: First, F. C. Moore, N. Y. C. C., Zaidee; second, D. B. Goodsell, N. Y. C. C., Guenn; third, R. H. Kretzmer, K. C. C., Foggy Dew; fourth, L. C. Kretzmer, K. C. C., Papoose. Start, 11:47:00 A. M. Finish, 12:55:40 P. M. Winner's elapsed time, 1h. 8m.

Event No. 3.—Record sailing race, 4½ miles; time limit, 2½ hours—Weather, clear; wind, S. W., light; sea, smooth: First, H. D. Murphy, Winchester B. C., Bee; second, J. A. Newman, Winchester B. C., Damosel; third, W. I. Ladd, Winchester B. C., Pioneer II.; fourth, D. B. Goodsell, N. Y. C. C., Guenn; fifth, G. W. MacTaggart, N. Y. C. C., Torment; sixth, F. C. Moore, N. Y. C. C., withdrew. Start, 4:13:00 P. M. Finish, 5:27:38. Winner's elapsed time, 1h. 14m. 38s.

Monday, Aug. 17.—Event No. 8, one-man single blade paddling race, ½ mile, straightaway—Weather, clear; wind, light; sea, smooth: First, A. McNichol, Toronto C. C., Gyp; second, Chas. Booz, Grand Trunk B. C., —; third, Ernest J. Minnett, Grand Trunk B. C., Witch II.; fourth, F. LeRoy Pratt, Winchester B. C., —. Start, 10:20:50 A. M. Finish, 10:27:16 A. M. Winner's elapsed time, 6m. 26s.

Event No. 12, fours, single blade paddling race; ½ mile, straightaway—Weather, clear; wind, light; sea, smooth: First, O. J. Brownrigg, Gordon Brown, Chas. Boaz, E. J. Minnett, Grand Trunk B. C.; second, A. I. Ward, A. McLean, C. N. Marshall, A. L. Marshall, Grand Trunk B. C. Start, 10:48:35 A. M. Finish, 10:53:50 A. M. Time, 5m. 15s.

Event No. 10, tandem, single blade paddling race, ½ mile straightaway—Weather, clear; wind, light; sea, smooth: First, E. J. Minnett, Gordon Brown, Grand Trunk B. C.; second, C. N. Marshall, A. L. Marshall, Grand Trunk B. C.; third, O. J. Brownrigg, Chas. Boaz, Grand Trunk B. C.; fourth, F. LeRoy Pratt, J. A. Newman, Winchester B. C. Start, 11:24:51 A. M. Finish, 11:30:46 A. M. Winner's elapsed time, 5m. 55s.

Event No. 9, novice single blade paddling race, ½ mile, straightaway—Weather, cloudy; wind, fresh; sea, smooth: First, A. Murray Hannah, Grand Trunk B. C.; second, F. LeRoy Pratt, Winchester B. C.; third, B. Irving Rouse, Jr., Rochester, N. Y.; fourth, Ralph Britton, Gananoque, Canada. Start, 12:30:55 P. M. Finish, 12:38:05 P. M. Winner's elapsed time, 7m. 10s.

Event No. 20, war canoe paddling race, 1 mile, straightaway—Weather, cloudy; wind, light; sea, smooth: First, Grand Trunk B. C., Captain C. W. McLean; second, Y. M. C. A., Brockville, Captain Geo. W. Smith. Start, 1:46:36 P. M. Finish, 1:53:21. Time, 6m. 45s. Won by one length and a quarter.

Special, sailing race, off Gananoque Inn, 3 miles—Wind, strong breeze; weather, clear; sea, choppy. Racing canoes, 112 sq. ft. sail area: First, H. D. Murphy, Winchester B. C., Bee; second, G. W. MacTaggart, N. Y. C. C., Az Iz; third, W. J. Ladd, Winchester B. C., Pioneer II.; fourth, I. A. Newman, withdrew. Start, 5:01:45 P. M. Finish, 5:29:08 P. M. Winner's elapsed time, 27m. 23s.

Cruising canoes, 75 to 85 sq. ft. sail area: First, M. Ohlmeyer, Jr., K. C. C., Chiquita; second, R. H. Kretzmer, K. C. C., Foggy Dew; L. C. Kretzmer and A. W. Scott, withdrew. Start, 5:11:45 P. M. Finish, 5:45:00 P. M. Winner's elapsed time, 33m. 15s.

First prizes in each class presented by citizens of Gananoque.

Special, paddling race, off Gananoque Inn; ½ mile, straightaway; open canoe; single blade; down the wind—Weather, clear; wind, strong; sea, rough: First, Arthur McNichol, Toronto C. C., Gyp; second, E. J. Minnett, Grand Trunk B. C., Witch II. Start, 5:59:05. Finish, 6:02:00. Winner's time, 2m. 55s.

First prize presented by citizens of Gananoque.

Sailing and paddling courses not measured.

Tuesday, Aug. 18.—Event No. 2, record paddling race, ½ mile, straightaway; double blade—Weather, cloudy; wind, strong; sea, choppy; down the wind: First, H. D. Murphy, Winchester B. C., Bee; second, G. W. MacTaggart, N. Y. C. C., Torment; third, J. A. Newman, Winchester B. C., Damosel. Start, 10:37:15. Finish, 10:39:35. Winner's time, 2m. 20s.

Course not accurately measured.

Extra event No. 27, fours, paddling race; complimentary to "ex-Commodores"; course not measured nor officially timed: First, A. McNichol, Toronto C. C.; R. Britton, Gananoque, Can.; O. C. Cunningham, Medford B. C.; C. H. Parson, N. Y. C. C. Second, F. LeRoy Pratt, Winchester B. C.; ——— Walkling, Medford B. C.; W. J. Ladd, Winchester B. C.; H. D. Murphy. Third, ex-Com. MacKendrick, Ubuque C. C.; ex-Com. Thorn, Buffalo C. C.; Com. G. W. Gardner, Cleveland C. C.; ex-Com. Edwards, Peterboro C. C. Finish, 11:15:31 A. M.

Event No. 6, decked or open, canoe sailing race; 6 miles; time limit, 2½ hours—Weather, cloudy; wind, S. W., moderate; sea, smooth; racing canoes, 112 sq. ft. sail area: First, F. C. Moore, N. Y. C. C., Zaidee; second, G. W. MacTaggart, N. Y. C. C., Az Iz; third, H. D. Murphy, Winchester B. C., Bee; fourth, D. B. Goodsell, N. Y. C. C., Guenn; fifth, W. J. Ladd, Winchester B. C., Pioneer II.; J. A. Newman, withdrew.

Cruising canoes, 75 to 85 sq. ft. sail area: First, L. C. Kretzmer, K. C. C., Papoose; R. H. Kretzmer, A. W. Scott, M. Ohlmeyer, Jr., withdrew. Start, 12:32:00 P. M. Finish, racing canoes, 1:42:35 P. M. Winner's elapsed time, 1h. 10m. 35s. Finish, cruising canoes, 1:52:45 P. M. Winner's elapsed time, 1h. 20m. 45s.

Event No. 9, one-man, double blade, paddling race; ½ mile, straightaway: First, Ernest J. Minnett, Grand Trunk B. C., Witch II.; second, Arthur McNichol, Toronto C. C., Gyp; third, O. J. Brownrigg, Grand Trunk B. C., —. Start, 3:20:54 P. M. Finish, 3:27:12. Winner's elapsed time, 6m. 18s.

Event No. 13, fours, paddling, double blade race; ½ mile, straightaway—Weather, clearing; wind, light; sea, smooth: First, Ernest J. Minnett, A. McLean, O. J. Brownrigg, Chas. Boaz, Grand Trunk B. C.; second, A. McNichol, R. Britton, O. C. Cunningham, ——— Walkling, picked team, no one club. Start, 3:55:03. Finish, 4:01:22. Winner's time, 5m. 59s.

Event No. 16, open canoe sailing race; 1½ miles—Weather, clearing; wind, freshening; sea, smooth: First, G. W. MacTaggart, N. Y. C. C., Torment; second, F. C. Moore, N. Y. C. C., Kitt; third, J. E. Plummer, N. Y. C. C., ———; fourth, C. H. Parson, N. Y. C. C., Bertille; fifth, W. A. Furman, Park Island C. A., ———. Start, 4:26:00 P. M. Finish, 5:01:28 P. M. Winner's elapsed time, 35m. 28s.

Event No. 22, gunwale paddling race, double blade; ½ mile, straightaway: First, G. W. MacTaggart, N. Y. C. C., Torment; second, R. Britton, Gananoque; third, H. D. Murphy, Winchester B. C.; fourth, F. LeRoy Pratt, Winchester B. C. Winner's time, 1m. 35s.

Event No. 24, hurry scurry race, 300 yards; run, swim and paddle: First, F. LeRoy Pratt, Winchester B. C.; second, H. D. Murphy, Winchester B. C.; R. Britton, Gananoque, did not finish. Time, 1m. 32s.

Wednesday, Aug. 19.—Event No. 4, trophy sailing race; 9 miles; time limit 3½ hours—Weather, cloudy; wind, moderate to light; sea, smooth: First, J. A. Newman, Winchester B. C., Damosel; second, W. J. Ladd, Winchester B. C., Pioneer II.; third, F. C. Moore, N. Y. C. C., Zaidee; fourth, G. W. MacTaggart, N. Y. C. C., Az Iz; fifth, H. D. Murphy, Winchester B. C., Bee; sixth, D. B. Goodsell, N. Y. C. C., Guenn; seventh, L. C. Kretzmer, K. C. C., Papoose; M. Ohlmeyer, Jr., K. C. C., withdrew. Start, 10:56:00 A. M. Finish, 12:58:00. Winner's elapsed time, 2h. 2m.

Time by rounds:

Newman—Start, 10:56:10.					
First.	Second.	Third.	Fourth.	Fifth.	Finish.
11 13 17	11 30 45	11 51 03	12 10 31	12 35 18	12 58 00
Ladd—Start, 10:56:32.					
11 15 45	11 34 30	11 54 00	12 13 52	12 37 48	1 01 05
Moore—Start, 10:56:21.					
11 13 47	11 31 17	11 51 45	12 12 55	12 38 08	1 02 35
MacTaggart—Start, 10:56:12.					
11 14 00	11 34 27	11 52 17	12 13 35	12 38 47	1 03 05
Murphy—Start, 10:56:18.					
11 15 25	11 34 32	11 57 11	12 18 15	12 40 53	1 04 40
Goodsell—Start, 10:56:14.					
11 15 07	11 34 10	11 55 20	12 18 12	12 43 40	1 09 42
*Kretzmer—Start, 10:56:19.					
11 15 40	11 37 52	12 06 22	12 44 20	1 14 45	1 51 40
*Ohlmeyer—Start, 10:56:47.					
11 19 17	11 46 29	12 17 00	1 40 10	Withdrew.	

*80 to 85 sq. ft. sail area.

Wednesday, Aug. 19.—Event No. 7, trophy paddling race, double blade, 1 mile, straightaway—Weather, clear; wind, moderate; sea, smooth: First, Ernest J. Minnett, Grand Trunk B. C., Witch II.; second, Arthur McNichol, Toronto C. C., Gyp; third, A. Murray Hannah, Grand Trunk B. C.; ——— Marshall, Grand Trunk B. C., withdrew. Start, 11:32:12. Finish, 11:41:20. Winner's elapsed time, 9m. 8s.

Event No. 11, tandem paddling race, double blade; ½ mile, straightaway—Weather, clear; wind, brisk; sea, choppy: First, E. J. Minnett, A. M. Hannah, Grand Trunk B. C.; second, A. McNichol, R. Britton; third, Marshall, Schnafer (?), Grand Trunk B. C. Start, 12:46:10. Finish, 12:50:15. Winner's elapsed time, 4m. 5s.

Event 21, upset paddling race; about ⅛ mile, straightaway: First, A. McNichol, Toronto C. C.; second,

E. J. Minnett, Grand Trunk B. C.; third, R. Britton, Gananoque, Can.; F. LeRoy Pratt did not finish. Time, 1m. 50s.

Event No. 23, tail-end paddling race, 5 P. M.; about ¼ mile, down the wind: First, F. LeRoy Pratt, Winchester B. C.; second, A. M. Hannah, Grand Trunk B. C.; third, C. H. Parson, N. Y. C. C.; fourth, R. Britton, Gananoque; fifth, ——— Walkling, Medford B. C.; G. W. MacTaggart, N. Y. C. C., did not finish.

Event No. 25, tilting tournament, 5:30 P. M.: First round, Walkling and Britton beat Sparrow and MacTaggart; second round, Pratt and Newman beat Hannah and Minnett; third round, King and Ohlmeyer beat Murphy and Bowker; fourth round, King and Ohlmeyer beat Walkling and Britton, Pratt and Newman, Bye. Adjourned until next day.

Thursday, Aug. 20.—Event No. 25, tilting tournament, finals, 10 A. M.: F. LeRoy Pratt, tilter, J. A. Newman, paddler, Winchester B. C., vs. G. H. King, tilter, M. Ohlmeyer, Jr., paddler, Knickerbocker C. C. After a contest lasting over 1 hour and 25 minutes the judges, Messrs. J. W. Sparrow, Toronto C. C., and O. C. Cunningham, Medford B. C., declared the tournament a tie. The Regatta Committee has accordingly awarded first prizes to the tilters and second prizes to the paddlers of the two crews.

Friday, Aug. 21.—Event No. 1, record combined race, sail and paddle; 3 miles; time limit, 1½ hours—Weather, clear; wind, fresh; sea, smooth: First, G. W. MacTaggart, N. Y. C. C., Torment; H. D. Murphy and J. A. Newman, Winchester B. C., withdrew. Start, 11:02:30. Finish, 11:48:50. Time, 46m. 20s.

Event No. 15, club sailing race, 2 miles to leeward and return. Won by first three canoes of any club finishing. Race called at 2:15 P. M., there being but three entries from the Winchester B. C. and none from the N. Y. C. C., the Regatta Committee called the race off and substituted, therefor, sailing race of 1 mile to leeward and return, for individuals, but no club prize. Race called at 5 P. M.—Weather, cloudy; wind, S. W., strong; sea, heavy: First, H. D. Murphy, Winchester B. C., Bee; second, J. A. Newman, Winchester B. C., Damosel; W. J. Ladd, Winchester B. C., withdrew. Start, 5:28:15. Finish, 5:54:34. Winner's time, 26m. 19s.

Owing to the unsatisfactory weather prevailing a great part of the week, for sailing races, it was not deemed advisable to call event No. 5, Dolphin sailing trophy race. The Regatta Committee unanimously awarded the trophy for the year 1903 to W. J. Ladd, Winchester B. C. canoe Pioneer II., who finished second in the trophy sailing race.

Regatta Committee 1903, C. E. Britton, H. C. Hoyt, F. C. Hoyt, vice Friese, J. K. Hand, chairman.

Referees, H. M. Stewart, C. F. Walters and F. C. Moore.

Judges, J. B. Taylor, W. W. Crosby, E. A. Burns, J. W. Sparrow, J. R. Robertson, A. W. Scott, ——— Bowker.

Timekeeper, E. H. Demmler.

Starter, F. C. Hoyt.

Clerk of the course, J. K. Hand.

Officers for 1904: Com., C. F. Walters, Rochester C. C.; Sec.-Treas., J. S. Wright, Irondequoit C. C.

Atlantic Division: Vice-Com., L. C. Kretzmer, K. C. C.; Rear-Com., W. A. Furman, P. I. C. A.; Purser, M. Ohlmeyer, Jr., K. C. C.; Executive Committee, H. L. Pollard, N. Y. C. C.; N. S. Hyatt, Shattemuc C. C.; H. C. Allen, P. I. C. A.; Racing Board, H. L. Quick, Yonkers C. C.

Central Division: Vice-Com., H. W. Breitenstein, Duquesne C. C.; Rear-Com., C. P. Forbush, Buffalo C. C.; Purser, Frank C. Demmler, Duquesne C. C.; Executive Committee, Jesse J. Armstrong, Deowainsta C. C.; J. S. Wright, Irondequoit C. C.; Racing Board, H. M. Stewart, Rochester C. C.

The Northern Division has elected Mr. E. J. Minnett as its Racing Board member. The Eastern Division has elected Mr. Paul Butler to a like position, with Mr. H. D. Murphy as alternative.

A. C. A. Membership.

THE following have been proposed for membership to the A. C. A.: F. W. Bodwell, Manchester, N. H.; John R. Bowker, Waltham, Mass.

Atlantic Division—Louis Reichert, Carl Moore, Geo. H. King, A. Wenworth Scott and Charles H. Parsons.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

SEPTEMBER.

- 4-5. Eastern, open, Marblehead.
5. Seawanhaka Corinthian, club, Oyster Bay.
5. New York C. C., Y. R. A. of Gravesend Bay.
5. Royal Canadian, cruising race, Toronto.
5. Southern, Fornaris cup, New Orleans.
5. Indian Harbor, Y. R. A. of L. I. Sound, fall regatta.
5. Eastern, special, open, Marblehead.
5. Chicago, special, Lake Michigan.
5. Columbia, cruise to Indian Harbor.
5. Hempstead Bay, open.
5. Penatquit Corinthian, special, Bay Shore.
5. Beverly, open, Mattapoisett.
7. Indian Harbor, club, Greenwich.
7. Beverly, open sweepstake, Monument Beach.
7. Atlantic, club, Sea Gate.
7. Moriches, annual, open.
7. Seawanhaka Corinthian, club, Oyster Bay.
7. Jamaica Bay Y. R. A.
7. Larchmont, fall regatta, Larchmont.
7. Lynn, Y. R. A., open, Nahant.
7. Williamsburg, cruise.
7. Norwalk, Y. R. A. of L. I. Sound, annual.
7. Sachem's Head, Y. R. A. of L. I. Sound, annual.
7. Penatquit Corinthian, open, Bay Shore.
- 9-11. Columbia, races for Webb cup, Chicago, Lake Michigan.
- 10-12. Seawanhaka Corinthian, Y. R. A. of L. I. Sound, specials, and fall regatta.
12. Keystone, open, Woodmere, L. I.
12. Beverly, seventh Corinthian, Monument Beach.
12. Bay State, Y. R. A., open, Lynn Bay.
12. Chicago, handicap race to Kenosha.
12. Columbia, fall regatta, open, Chicago, Lake Michigan.

12. Royal Canadian, Prince of Wales cup race, Toronto.

19. Chicago, special, Lake Michigan.

19. Seawanhaka Corinthian, club, Oyster Bay.

19. Larchmont, schooner cup race, Larchmont.

19. Atlantic, fall regatta, Sea Gate.

19. Bensonhurst, Y. R. A. of Gravesend Bay.

19. Manhasset Bay, Y. R. A. of L. I. Sound, fall regatta.

26. Riverside, Y. R. A. of L. I. Sound, fall regatta.

26. Seawanhaka Corinthian, club, Oyster Bay.

26. Chicago, handicap, Lake Michigan.

27. Williamsburg, open, fall regatta.
- OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.

3. Columbia, special, Lake Michigan.

5. Southern, fall, New Orleans.

10. Columbia, special, Lake Michigan.

17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

With the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.

Second prize, \$50.00.

Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

America's Cup Races.

Second Race, Tuesday, Aug. 25.

A BRIEF paragraph in our last issue stated that Reliance won the second race for the America's Cup by 1m. 19s. corrected time. The boats covered a triangular course of 30 miles and, everything considered, it was a very fairly interesting and conclusive race. Strange as it may seem, Reliance, in all her trials with Constitution and Columbia, had never been tested with those boats on a broad reach and in a fresh wind. So in a measure her speed on that point of sailing was problematical, but the impression prevailed that this was her poorest point of sailing. As it turned out, Shamrock III. sailed a wonderful race, and Reliance was given a run for her money from start to finish. The rival skippers and crews did well by their boats, and very few mistakes were made on either hand.

In the morning the prospects were for a light weather race, and so it turned out. The sea was smooth and the wind averaged from seven to twelve miles. Shamrock III. was supposed to be at her best under such conditions.

It was just after eight bells when Reliance and Shamrock left their moorings in the Horseshoe in tow. Mainsails were hoisted on both boats as they were towed out to the lightship, and jibs and staysails were sent up in stops. After Reliance's big club topsail had been set, her topline was cast off and her jib broken out. Although Shamrock cast off her tow line soon after Reliance did, some time elapsed before her club topsail was sent aloft. Shamrock was carrying a new mainsail and club topsail, and these looked very much better than the ones carried in the previous race.

The tug Navigator arrived at the lightship about 10 o'clock. On board was the Regatta Committee, ex-Com. S. Nicholson Kane and Messrs. Newbury D. Lawton and Edward H. Walls. The wind enabled the Regatta Committee to lay their course from the lightship, and the compass courses for each leg were accordingly signaled. The first leg was S. 10 miles, the second was N. E. by E. ½ E. 10 miles, and the third was N. W. by W. ½ W. 10 miles. Making the first leg a beat, the second a broad reach and the third a close fetch. One towboat started off to place the marks and the tug Coastwise followed along later to act as guide boat to the yachts.

Navigator was anchored W. of the lightship, and at quarter of eleven the preparatory gun was given. The wind was still light, but it had increased in strength a little. At the time the preparatory signal was given both boats were on the starboard tack with Reliance on Shamrock's weather quarter. As they approached Navigator both skippers brought their boats up into the wind, killing their headway. Just before the warning gun was fired, both gybed and stood down the line toward the lightship. Reliance was in the weather berth, but Shamrock forereaching fast pulled out ahead and to windward. Reliance gybed over and headed for

the W. end of the line, while Shamrock hauled around the lightship. After Shamrock had gone around the light vessel she jogged along after Reliance. When about half way between the lightship and the committee boat Reliance was put on the starboard tack and crossed the line 36s. after the gun. It was apparent that Wringe was going to take the full two minutes allowed at starting, but the timekeeper on Shamrock III. must have been slightly in error, for the boat did not cross until 19s. after the gun, and was accordingly handicapped that time. The times at the start were: Reliance, 11:00:36; Shamrock, 11:02:00.

As Shamrock crossed the line, Reliance was put on the port tack, and the challenger also took a port tack as soon as she was clear of Navigator. Wringe profited by the blunders he made in the first two races, and kept between the defender and the shore. In a S. breeze the boat nearest to the beach gets the advantage. Reliance was quite a distance out on Shamrock's weather quarter.

Both boats were moving fast, and their baby jib topsails appeared to be lifting them out a good deal. Reliance was, as usual, being sailed very close, while Shamrock was not pinched so much. The breeze seemed to be stronger under the Jersey beach, and several fresh puffs laid the boats well out.

At 11:42 Reliance was put on the starboard tack. A thick haze had obscured the guide boat, but it was thought that Reliance ought to come pretty near to fetching the mark. Shamrock held her port tack over a minute longer than Reliance did, and when she took the starboard tack she was well to windward of the defender.

When the mark boat was made out it was evident that both boats had overstood the mark, and Shamrock had thrown away over a minute by holding the port tack longer than Reliance did. Sheets were eased a little, and the boats made fast time running down to the mark. At 12:17 Reliance's baby jib topsail was taken in and Shamrock's followed just over a minute later. Barr set a reaching jib topsail in stops on Reliance, while Wringe had a balloon put up. Wringe's men worked very much cleaner and smarter at this mark than Reliance's men did.

The time over the first leg of the course follows:

	Start.	Turn.	Elapsed.
Reliance	11 00 36	12 21 08	1 20 32
Shamrock	11 02 00	12 23 40	1 21 40

Reliance gained 1m. 8s. on this leg, but if the 19s. that Shamrock was handicapped at the start is deducted from this, Reliance only beat Shamrock 49s. in the ten-mile beat.

It was a broad reach to the second mark, and the boats had the wind just abaft of the starboard beam. Shamrock had her balloon jib broken out before Reliance's No. 1 jib topsail was drawing. It turned out that Wringe had used the best judgment in setting a balloon, as the wind was far enough aft for it to draw well.

Barr took in his staysail as soon as the jib topsail was drawing, and a balloon staysail was set in its place. On Shamrock the jib and staysail were both taken in. Four minutes after Reliance had rounded Barr saw that a balloon jib was the only sail for that leg, and accordingly the jib topsail was taken in and the balloon jib was sent up in its place. Two minutes was consumed in making this change, and Shamrock made quite a gain. Wringe kept well to weather of his course, and all his sails were trimmed a little flatter than Reliance's.

The wind had been working to the W., and Shamrock's spinnaker pole was put in place on the starboard side at 12:36. Reliance's pole was also run out and the spinnakers were sent up to the mast heads and out to the end of the poles on both boats. Barr had his spinnaker broken out first, and the pole was allowed to run well forward in order to make it draw. Shamrock's spinnaker was not broken out for over a minute after Reliance's was. As long as spinnakers could be made to draw well Reliance gained, as running is one of her best points of sailing. The wind began to work back to its original quarter, and Reliance's spinnaker was lowered at ten minutes of twelve, and the balloon did better work. Shamrock hung on to her spinnaker six minutes after Reliance had taken her's in.

The second mark had also been obscured by haze, and Reliance was within a mile of it when she picked it up. Both boats had stood to leeward of the mark, and sheets had to be flattened down in order to leave the mark to port.

The times for the second leg of the course follow:

	First Turn.	Second Turn.	Elapsed.
Reliance	12 21 08	1 18 07	0 59 59
Shamrock	12 23 40	1 22 02	0 58 22

Reliance gained 1m. 23s. on the broad reach of ten miles.

Barr gybed around the mark without taking in his balloon jib topsail, thinking he could carry it on the leg home. The wind had hauled a little and it was a close reach back to the finish line.

Shamrock's balloon had been taken in before she reached the mark and her jib and staysail had been set in stops and broken out. Some two minutes after gybing around the mark Reliance's balloon was taken in, and her jib and staysail were broken out. A baby jib topsail was set flying on Shamrock soon after she gybed around the mark. Barr sent his baby jib topsail aloft in stops, but it was not broken out.

The wind had lightened a bit, but both boats were moving along at a smart clip. When those on Reliance could pick up the lightship it was found they were to windward of their course. At eight minutes of one the baby jib topsail was broken out on Reliance. This sail was carried just over ten minutes, when it was lowered and a No. 2 jib topsail was hoisted in its place. The baby jib was taken in on Shamrock also, and a reaching jib topsail was set and drawing soon after Reliance's was.

Reliance crossed the finish line at 2:15:30 and Shamrock at 2:20:10.

The challenger was so close behind that until she really crossed the line and her time was taken few were sure which boat had really won.

The elapsed time over the third leg of the course follows:

	Second Turn.	Finish.	Elapsed.
Reliance	1 18 07	2 15 30	0 57 23
Shamrock	1 22 02	2 20 10	0 58 08

Reliance had beaten Shamrock 45s. on the close reach of ten miles.

The summary follows:

	Start.	Finish.	Elapsed.	Corrected.
Reliance	11 00 36	2 15 30	3 14 54	3 14 54
Shamrock	11 02 00	2 20 10	3 18 10	3 16 13

Reliance wins by 1m. 19s. corrected time.

Fourth Day, Thursday, Aug. 27.

Reliance carried another gaff in Tuesday's contest in place of the one used in the first two races. The original spar buckeled slightly and had been sent up to Erie Basin to be strengthened and straightened. The gaff that was substituted was used on Reliance in some of the races off Newport. A measurement of the spar was necessary, and Mr. Charles D. Mower went to the Horseshoe on Tuesday, but after measuring the gaff found it to be the same length as the one originally used, and consequently there was no change in the racing measurement.

Reliance crossed the finish line on Thursday 6m. 30s. after the time limit of five and one-half hours had expired. The race was a most uninteresting one, and was hardly more than a procession from the start. Reliance showed remarkable speed in the light air, and the way she dropped Shamrock III. was a revelation. Reliance and Shamrock III. left their moorings at 8 o'clock in tow.

When the boats got out to the lightship the wind was light from the S. E., and the sky was overcast. The prospects were for a paltry and fluky day, and even at that time there was little hope of the boats being able to finish within the time limit.

The committee boat Navigator was on hand bright and early, and she anchored S. W. from Sandy Hook Lightship. It was about half past ten when signals were hoisted on the committee boat, and these read that the course would be fifteen miles to windward and return, and that the compass course was S. E. from the light vessel.

The yachts were moving slowly along with their biggest club topsails set, and baby jib topsails had been sent up in stops. Reliance seemed a little livelier than Shamrock, but her larger sail area gave her more life. Shamrock broke out her jib topsail in order to enable her to maneuver more smartly. The baby jib on Reliance was broken out soon after Shamrock's.

At 10:45 the preparatory gun was given. At this time Wringe rather had the best of Barr, but having a slower boat, he was unable to hold his advantage. As the warning gun sounded, both boats were on the starboard tack heading E., but they were kept off and were headed back toward the line. Although the wind was very light—about four knots—the maneuvering was the keenest yet seen in any of the starts. Both boats were close hauled, heading toward the light vessel, with Reliance on Shamrock's weather, two minutes before the starting gun. Reliance drew ahead of Shamrock and passed to the E. of the lightship. Here she tacked, but still kept Shamrock to leeward. When the starting gun was fired both were on the port tack. The boats were kept off and headed for the line. Reliance, with more headway on, passed Shamrock, and when clear of the lightship, was brought up close on the wind and sent across the line 41s. after the handicap gun. Shamrock was some distance behind, and was handicapped 1m. 42s. The boats were officially timed at 11:02. Shamrock took a starboard tack soon after crossing, and Reliance followed suit. Reliance was eating out to windward all the time, while Shamrock kept off and was allowed to foot.

The boats had a head tide and the wind kept hauling and backing constantly, but the shifts did not favor one boat more than the other. After holding the starboard tack some twenty minutes, Shamrock was again put on the port tack. Reliance crossed her bow with a good margin to spare, and after doing so she was also put on the port tack. Reliance held the port tack for over an hour, and she then tried a starboard tack again. After three minutes of this she was put back on the port tack.

Five minutes after Reliance tacked to starboard Shamrock did likewise, and less than a minute later Reliance followed. Reliance seemed to be improving her position steadily, and she was a long distance ahead. At two minutes after one Shamrock was again put on the port tack, and fifty seconds later Reliance was also put about. Reliance held on this tack for a little over a quarter of an hour, when she went about; three minutes later Shamrock followed. Just before half past one Reliance took a port tack, which she held for less than three minutes, and then went back to the starboard tack. While Shamrock was a long distance behind she was holding a better breeze and was cutting down Reliance's lead somewhat.

Shamrock was put on the port tack at 1:40, and as she did so, ran out of her favoring breeze. Reliance took a port tack a little less than three minutes later, which she held for four minutes, and then Barr put her on the starboard tack. Shamrock took the starboard tack a little over a minute later. At 1:55 Reliance took a port tack and headed for the mark. Shamrock was a long distance behind. The times for the fifteen-miles beat follow:

	Start.	Turn.	Elapsed.
Reliance	11 02 00	1 55 15	2 53 15
Shamrock	11 02 00	2 07 46	3 05 46

Reliance had beaten Shamrock 12m. 31s.

The breeze was very light, and as the tide had turned, the boats had to stem it all the way back to the finish.

Shamrock's crew were smarter in setting their balloon and spinnaker than Reliance's were, and better judgment was used on the American boat in the trimming of the light sails. At half past three the wind let up a lot, but it picked up again after a little. Reliance's spinnaker was taken in, and she was headed up quite a bit in order to keep her balloon drawing and also to make allowance for the tide, which was setting down to the E. Just after four o'clock the spinnaker was again set on Reliance. It was apparent that she could

Shamrock.

not finish within the time limit, and at 4:32 a gun was fired from Navigator, and a signal was set, which signified that the race was off for the day. Reliance took in her balloon jib topsail before reaching the line, and she crossed at 4:38:30. Both boats were picked up by their tenders and towed back to their moorings.

Fifth Day, Saturday, Aug. 29.

The race that was to have been sailed between Reliance and Shamrock III. on Saturday was postponed on account of a heavy E. N. E. gale that had been blowing since Friday morning. There was a big sea running off Sandy Hook, and altogether it was not a fit day to send the big machines over an outside course. Col. Sherman-Crawford and Mr. Gildowney went aboard Sunbeam, Reliance's tender, early in the morning and conferred with Mr. C. O. Iselin, and they decided it would not be safe or wise to race the two yachts, and the Regatta Committee was notified in writing. This is the first time a race for the America's Cup had ever been postponed on account of too much wind. The next race was scheduled for Monday, Aug. 31, and will be continued on consecutive days, excepting Sundays, until three out of five races have been determined.

Sixth Day, Monday, Aug. 31.

The storm blew itself out on Sunday, and on Monday there was but little wind. The day was anything but pleasant, and the sky was still overcast, and the easterly breeze made the atmosphere raw and uncomfortable.

The two yachts were towed from the Horseshoe, where they had ridden out the gale in safety, out to the lightship. Reliance set a medium-sized club topsail, and a still smaller one was sent up on Shamrock.

The wind was E. N. E., and the Regatta Committee found it impossible to lay a windward course from Sandy Hook lightship, and accordingly Navigator steamed about three miles S., where she was anchored, and the tug Unique anchored at the other end of the line. During the delay, caused by the change in the starting line, Wringe hoisted a larger club topsail in place of the one originally set. The course signalled from Navigator was E. N. E.

It was 11:30 when the preparatory gun was given. The tide was running flood, and there was a long roll coming in from the E. The wind was light and did not exceed five or six knots.

Reliance's baby jib topsail was sent up in stops soon after the preparatory signal. At 11:40 the warning gun was fired, and at this time the boats crossed the line with Shamrock ahead and Reliance out on her weather quarter. After crossing the line both skippers kept their boats off, and they stood back again. The challenger had worked out on to Reliance's weather bow. Three minutes before the starting signal the boats were

running before the wind with sheets aft. Then they hauled on the wind and stood on toward Navigator. Shamrock was put on the starboard tack a little over a minute before the gun. Reliance was just able to cross Shamrock's bow, and after doing so she was put on the starboard tack. Reliance's jib topsail had been broken out, and both boats were reaching along the line. When the starting gun was heard Reliance was to leeward of Shamrock, and both boats crossed on the starboard tack. While Shamrock crossed in the weather berth, Reliance had her wind clear. Both boats were timed at the start at 11:45:26.

Barr was rapping Reliance off and trying to draw clear of Shamrock, while Wringe was pinching his boat in an effort to get her further out to windward. The boats were catching the rollers about abeam on this tack, and they were not bothering them any.

Five minutes after the start Shamrock took the port tack, and Reliance followed a few seconds later. The boats were now catching the seas under their weather bows, and while both were jumping about quite a little, Shamrock was making rather better weather of it. After holding the port tack for seven minutes Reliance was again put on the starboard tack, and Shamrock followed at once. Shamrock was footing fast and doing pretty well. The wind was veering a little all the time, and first one boat would get a lift and then the other. Finally the wind headed both craft off quite a little, and at 12:10 Wringe put Shamrock on the port tack. About a minute later Reliance also took a port tack.

Although the sea seemed to shake Reliance up more than it did Shamrock, she improved her position steadily. At four minutes past one Reliance went back to the starboard tack, which she held for three minutes, and then went back to the port tack. Just after half past one Shamrock went on the starboard tack, and less than three minutes later Reliance followed. Reliance was now a long distance out on Shamrock's weather bow.

At 1:43 Reliance took the port tack, and four minutes later was put back on the starboard tack, which she held for ten minutes. At 1:58 Reliance went on the port tack, as did Shamrock a few seconds afterward. Reliance's baby jib topsail was taken in, and a slightly larger one was substituted. At 2:33:15 Reliance tacked to starboard, and Shamrock did likewise at once. Reliance was put back on the port tack nine minutes later. Shamrock held her starboard tack three minutes longer and then she tacked to port also. Reliance was again put on the starboard tack at 2:52:20, and her jib topsail was taken in and her balloon set in stops. Five minutes later Reliance took the port tack and stood for the mark, which she rounded at 3:00:35. The balloon jib was broken out on Reliance smartly, and everything was put in shape for the run home.

At 3:06 Shamrock was put on the starboard tack, and five minutes later she took the port tack and headed for the mark. She was timed at 3:20:57. After gybing, her balloon was broken out and she stood on after Reliance.

The times for the fifteen-mile beat follow:

	Start.	Turn.	Elapsed.
Reliance	11 45 26	3 00 35	3 15 09
Shamrock	11 45 26	3 20 57	3 35 31

Reliance had beaten Shamrock 20m. 22s.

The spinnaker was not broken out on Reliance until 3:12, although the pole had been run out and the sail hoisted in stops some time before. It was taken in at 3:19, as it was now drawing well and was killing the balloon.

The tide had turned and the boats were again bucking it. Shamrock's spinnaker pole was run out and her headsails were lowered in order to give her balloon every chance. Just after 4:30 Reliance again set her spinnaker, as the wind had gone to the E. again. Shamrock broke hers out three minutes later. At 4:51 Reliance's spinnaker was taken in, but at five minutes past five it was again set.

At quarter past five the time limit gun was fired, and signals were hoisted on the committee boat, signifying the race was off. Shamrock was far astern, and could hardly be made out through the haze.

Tuesday's No Race.

THE third America's Cup race, unfinished on Monday and postponed to Tuesday, was, because of the unfavorable weather conditions and lack of a sailing breeze, again deferred.

Annisquam Y. C.

ANNISQUAM, MASS.,

Friday, August 14.

The most successful series of races of the season were the Y. R. A. open events of the Annisquam Y. C. sailed in Ipswich Bay on Friday and Saturday, August 14 and 15. On Friday there was a southwest breeze light and strong. In the 25-footers, was first over the starting line, but Chewink III. went into the lead on the first leg and remained there to the finish, while Seboomook found her chance in the strong breeze and finished second. In the 22-footers Tayac got the start and led to the first mark. On the second leg Opitsah V. and Medric passed her, but on the beat home she went into first place again. In the 18ft. class, Arrow got the best of the start, and was never headed. In the first handicap class, Kit easily led to the finish, but lost to Osprey on corrected time. Princess won easily in class A, handicap Princess won easily. The Swampscott

The second race of the Y. R. A. open series of the

AMERICA'S CUP RACES—RELIANCE WINNING, AUGUST 25.
Copyright by James Burton, New York City.

Annisquam Y. C. sailed on Saturday, was the more largely attended of the two. It drew the largest attendance that has been seen in a Massachusetts Bay race for years. There was a fine southwest breeze blowing, and the racing was good. In the 25-footers, Great Haste got the best of the start, and was in the lead at the first mark. On the second leg Sally VII. went up by Great Haste, as did Chewink II. On the beat home Great Haste went up again and finished first. In the 22-footers Opitsah VII. got the start and led all the way around until near the finish, when Urchin and Athlon got a fluke and went up by her, finishing first and second. In the 18-footers, Arrow got the start and led all over the course. Catspaw won a close race in the dory class. In the first handicap Osprey was first by a good margin. In the second handicap class, Princess again won easily. The summary:

East Gloucester Y. C.

GLOUCESTER, MASS.,

Thursday, August 13.

The most largely attended race of the season, up to that date, was the Y. R. A. open race of the East Gloucester Y. C., sailed off Gloucester Harbor Thursday, August 13. There was a good breeze and fine racing was enjoyed in all classes. In the 25-footers, Great Haste got the start and she held the lead all over the course, while Sally VII. and Chewink III. had the hottest kind of a scrap for second place. In the 22-footers Medric held the lead until near the finish, when Opitsah V. and Chief got a fluke and came up on her, Opitsah finishing first and Chief second. There were only three seconds between the three. In the 18ft. class, Arrow got the start and led all over the course. In the interclub dory race, Red Devil and Barbara, Swampscott boats, finished first and second. In the first handicap class, Kit led around the course. In the second handicap class, Twinkle sailed a great race and finished first, but lost to Lobster on time allowance. The summary:

Class D—25-footers.		
Great Haste, T. K. Lothrop, Jr.	Elapsed.

Cape Cod Y. C.

PROVINCETOWN, MASS.,

Thursday, August 20.

The opening race of the three days' series of Y. R. A. open events of the Cape Cod Y. C. was sailed in Cape Cod Bay on Thursday, August 20, in a light northerly breeze. In the 25-footers, Sally VII. got the start and led all over the course. In the 22-footers, Opitsah V. won a good race. Mildred II., a fast 21-footer, won from Usona. The 18-footers were all in a bunch at the starting line. They kept close together all over the course, Aspinquid getting first place and Domino a close second. The summary:

Class D.		
Sally VII.	Elapsed.	
Chewink.	1 48 12	
Great Haste.	1 51 39	
Early Dawn III.	1 53 10

Osprey.	2 05 30	

Friday, August 21.

The second race of the Cape Cod series was sailed in a light northerly breeze. In the 25-footers Great Haste got the start and led all over the course. In the 22-footers, Tayac went away first and was never headed. Miladi II. and Miss Modesty had all the best of the start in the 18-footers, and Miladi II. came home a winner by a longer margin than is usually found in this class. The summary:

Class D.		
Great Haste.	Elapsed.	
Sally VII.	2 52 34	
Chewink III.	2 53 41	
Calypso.	2 59 14

Saturday, August 22.

For the last race of the Cape Cod series there was a stiff southwest breeze and a lump of a sea. It was Calypso weather in the 25ft. class, but Sally VII. got away from her, and finished over 4 minutes ahead. The 22-footers got away together, and Chief led all the way around. Opitsah carried away her bobstay before the start. There was another close race between the 18-footers, in which Miladi II. and Domino finished first and second. The summary:

Class D.		
Sally VII.	Elapsed.	
Calypso.	0 53 31	
	0 57 31	

Class E.		
Chief.	0 58 12

Aspinquid.	1 13 11	

Manchester Y. C.

MANCHESTER, MASS.,

Monday, August 10.

Fluky weather conditions almost made a fizzle of the Y. R. A. open race of the Manchester Y. C. sailed off West Manchester on Monday, August 10. The wind was about south, and very unsteady. In the 25-footers, Chewink got the start and led to the first mark. On the second leg Great Haste got a streak of wind which pulled her out far ahead while Chewink was becalmed. Great Haste finished first, with room to spare. In the 22-footers, Opitsah V. led to the first mark, and Medric pulled ahead on the second leg. Opitsah V. went hunting for wind on the run home, and succeeded in getting first place. In the 18-footers, Arrow pulled out a lead soon after the start, which she held all over the course. Sally IV., in the handicap class, made the fastest time over the course with the aid of flukes. The summary:

Class D—25-footers.		
Great Haste, T. K. Lothrop, Jr.	Elapsed.	
Chewink III., F. G. Macomber, Jr.	2 34 00

Boston Y. C.

BOSTON, MASS.,

Wednesday, August 12.

A club race of the Boston Y. C. was sailed off the Marblehead station of the club on Wednesday, August 12, in a moderate northwest breeze. Sally VII. and Chewink III. had a great battle. Chewink III. got the start, but on the reach Sally VII. pulled through her lee and turned the weather mark first. Chewink III. caught Sally on the next leg, but Sally tried to force a passage inside of her and they came together. On the beat home Sally went out ahead and finished first. There were poor starts in the 22-foot class, Chief going over first. On the first leg Opitsah V. caught Chief and took the lead, but not until Chief had carried away her steering gear. Opitsah led the rest of the way around. In the 18-footers Chance got the lead on the first leg, and she held it to the finish. Chasca was first in the first handicap, and Clarice won on time allowance in the second handicap. The summary:

Class D—25-footers.		
Sally VII., L. F. Percival.	Elapsed.	
Chewink III., F. G. Macomber, Jr.	1 41 30	
	1 42 52

Nobnocket Y. C.

VINEYARD HAVEN, MASS.,

Thursday, August 13.

A race of the Nobnocket Y. C. was sailed off Vineyard Haven on Thursday, August 13, in a stiff southwest breeze. The feature of the day was the race of the junior knockabouts, in which Gull, sailed by Miss Edith Carey, with two girl companions as crew, won by a long margin. The summary:

Stuyvesant Y. C.

New York, Aug. 31, 1903.—The fourteenth annual regatta of the Stuyvesant Y. C. will be held on Sunday, Sept. 20, over the club course, Port Morris to Gangway Buoy, starting at 11 A. M. Entries should be addressed to J. Kraus, chairman Regatta Committee, East 132d Street and Locust Avenue, City.

Correspondence.

Editor Forest and Stream:

Permit me space in your columns for a few remarks on the challenger and challenged, or should I more correctly say "defender," the Shamrock III. and the Reliance. I have been struck by the claims made on behalf of these two boats by their respective partisans, resulting in some curiosity on my part as to the strength of the foundation therefor. Dealing first with the Reliance, does it not seem that her superiority is to be gauged by the amount by which she is superior to the Constitution? in which case, though no doubt the best defender yet produced, she is not so very much so. I do not think that her superiority to the Columbia in the latter's apparent present form is the true test. It seems to be altogether out of the question that in two years of idleness the Columbia should have so much deteriorated or the Constitution so much improved as to account for the Columbia's being so much behind the Constitution in the late trial races; and I venture to submit the theory that the difference is to be found in the handling. It must be borne in mind that Barr—who appears to be unexcelled, if indeed equalled, as a yachting skipper—is transferred from the Columbia to the Reliance. I would like to see a match between the Columbia with Barr back at her wheel and the Constitution. If the result of such a match put Constitution still as much superior to the Columbia as the recent trial races seemed to place her, it would be fair then to conclude either that the Columbia has gone back, or that the Reliance is really a wonderful improvement on any racing machine yet built.

Taking up Shamrock III., it has seemed strange that Sir Thomas Lipton did not use Shamrock II., already on this side, as a trial boat. Her capabilities against the

seems to be a crucial point. She may happen to be five minutes slower, and if not any faster, why, Shamrock III. is but a doubtful improvement. I cannot help thinking that one could with a good deal of safety venture the opinion that besides Reliance, the following, Columbia, Constitution, and Shamrock II. can beat Shamrock III. It would be an interesting spectacle to see a race between these five boats, and perhaps the Shamrock I. thrown in.
CANADIAN.

About T. Lipton.

About T. Lipton (may his tribe increase!)
Awoke one night from a deep dream of peace,
And saw an angel with a fountain pen
Scribbling upon a sheet of foolscap. Then,
Regaining his composure, Tom sat up
And asked the angelic one to have a cup
Of his best tea. The angel shook his head.
"I'm on the water wagon, now," he said.
About T. Lipton waved his hand. "I see,
but, by the way, what writest thou?" said he.
The heavenly vision answered, "Well, I write
Here on this little sheet, in black and white,
The man whose boat will get the needed place,
The winner in the coming yachting race."
The gallant Lipton brightened up. "Pray tell,"
He queried, "does the name begin with L?"
"I'm sorry," said his guest. "It is a shame,
But as things stand, I cannot write your name."
T. Lipton made reply, "Would I were it,
But put me down as one who never quit!"
The angel wrote and vanished. The next night,
He called on Tom again, but not to write.
Said he, "I have on this large handsome chart,
(A fine example of the engraver's art)
The names of some true sportsmen—just the best."
And lo, T. Lipton's name led all the rest!
—William F. Kirk in Milwaukee Sentinel.

Rifle Range and Gallery.

Rifle Shooting at Old Guard Fair.

The following press matter has been received by us:
During the month of September the Executive Fair Committee of the Old Guard fair, which will fill Madison Square Garden from the floor of its basement to the roof, throughout the week of Oct. 5 to 10, has planned to have "open house" every evening at the Old Guard armory, Broadway and Forty-ninth street, where the General Committee and all the sub-committees that are getting busy building the fair, can rendezvous. During the month of August the stay-at-homes have been meeting every Monday evening and devising many features for the fair, which will add to its attractions and swell the profits to form the nucleus of their Armory Building Fund.

The latest sub-committee appointed by Major S. Ellis Briggs, Chairman of the Executive Committee, and Commandant of the Old Guard, is the Rifle Range Committee. This important committee will be headed by Col. Leslie C. Bruce, of the Old Guard, who, more than any other one man, made possible the sending of an American rifle team, of which he was the captain, to Bisley, England, and defeated the picked sharpshooters of all competing civilized nations, and placed Uncle Sam in secure possession, probably for a long time to come, of the Palma trophy. Among Colonel Bruce's able colleagues is Lieut. Thos. H. Keller, who plays a valuable part in the triennial successes of the national shooting festival, which in 1904 will be held at Union Hill, N. J. The Rifle Range Committee, besides Colonel Bruce and Lieut. Keller, is composed of Capt. George E. Libbey, Capt. T. W. Timpson, Lieut. Fred W. Seybel, Mr. Fred T. Alder, Mr. James McNevin, Lieut. C. H. Rockwell, Capt. James C. Summers, Lieut. James W. Miller and Lieut. Lee R. Townsend, secretary of the committee.

The Indian Tournament.

ARNOLD'S PARK, Ia., Aug. 25.—The fifth annual tournament of Indians commenced this morning with sixty entries. The weather was cloudy and cool. The Tribe was represented by Chiefs Long Talk and squaw and daughter; Dago and squaw; Heap Talk and squaw; Wipe Stick, Bald Eagle, Kinnikinnic, Piasa and squaw, Spoon River and squaw and son; Bull Seal; All Aboard and squaw; Little Hatchet; Toboggan and squaw and family; No Smile; Quick Trigger and squaw; Hoot Mon and squaw; Back to the Woods and squaw and daughter; Follow Trail and High Temper.

The programme had eight 15 and four 20 target events each day, with \$100 to the 15 and \$15 added to the 20 target events. The traps were from two sets of traps fitted with traps. The traps were set facing the lake, to the northwest, about 30ft. above the water. There were \$94, divided \$7, \$15, \$10, \$9, \$8, \$7, \$6, \$5 and \$5 to the ten high guns.

Three cups will be awarded to highest averages for the four days as follows: First, 90 per cent. and over; second, 80 to 89 per cent.; third, to contestants below 80 per cent. All ties for cups will be shot off at 50 targets. Two shower sticks were donated by Chief All Aboard, and squaw All Aboard; one open to contestants who have squaws and one to contestants who have no squaws. Mr. Maurice Kauffman presented the Indians with an address watch fob. The Dickey Clay Manufacturing Company gave the tribe a fine gold medal. The above prizes will be shot off in special events on the third and fourth days. The Mallory brothers, from Parkersburg, W. Va., accompanied by their families, are attending the tournament and are doing some good shooting. They are welcome visitors. The Indians are more than pleased to have them in attendance, and will spare no pains to make their visit a pleasant one.

On Monday afternoon twenty-six men shot four 15 and two 20 target events. Bald Eagle was high with 96. J. F. Mallory and Wipe Stick were second with 94 out of the 100. In today's events Kinnikinnic was high with 190. F. E. Mallory, Little Hatchet and Wipe Stick were second with 188. Dago and Hughes were third with 187.

The weather prospects are good for to-morrow, and a number of new entries are expected.

Second Day, Aug. 26.

About 3 A. M. it commenced raining, and when squad No. 1 was called the rain was falling fast and furious. When event No. 1 had been finished, it was decided to postpone the shoot until after lunch. After waiting until 3 P. M. for the rain to cease, the shoot was postponed until to-morrow, when, the unfinished events in to-day's programme and the programme for to-morrow will be completed if the weather will permit.

The Indians held their annual meeting this afternoon, and the following business was transacted:

The annual meeting and pow-wow of the Indians was held this day at the above address, High Chief Long Talk (Marshall) presiding, and all officers present. The annual reports of officers were read and adopted. Resolutions of thanks to donors of special prizes were adopted, also to officers for services rendered, and to the management of Arnold's Park for courtesies extended during this meet. Former officers were indorsed and re-elected by acclamation, and the office of First Assistant High Chief was created. The officers for the following year, therefore, are: J. A. Marshall, (Chief Long Talk) High Chief; W. R. Crosby, (Chief Kinnikinnic), Vice-Chief; Frank C. Riehl, Chief Scribe; Jas. W. Budd, Chief of Wampum.

Standing committees were left unchanged, and John Burmister (Chief Back to the Woods) was added to the Tournament Committee. The recent demise of Mr. B. Le Roy Woodward, Chief of the Fid, was announced in a letter from his sister, together with one from the departed chief, which was written the day before he died. This and the memento of the Indians, as prepared by the Chief Scribe, were ordered spread upon the records and submitted to the press for publication, as follows:

16 South street, Campello, Mass., Aug. 8, 1903.

From A. Marshall, Chief Long Talk, and Fellow Chiefs: I regret exceedingly my inability to be present with you at our annual pow-wow, as I already have the Happy Hunting

Grounds in sight. I have had a long, suffering illness for about a year, but think it is about over.

While you are chasing the elusive bluerocks with your guns I shall be after the wily buck with my bow and arrow.

An affectionate farewell to you all, as well as to your squaws and papooses.

I trust you will have an enjoyable time at Spirit Lake, and some time or other we will all be together to line up in a squad of five again. Affectionately yours,

B. LE ROY WOODWARD,

Chief Dub the Fid.

The memento dedicated by the Indians to their departed fellow chieftains is subjoined:

Dark is the forest; all is still;

No more the magic wand,

Attuned to life from Nature's heart,

Obeys the master hand.

Again the Manitou has sent His summons to the Council of the Indians, and the sad-faced messenger from the Far East is here to announce that B. Le Roy Woodward, Chief Dub the Fid, has passed to the better, broader hunting grounds that lie beyond the shadow of the last sunset, in the infinite unknown.

Summoned in the prime of young manhood, when all the best of the hunt should lie before him, we find it hard to how to this decree. But in the short time that he abode with us in this council, and in the work of honorable competition and conquest, he fully demonstrated his title to the place accorded him by his fellow braves, as a fearless, faithful and untiring worker. And not less shall we honor his memory and lament his departure for those rare times when in lighter vein he beguiled the idle hours with sweetest melody in the art which earned him his tribal name.

Wherefore, in this hour of mutual sorrow, we dedicate this memento to his faithful service and true worth, and extend to those near and dear to him by the ties of home and kindred, the sympathy and condolence of the Indians, while over his grave the hand of love rears the fair flower of an undying faith.

Subscribed by the Indians, assembled in annual conclave, Lake Okoboji, Ia., Aug. 26, 1903.

A large number of applications for membership in the tribe being presented, it was decided to slightly increase the membership list, and five new chiefs were chosen by vote from the list of all candidates submitted.

The new members, with their tribal names, by which they will be known in council, are as follows: F. E. Mallory, Parkersburg, W. Va., Chief Tell 'Em How; J. F. Mallory, Parkersburg, W. Va., Chief Hole Digger; S. T. Mallory, Parkersburg, W. Va., Chief Life Saver; W. H. Heer, Concordia, Kans., Chief Three Scalps; C. B. Adams, Rockwell City, Ia., Chief Drink Water.

Meeting adjourned.

Tom A. Marshall, High Chief.

Frank C. Riehl, Chief Scribe.

HAWKEYE.

Derry Tournament.

DERRY, Pa., Aug. 29.—Appended find the scores of the shoot at Derry, Pa., Aug. 25 and 26. Thirty-one shooters participated, thirteen shooting through the programme.

The trade was represented by Frank Lawrence, E. D. Fulford, Chas. G. Grubb. Messrs Frank Lawrence and Chas. Grubb hustled squads.

On the first day it rained almost continuously, and there were frequent severe storms, accompanied by thunder and lightning. The wind blew in the faces of the shooters, and on one occasion blew the targets so high they sailed back over the firing line.

A sad accident occurred during the storm. Lightning struck a small house near the shooting grounds, killing a young man and wrecking the house. The scores follow:

	Aug. 25.	Aug. 26.	Total	Total

Cincinnati Gun Club.

CINCINNATI, O., Aug. 22.—The Cincinnati Gun Club gathered its best scatter gun artists together last Friday and journeyed to Dayton, O., with the determination of regaining their reputation, which they lost recently at Mechanicsburg, and also to gain possession of the Phellis trophy, the ownership of which gives the right to claim the six-man team championship of the State.

The race was shot over a magautrap, the targets being thrown about 55yds.

The day was an ideal one for the sport.

A more exciting race could hardly have been made, as it was nip and tuck until the last 15 targets, when the pace got too warm for one of the Daytonians and he "blew up."

When Gambell and Sunderbruch went to the score for the last time against Craig and Cairn, the home team was one target ahead. Gambell took a "smile" or two, Sundry gritted his teeth and said, "Now, 'Old Scout,' get at 'em, and break 'em all." Just to show he could do it, Cincy's superintendent got his 25, Sundry 23, Craig 24 and Cairn 16, giving Cincy the race by 7 targets. An eight-man team race followed. Results:

Dayton Team—Craig 47, Jack 46, Ermel 44, Miller 41, Raymond 40, Cain 39; total 257.

Cincinnati Team—Gambell 46, Medico 46, Sunderbruch 45, Grau 43, Don Minto 43, Osterfeld 41; total 264.

Eight-man team match:

Dayton Team—Jack 48, Raymond 48, Ermel 47, Craig 45, Cain 43, Ryan 43, Spangler 41, Tippy 28; total 343.

Cincinnati Team—Gambell 46, Medico 45, Maynard 45, Grau 44, Sunderbruch 42, Don Minto 42, Barker 41, Osterfeld 41; total 346.

Cincinnati Gun Club cash prize event, 50 targets, distance handicap, resulted as follows: Maynard, 17yds., 46; Sunderbruch, 19yds., 45; Gambell, 20yds., 44; Barker, 19yds., 41; Nye, 16yds., 40; Medico, 19yds., 38; J. B., 17yds., 38; Falk, 17yds., 36; Randall, 20yds., 35; Linn, 18yds., 34; Jack, 16yds., 33; Norris, 15yds., 24; Colonel, 15yds., 21; Hobart, 15yds., 16.

Sparta Gun Club.

SPARTA, Mo., Aug. 27.—Only four of the regulars faced the trap to-day. About one-third of our members are traveling men and are seldom present. A new trap and a strong wind blowing across the traps made good scores impossible.

The scores in the 15-target event follow:

Lee, 13.....1100100100010—6 Farmer, 8.....010100000101011—6 Johns, 12.....11100100101101—9 Hornbeak, 14.....01011101101110—10

Hornbeak won merchandise prize, and was high man on trophy.

The committee offered as a prize one year's subscription to FOREST AND STREAM to high gun, 25 targets per man. Scores follow: Downs (12) 13, Rains (12) 12, Barnes (8) 8, Bird (12) 14, Farmer (12) 5, Johns (12) 13, Dye (12) 16, Wall (10) 9, Lee (14) 12, Baker (12) 14, Morris (12) 9, Hornbeak (14) 18. Hornbeak won on 18.

T. E. HORNBEAK.

IN NEW JERSEY.

North River Gun Club.

Edgewater, N. J., Aug. 29.—We were to have had the Wanderers with us to-day, but the hard rain kept them away. Event 6 was for a solid silver cup. It resulted in a tie between Glover, Eickhoff and Morrison. Event 7 was a shoot-off of the tie, which resulted in a tie between Eickhoff and Glover. This tie will be shot off at some future date. The handicaps apply to the cup event only. The scores:

Events:	1	2	3	4	5	6	7	8	9
Targets:	15	20	10	15	10	25	25	15	10
Eickhoff, 3	12	16	4	11	9	19	20	7	10

Truax, 2	4	9	6	19	...	10	...
Marshall	5

J. R. MERRILL, Sec'y.

Hell Gate Gun Club.

Hackensack River Bridge, N. J., Aug. 25.—The shoot of the Hell Gate Gun Club for August was held at Outwater's grounds, Hackensack River Bridge. Mr. H. Kracke, a guest, was the only one to kill straight in the club event at 10 birds. Twenty-six contestants participated in the main event. The scores:

L. H. Schorty, 30.....12111122*2—9	Col J. H. Voss, 30.....1110121122—9
Van Valkenburg, Sr., 28.....12102*111—8	J. Dannefeller, 28.....21222020012—7

Pattensburg Gun Club.

Pattensburg, N. J., Aug. 29.—The regular monthly shoot of the Pattensburg Gun Club was held to-day. Stamets and Bonnell tied for the medal, and in the shoot-off Bonnell broke his first target and won the first medal, and Stamets missed his first target and won the second medal. A very pleasant time was enjoyed, but the shooting was difficult on account of the strong east wind. The scores were as follows:

A. E. Holbrook.....01101110111101101001001—16
H. Gans.....11011111110100111110011—19
W. S. Bowly.....0111110*11010000101010—13

Dimmig.....1110001011100110101010110—14
Barker.....1110011110111111101011011—19

Shoot-off: Bonnell 1, Stamets 0.

Arkadelphia Shoot.

ARKADELPHIA, Ark., Aug. 22.—The liberal programme of the Arkadelphia Gun Club for their first annual shoot, Aug. 20 and 21, did not draw a very large attendance, but notwithstanding that the shoot was quite a success, and those present were well repaid for coming. The chances to win expenses were excellent, for with the liberal amount of added money one always received more than his entrance money when sharing in a division of the purse, even though it was fourth or fifth money. Thus even the poorer shot won some money and is thereby encouraged to try it again.

Why the attendance was not larger is hard to say, for with \$212.50 added money and a fine trophy to compete for, the club should have received a generous patronage, and thereby encouraged to greater effort next time.

In addition to the generous amount of cash, everything was in first-class shape, and the events were rapidly disposed of. The shooting was done over expert traps, arranged on the Sergeant system. The shooters faced east, and there was practically a sky background, so little fault could be found in this respect. The weather throughout was clear and pleasant, and not too warm. The first day there was quite a wind, which caused the contestants some annoyance, as is shown by the scores; but on the second day the conditions were almost perfect.

W. B. Powell, of English, was high on the first day with 163 broken out of 185, Wright and Camden being second with 158.

On the second day, Turner, Hubby and F. M. Faurote, of Texas, two experts, put in an appearance, and they were in the van, with 171 out of 185. In the amateur class Farmer John M. Pemberton, of Little Rock, was high, with 164, closely followed by W. B. Powell, with 163. W. B. Powell won high average for the two days, \$10 in cash, with 326 out of 390.

The Peters challenge trophy, a new emblem donated by the Peters Cartridge Company, for the occasion, was contested for on the first day. This was a handicap event, and was won by Gibson Thibault, of Little Rock, with 44 out of 50 from the 18yd. mark. C. E. Pierce, of Camden, was second, with 43. This was the inaugural contest for the emblem, a beautiful gold watch charm; but the holder is subject to challenge and must defend the same every sixty days. Already there are a number of aspirants, and Mr. Thibault will be kept busy defending the emblem.

The success of the shoot is due to the efforts of Messrs. L. E. Knott, Ed McCorkle, Dr. E. K. Williams, H. W. Allen and D. L. Graves.

There were three Powells present, W. B., of English; S. M., of Little Rock, and H. S., of Camden; they were not related.

There were three M.D.s. present, and all answered to the name of Williams: Dr. H. E., of Pine Bluff; Dr. A. U., of Hot Springs, and Dr. E. K., of Arkadelphia; these, too, have no family connections, to the best of their knowledge.

First Day, Aug. 20.

A SENTRY'S BLANK.

A NEW LONDON press dispatch reports that Sergeant L. Bryson, of the Second Company, Coast Artillery, stationed at Fort H. G. Wright, Fisher's Island, was shot and instantly killed last Saturday by a sentry. The explanation given out is that the sergeant and some companions were cutting up pranks in the rear of the mess house while dinner was being served, and an officer ordered the sentry, Private Price, to fire a blank cartridge at the sky-markers. "Price slipped a loaded shell into his piece and fired at Bryson. The ball passed through Bryson's body, killing him instantly. While on guard, the soldiers carry five rounds of blank ammunition and five of loaded cartridges. It is claimed that Price got a loaded shell in mistake for a blank. He is under arrest, pending an investigation."

This is an extraordinary explanation. Is the public to understand that it is a practice in the United States Army to fire blank cartridges at human beings? A more ingenious system to insure the inevitable did-not-know-it-as-loaded style of manslaughter could not be contrived in the army or out of it. Give a man a supply of blank and loaded cartridges and order him to shoot a blank at a man, and sooner or later, seldom or frequently, as pure luck may fall out, he is certain to do just such slaughter as this of Sergeant Bryson. That man does not live whom any one of us would trust to shoot blanks at us if he had also in his equipment a stock of shells loaded with bullets.

Of all men in the world soldiers, whose trade it is to handle weapons of death, should be taught always and under all conditions to remember that the gun is a deadly weapon and must without any exception whatever be handled as such. Of all men in the world the soldier should be the last one to fire a gun at a human being unless the intention be to wound or kill. If the Fort H. G. Wright blank cartridge firing at a skylarking sergeant is in accordance with the regular procedure in such cases made and provided, the regulations cannot be too speedily amended. If, as is more probable, the order to discharge a blank cartridge was simply a manifestation of criminal foolishness on the part of the officer who gave the command, that individual, too, should be put under arrest along with the agent who executed the order.

THE ORANGE COUNTY LAW.

The last New York Legislature enacted two special laws relating to Orange county. Section 26, amended by Chap. 520 of the session laws, provides as to Orange county grouse:

Sec. 26. Grouse shall not be taken . . . in the county of Orange from December first to October fifteenth, both inclusive.

And Section 27b, added by Chap. 475 of the session laws, reads:

Sec. 27b. The close season for grouse, woodcock and quail in the county of Orange shall be from December sixteenth to October fifteenth, both inclusive.

As a natural result of these conflicting enactments the gun clubs of Orange county have resolved themselves into debating societies to determine where they may lawfully go shooting.

While the law at first glance appears to be complicated, it is comparatively clear and simple when examined and construed by the rules which govern in such cases; and we give the construction as adopted by the *Game Laws in Brief*.

First, as to woodcock: Sec. 27b holds, and the season is as stated therein.

As to grouse: Sec. 26 prevails over Sec. 27b; because Chap. 520 which amended it was a later enactment than Chap. 475, which added Sec. 27b. The grouse season for Orange county is therefore the season specified in Sec. 26. The quail season is the one about which there is most question in Orange county; but there is no room for uncertainty as to it. At the time when Sec. 27b was enacted, the quail close season for the State, as prescribed by Sec. 22, was December 16 to October 31. Subsequently to the enactment of Sec. 27b, the general quail law (Sec. 22) was amended, to make the close season December 1 to October 31. But this later amendment of the general law Sec. 22 did not affect the special Orange county law Sec. 27b. Section 22 might have been changed accordingly without affecting Sec. 27b. The purpose of amending Sec. 27b was, as to quail, to provide a special

Orange county season differing from the general season given in Sec. 22. The general law in Sec. 22 did not apply to Orange county previously to the amendment of Sec. 22, no more could it apply after its amendment.

The close season for quail in Orange county then is from December 16 to October 15, both inclusive; and the open season is from October 16 to December 15, both inclusive.

We understand that the protective authorities have given out conflicting opinions on the Orange county seasons. It is clear, however, in view of the constructions which must be given to these sections, that no close seasons can be enforced other than such as we have designated.

THE AMERICA'S CUP.

THE outcome of the recently completed races for the America's Cup was to us a foregone conclusion. After studying the performances of both the challenger and the defender closely and dealing with the situation from every point of view, we did not see how Reliance could help but win, not only the series but every race. Early in the year we ventured the statement that Constitution could successfully defend the Cup, and as subsequent events have proven she could have done so handily, and in some instances when the weather conditions were to her liking she would have beaten Shamrock III. worse than Reliance did. However, we are not sorry that Reliance was built; not because she was necessary for the safe defense of the Cup, but because it is interesting to know that a scow could be produced in the largest racing sloop class that was a fast all around boat and a consistent performer in all weathers and under all conditions. As the next challenger and defender will be designed under the new rule which it is hoped will produce a more normal and wholesome boat, it was educational if nothing more to know before making a radical departure that a more extreme boat in every particular than Constitution could be built and made successful. The indifferent showing that Independence made two years ago rather created the impression that boats of the scow type were not practical in the ninety foot class. Reliance's success upsets this theory and demonstrates again the Herreshoffs' wonderful ability both as naval architects and engineers. Nevertheless, the design and form of the hull is becoming less of a factor, and the boat that has the great advantage is the one with the best sails and the most competent skipper.

In Shamrock III. Mr. Fife turned out a remarkably beautiful boat of a normal type, compared with Reliance, that at times displayed unusual speed. To our mind Mr. Fife made the mistake of going to extreme refinement in form and taking a comparatively small amount of sail. Had he turned out a little more extreme and powerful boat than Shamrock III., taken less waterline length and given her the same amount of sail that Reliance carried, the result of the races might have been different; they certainly would have been much closer. It is the old story that the boat that carries the extra sail can invariably afford to pay for it, and such was the case in the last races, for it was Reliance's extra sail that saved the day (together with Barr's superior handling), and she could have paid a much heavier penalty for it than she did and still have won.

Much of Reliance's success was due to the discipline that prevailed on board and to the excellent way she was managed. To one who has been aboard the challenger and defender the difference was, to say the least, very marked, and a comparison showed that the superiority lay in favor of the Reliance. Mr. C. Oliver Iselin, the managing owner of Reliance, is well known as a great disciplinarian and a splendid organizer. From the time he first interested himself in the defense of the Cup his efforts have met with pronounced success. He has surrounded himself with well-known amateurs, and the best procurable professionals. Captain Barr caught Mr. Iselin's spirit early in the game, and this, added to his knowledge and ability as a yacht skipper, has made him so superior in his line that to-day he is in a class by himself, without a peer. He in turn surrounds himself with the best possible talent. His mate, Christensen, has been with him for years, and has adapted himself to his requirements and needs in every way. When it came to the selection of a crew, men were picked from the smaller racing boats where quickness and intelligence is more of a factor than in the larger ones. Many of the racing boats on Long

Island Sound lost the crews that had been with them several seasons because the pay on Reliance made a position there more attractive to them, and after having sailed on a Cup defender it is possible for them to secure a better berth the next season. The men on Reliance were almost without exception Scandinavians and Norwegians, men not as well educated or with the natural intelligence of the Englishmen on Shamrock III., yet under the training they received they turned out to be a better and more efficient racing crew in every particular. The men on Reliance were worked very hard, just as the men on Columbia and Constitution were, yet they were given sufficient recreation, excellent food, and Dr. Monahan not only looked after the comfort and sanitary conditions of their living quarters, but each man came under his watchful eye and care, and they were kept in the best physical condition. Such are the details that are part and parcel of the management and the running of the successful defender. On Shamrock III. the men had much the same attention and care, but the system and discipline seemed lacking, and the men did not work with the same snap and vim as those on the defender. Barr received a salary of eight thousand dollars for his season's work, two thousand dollars more for winning out in the trial races against Columbia and Constitution, and two thousand dollars more for successfully defending the Cup. The owners dealt very liberally with the crew, and they received a bonus in addition to their large pay.

All those who came in contact with Mr. Fife during his stay here were greatly drawn toward him, and his quiet, unassuming manner won for him a host of admirers and friends. Many would have liked to have seen Shamrock III. win out on his account rather more than on Sir Thomas Lipton's. Mr. Fife proved himself a fine loser, and he took defeat like the thorough sportsman that he is.

We hope no more challenges for the America's Cup will be forthcoming for at least three years, for the racing between these big boats is ruinous to our yachting in general, but now is the time to challenge, if it is desired to strike home, for many reasons. The designer of the defender and challenger will begin on even terms, for both the boats will have to be designed under a new and untried rule. Even Mr. Herreshoff himself has turned out but one large boat under it—the schooner Ingomar. The rule is supposed to produce a compact boat of a normal type, and if anything the English designers have been more successful at designing boats of this description than our own. A new boat would have to be built, as Reliance would be so penalized under the new rule that she would not be a practical defender, so both sides would be without trial boats, for what we have just stated would apply to Shamrock III. as well, only in not so marked degree.

The courses for the Cup matches were excellently patrolled by Captain Thomas D. Walker's boats, and the yachts have never had less interference from the attending fleet than this year. The work was difficult, particularly on the day of the triangular race, but the revenue cutters and the yachts in charge of revenue officers had the situation well in hand all through the series.

The Regatta Committee of the New York Y. C., Messrs. S. Nicholson Kane, Newbury D. Lawton, and E. D. Wales, deserve great credit for the able way in which they handled and managed not only the final races for the America's Cup, but all of the events that the club has given this season. Their work has been very arduous, and all through the summer their attention to their duties has been untiring and the responsibility very great. The New York Y. C. is to be congratulated on being fortunate enough to secure the services of three such able and capable men who are willing to devote all their time and energy to making the racing—the life of the sport—and the club a success.

Of the 34,989,000 acres of forests in Germany, 17,443,188 acres, or nearly one-half, are under public control, belonging to the States and municipalities. All this public forest, as well as that held by private owners, is maintained in a high state of scientific cultivation. The systematic economy practiced by the Continental people in their use of the products of the woods is a revelation to Americans traveling in Europe. Every part of the felled tree is utilized; even the smallest branches and twigs, which in America we burn to get rid of, are in Germany bundled for fire wood.

The Sportsman Tourist.

Thoreau.

A Little Study of a Great Man.

It is difficult to characterize Thoreau; it is difficult to understand what his chief motive in life was; but he seems to have had in mind to give to the world a practical illustration of the doctrine of plain living and high thinking. For this purpose he retired to the bank of Walden Pond, near Concord, where he built a small house with his own hands, and in which he lived for two years at a minimum of expense. In his book, "Walden," he gives details of his experiment in living a life of simplicity. The entire cost of his house was \$28.12½; he specifies the items of his building expenses to the cost of the chalk he used—one cent. Of his house he said: "I intend to build me a house which will surpass any on the main street of Concord, in grandeur and luxury, as soon as it pleases me as much and will cost me no more than my present one." His expense for provisions, exclusive of vegetables, which he raised in his garden, for a period of eight months, from July to March, were \$8.74. "Yes," he says, "I did eat \$8.74, all told; but I should not thus unblushingly publish my guilt if I did not know that most of my readers were equally guilty with myself, and that their deeds would look no better in print."

What did he do there by Walden Pond? For the most part he read, he wrote, he mused, he walked about, he worked in his garden, he talked with his friends, he cultivated an intimacy with the fish in the pond and the squirrels in the woods. It is said that he could take the fish out of the water in his hands, while the squirrels came down from the trees and climbed over his head and shoulders. He was one of nature's noble men. He was a mathematician; he was a scholar; he read Homer daily in the Greek for his own recreation; in the old days, when abolitionists were few, he was the enemy of the slave power, and his "Plea for Captain John Brown," delivered in the public hall in Concord, was one of the most powerful and eloquent utterances at a time when few had the courage to speak out. He was a man of the woods, and he was a man of books. To hold intercourse with Thoreau, Hawthorne said, was "like hearing the wind among the boughs of a forest tree." He died comparatively young in the year 1862.

President Jordan, of Leland Stanford University, characterizes Thoreau as the chief prophet of the "Order of Saunterers." Thoreau described himself as belonging to the "Church of the Sunday Walkers." He had an intense love of nature, and of home. Concord was everything to him. "Nothing can be hoped of you," he said, "if this bit of world under your feet is not sweeter to you than any other in this world—in any world." The admirers of Thoreau form an order of themselves. They resent all criticism of his life or his words. They are impatient of all analysis of his methods or of his motives.

President Jordan says that the most illiterate man he had ever known who had ever heard of Thoreau was an Irishman, Barney Mullins, of northern Wisconsin, with whom he had once ridden on an ox sled through the deep snows of that region. In the course of conversation Barney stated that he had lived at one time in Concord, Massachusetts, before coming to Wisconsin. "I asked him," says Dr. Jordan, "if he had happened to know a man there by the name of Henry Thoreau. He at once grew enthusiastic, and he said, among other things: 'Mr. Thoreau was a land surveyor in Concord. I knew him well. He had a way of his own, and he didn't care much about money; but if there ever was a gentleman alive, he was one.' And so great was his affection for Thoreau, though it was many years since he had lived in Concord, that he urged the Doctor to accompany him to his house and spend the night with him. 'He hadn't much of a room to offer me,' says he, 'but there was always a place in his house for a friend of Mr. Thoreau.'"

"Here is a test for you," adds President Jordan. "Thoreau says: 'I long ago lost a hound, a bay horse, and a turtle dove, and am still on the trail. Many are the travelers I have spoken to regarding them, describing their tracks, and what calls they answered to. I have met one or two who have heard the hound and the tramp of the horse, and even seen the dove disappear behind the cloud, and they seemed as anxious to recover them as if they had lost them themselves.'"

"Now if any of you, in your dreams," says Dr. Jordan, "have heard the horse, or seen the sunshine on the dove's wings, you may join in the search. If not, you may close the book, for Thoreau has not written for you."

T. J. CHAPMAN.

Life in the Rockies.

FROM earliest boyhood the inherited love of the woods and undisturbed nature reigned in me supreme and choked out all ambitions for trade or profession, leaving only a longing desire to flee from civilization, from the burdens, disappointments and hypocrisy of society, to be alone in the corridors of nature's great domain, which had not been defaced by the hand of man, the study of whose inhabitants makes life a joy. From the day when the house dog treed an animal, we knew not what, a few rods from the house, on a sapling, and we boys, by an hour or more of hard work with an ax, felled it, and after great effort killed what proved to be an opossum, up to the time of manhood, the passion grew.

Still fighting against what seemed, when soberly looking into the future, an aimless desire, in a half-hearted way I applied myself to books, until able to secure a position as teacher of a country school, and worried through two terms with success which would have gratified one ambitious of professional work. The last term had nearly expired: I was wending my way one morning toward the structure where the foundations for greatness are laid, one of those calm winter mornings when a few snowflakes were lazily falling from the dark clouds, when I stopped to drink in the beauty of the snow-covered landscape.

I heard a faint sound floating down from a wooded

ridge, so faint and yet so familiar, and dear to my heart: I at once recognized the familiar voice of a foxhound in pursuit of a fox. Such a morning for a fox chase! Warm and pleasant with just enough snow for good tracking, and not a breath of wind blowing to carry away the music.

I stood enraptured and oblivious to my surroundings, then looked over at the schoolhouse on the hill, and knew that I must pull myself inside its walls and allow the sweet music, wooded landscape and pure air to be replaced by the buzz of restless children, pencil-marked walls and chalk dust. It was then and there that my long unsettled mind was brought to a sudden and decisive point. I would finish my present obligations to the young and rising generation, and to those who had employed me, then I would break the bonds which had held me, and go, I knew not where; anywhere to get away from the turmoil and strife of mankind.

Accordingly, I set about deciding on a location. To my mind, from boyhood, the Rocky Mountains were my idea of a wild and rugged place, and there my mind turned instinctively. Having heard of Fort Collins, Colorado, being at the foot of the Rockies, I pictured it as a border town and a proper place to make my first stop. In due time I landed there, and found a thickly settled and highly cultivated community, entirely different from that I was looking for. Idleness being one of the hardships to which I was not accustomed, I set out to find work on a farm until I could get my bearings for another move, inquiring in the meantime for any person who might give me information concerning the farthest settlements in the mountains and the facilities for getting there. Securing employment on a farm four miles from town, I worked a week amid unpleasant surroundings, when I went to town to get my mail and look around. Having heard of a ranchman, hunter, trapper and guide by the name of Luke Wheeler, whose home was far up in the mountains, where big game abounded in such numbers as I had never even hoped to see, and who was staying temporarily at Fort Collins, I proceeded to find him, just to see what a real, live frontiersman looked like. Having found his abiding place, I proceeded out to the stable, where he was taking care of a number of horses which he had brought down from his mountain ranch. He met me at the stable door, a giant in stature, over six feet tall, powerful, raw-boned, with heavy black beard and a voice like thunder. I at once began to offer my apologies and excuses for calling on him, hardly knowing myself why I had called; only to see what he looked like. Like a true frontiersman, he received me with hospitality, gave me a brief description of the wild mountain country where he lived, and proposed, unsolicited, that if I was inclined to go to that locality, he would give me employment for the summer; that he was going to start for the ranch in a couple of weeks with two wagons, and that my transportation would be free if I cared to engage myself to him. It seemed too good to be true; the very opportunity I was looking for. After learning from him that I should provide myself with bedding if I was going to that country, as every person was expected to furnish their own bed, and getting all needed information, I left him and just walked on air for days after that.

To say that I was happy would put it very mild. A mint of money would not have made me happier, and long and fondly will Luke be remembered for the generous way in which he took hold of the "tenderfoot."

Of course the next important matter for me after getting my blankets was what kind of a gun to get. I decided finally on a .40-82 Winchester, and once in possession of that and a supply of ammunition, I felt rich, no matter what else might be lacking.

The eventful morning came for starting. Luke and his wife, with the lighter loaded two-horse wagon, took the lead, and Bert Reed, Bob Wheeler and myself clung to the other wagon, in which were four veritable broncos, which, not having worked any all winter, succeeded in making things "wild and woolly" at the start; which was right to my taste, for I wanted to see everything as it was. Bob Wheeler was a younger brother of Luke's, who had a ranch joining Luke's, and assisted him in his hunting and guiding expeditions. Bert Reed was an old-timer of that section of the Rockies, and had also spent the winter in Fort Collins, and was going back to the mountains, and subsequently became my trusted companion and partner in later years, in some of my most interesting experiences in the West. I frankly told the boys in the start that I was a sure-enough "tenderfoot" and wanted to learn the ways of the West, and asked them to give me such instructions from time to time as they might see opportunity and need. This they kindly did, showing me how to cinch up a saddle, mount a horse properly, bake biscuit and all the many necessary requirements of a Westerner. Bert being an expert four-horse driver, handled the ribbons over the four broncos, and after a few wild breaks and mix-ups, we got them untangled and strung out, and were off for the mountains.

The ranch was 140 miles from Fort Collins, and the trip looked long to me, never having been used to long overland trips. The first night we rolled up in our blankets under the wagons, and the wind blew a hurricane all night. The next evening we stopped at the ranch of a friend of Luke's, where we were to stop over for a day or two to rest. The trout fishing was fine, and we enjoyed the stop and caught some fine strings of the speckled beauties. The "tenderfoot" sprained his ankle climbing among the rocks, which stopped all walking for a couple of days, but it was not until the evening of the last day of our stay at camp, so it did not cause any inconvenience, only the loss of a night's sleep. The last night there we left a pan full of trout, cleaned, ready for breakfast, sitting near the tent door, on the bank of the stream, and in the morning there wasn't a trout in the pan: a mink had been to breakfast ahead of us.

On the evening of the third day's travel we reached the "Sheep Grove," a little swampy place covered with a growth of alders and willows, out on the Laramie plains, in a blinding snowstorm. This was my first rough experience; at least I thought it was rough. Of course the first work was to build a fire, and then to put up a tent to protect Mrs. Wheeler and her little

baby. Anyone who has camped out in a snowstorm knows the rest of the programme; any who have not must try it to fully appreciate it. The next morning everything was snowed up so that moving our loaded wagons was not to be thought of, and there was only one thing to do: Luke took his wife and the horses and went back about four miles where there was a "road ranch" (which is a public stopping place along the road), and left us to take care of the outfit until the snow would go off. It was a very uninviting place to "put up." We could barely find enough wood, and of a very poor quality at that, to do our cooking, and the remainder of the time we kept warm the best way we could. It was there in the sheep grove, in the midst of a snowstorm, with a very poor fire, that I was informed that every fellow had to take his turn baking biscuit in the Dutch oven.

I had never baked a biscuit, and had not the remotest idea how it was done, but a protest would not go; so I "took my medicine," but when the biscuit were baked, or rather dried hard, then it was that the other fellows had to "take their medicine"; there was no alternative; it was eat them or go hungry. At night we could hear the coyotes howl, which was the first greeting I had of wild life. We wore away three of the longest days that it was ever my lot to see, and with them the snow was wearing away; at last we were gladdened by seeing Luke come to release us from our prison, and we were soon on our way, all the happier for the discomfort. When within fifteen miles of the ranch I saw my first antelope. Oh, how they could run, and how I wished to try my new gun on them. When within seven miles of our home we stopped at a large stock ranch for dinner, where our whole outfit was fed with the hospitality prevalent among frontier ranchmen. With much interest I wandered around among the outbuildings and saw hanging everywhere some evidence of big game in the way of old deer, elk or antelope horns and hides. I felt that at last I had reached the ideal place, the place I had thought and dreamed of and longed for from boyhood. I could hardly stay indoors long enough to eat; the air was so pure and bracing, the atmosphere so clear and everything so bright.

About four o'clock in the evening we rounded the curve, which brought us in full view of our destination, when Bob let forth one of his Comanche yells, which was no doubt familiar to any living creature which may have been in hearing. The buildings were all little one-story log cabins, which was the only kind of buildings to be found in that locality. I dumped my belongings into the bunk-house, which was a little 10x12 cabin, with the ground for a floor, and bunks made of poles fastened up in the corners. The location was a small park called Big Creek Park, six miles long by one mile wide, in the midst of the rugged Rockies, hundreds of miles from any settlements in most directions; a place too picturesque and beautiful to describe, within ten miles of where snow lies all summer and at an altitude of 8,200 feet above sea level. I felt just as I imagine a young duck would feel which had never been in sight of water, and which was suddenly turned loose to abundance of water; I just reveled in my surroundings.

The snow falls there to a depth which drives all big game to other localities in winter, and we had as yet no opportunity to learn whether it had come in, but I could not wait to find out; I was up next morning and out in the woods before it was clear daylight, to see if anything might be in sight. In the woods, just back of the house, I found old deer trails beaten solid with their travel, and many tracks of the year before were visible, but no fresh tracks. I was back in time for breakfast, and was ready to begin work. During the entire day I could see a fine bunch of antelope feeding on the hillside, less than a mile away, and I plotted their destruction.

The next morning I was up before daylight, took my gun and determined to go over and hide among some rocks near where they had been feeding and surprise them when daylight came. When I got half way over, while going through the meadow, I suddenly came to Big Creek, a good-sized stream and much swollen by the melting snows in the mountains, so that I could not cross over. I had not figured on any such obstacle in my way, and felt sort of "up a stump." In the darkness I could see the dim outlines of some of our horses nearby and soon found one which I knew to be gentle. I took off my suspenders and made a halter, and was soon mounted and agoing merrily over the stream. The first streak of dawn found me safely hid near the favorite feeding grounds of the antelope. When the light of day revealed the surroundings there were no antelope in sight. Not having time to wait, I crept over to another rocky ledge, which overlooked a draw or swale of low ground, where the green grass made a tempting bait for game. There I saw, about 200 yards away, a fine bunch of antelope, all unconscious of danger, if a tenderfoot could be termed dangerous. There was no way of getting nearer, and I ventured a shot, but they all got away with whole hides.

A few evenings after that Luke was going up to the other end of the park on horseback, where there had been no settlements, to try for a deer, and he took my gun to initiate it. When he came back he had a fine deer lashed on behind his saddle.

Bert and Bob purposed spending a few weeks trapping for beaver, and soon had their traps strung out for several miles up the creek. One morning we found several inches of snow on the ground and I gladly accepted an invitation to go with them to visit their traps. They went on horseback, and as I had neither horse nor saddle, Luke allowed me to take one of his horses. When about two miles from the ranch, we crossed the trail of a big bull elk which had passed less than half an hour before, where it went through the snow-covered willows. It made a path through the willows like a "steer in a cornfield," and the tenderfoot's eyes bulged out to see such huge tracks made by a wild animal. I was fairly wild to get out with my gun and kill something, but as I was employed as a ranch laborer, and my employer was an experienced hunter and could easily keep himself supplied with meat, my opportunities for hunting were limited; but since

I had at least gotten where I wanted, I was content to "say nothing and saw wood."

It was still early in the season for much game to be around. Our meat was running low, and a neighbor, Mr. Burkett, from twenty miles distant, came to Luke's on some business, and wanted some wild meat to take home with him. They had spent the whole day hunting, and got no meat. It was a cold and chilly evening; the men were in the house lingering over their supper while I had gone to the bunk-house. I happened to look up in a pasture about 300 yards from the house and there saw six bull elk coming down toward the house. I gave the alarm, and let Bob take my gun, as he had none there, and away they went. By that time they had turned, and were going back the other way, and Luke took a run of a half mile up a steep mountain side to head them off and drive them back to the other fellows, which he succeeded in doing. They all began shooting at long range, and Luke finally landed a shot in the hind quarters of one as it was going away from him, and it fell. After the band had disappeared we all came together. Luke's gun was empty and he was out of ammunition. Bob gave him my gun, and he and Mr. Burkett went after the band, while Bob and I went to take care of the one which was down; it was not killed, but was making desperate efforts to get up. Of course we had nothing to shoot with except our knives. I said I thought I could get on its head while Bob would cut its throat. I got on its head and grabbed it firmly by the horns, which were then in the velvet, and Bob commenced operations. Suddenly I found myself flying through the air and lit about twenty feet below, as it was on a steep little bluff. I looked back and the bull was on its feet and coming right toward me. I "scooted" to one side and it went on past, for it was not after me; it was only trying to get away.

It went directly toward the house, about 150 yards, and lay down among the willows. We found it and repeated our tactics, and that time succeeded in killing it, not more than 150 yards from the house.

Luke and Burkett shot away the last of their ammunition at the band and wounded one so badly they could almost catch it, but had to leave it and come home. The next morning I went after it and found it dead but still warm, evidently having been dead but a few minutes, and the meat was all right and I dressed it, and we packed it home that afternoon.

My opportunities for hunting that season were limited, but I managed to get out occasionally and succeeded in getting several fair shots at deer, but could not kill anything. I had never been used to the big guns, and nearly became disgusted with my luck. The worst disappointments were when Luke would send me out to get meat, and I would come home empty, which I always did, for I was envious of a reputation as a successful hunter. A ditch was being surveyed up in the mountains above Luke's by a stock ranch company, in the latter part of the summer, in which Luke was interested; they were at work about three miles from the ranch, and Luke instructed me one morning to take a saddle horse and go up and help with the surveying, and to take along my rifle in the hope of getting some meat, as we were out of meat. When half way up I saw an antelope away up on a hill. I left the horse and slipped up through a thicket of jack-pines and got within 100 yards of it. I shot at it, with very little hopes of getting it, but was surprised to see it rear up, make a few plunges and fall, rolling several rods down the hill toward me. I went through the intervening thicket of quaking asp like a scared wolf, and found my antelope still and dead, with a shot through its heart. I dressed it and hid it in the bushes and went on to work; going home in the evening with the antelope tied on the horse behind the saddle, feeling much uplifted.

EMERSON CARNEY.
[TO BE CONTINUED.]

Lost on the Staked Plains.

A WRITER in a late number of Frank Leslie's Monthly gives an account of a scout, as he calls him (he was really an enlisted man that was being used as a courier), who was lost "in the far Northwest"; the exact locality is not given, but it was probably up in the northwestern part of Montana, just south of the Missouri River.

The man, mounted on a bronco, had started from some post there to carry a dispatch to an outpost. The story is all right, except the bronco part of it, he was not likely to have a bronco but a large American horse that would have more horse sense and use it in an hour than a bronco would in a life time.

The bronco was tried and found to be worthless as a cavalry horse thirty years ago, after our regiment, the Fourth Cavalry, had killed up about 2,000 of him. He is not heavy nor strong enough to carry what a cavalry horse has to carry, and has hardly sense enough to learn the drill. It may seem curious, but a good cavalry horse often knows more about the drill and trumpet calls than his rider does.

This man had started early in the spring, "when the midday sun thaws the surface of the snow, and a light frost afterward hardens the surface of the ice to a glaze that had crushed the snow over the trail, and the scout had to keep a sharp lookout so as not to lose the trail altogether." But he did lose it, then became snow blind, and finding himself lost tried to get his horse to take the back trail, letting the horse find it for himself.

This failed, and next the man, taking off the saddle, turned the horse loose, thinking he would find his way home, then cause a party to be sent out to hunt his rider.

The horse refused to leave, but stood over the man as he lay there until he was found by a mail rider five days after this. Why the man did not freeze to death at night long before this is not explained. Most men who are sent out as couriers are men who are not likely to get lost in the first place, and if they do happen to get lost, they have generally brains enough to find themselves again. I have often ridden as a courier,

but would be ashamed to get lost so badly anywhere that it would need some one else to find me. A country that is covered with snow looks far different, even to a man who knows it well, from what it does when covered with grass; but one must bear that in mind and keep his eyes open; if he does that and uses his brains he won't stay lost long.

I once had a job hunting up a lost man, but this one left on foot and was a man who would be about as likely to get lost on Broadway, New York, as he would on the Staked Plains, where he did get lost.

The Fourth Cavalry began to build Fort Concho in the fall of 1867, our troop H being the first one to start at it, but several other troops came soon after. That winter a few of our horses took what was called in after years the epizootic, we thought they had the glanders, and as no horse could be shot until it was sure that he had the disease, unless the officer who was charged with him wanted to have to pay for him, we tied the sick horses out in the timber away from the post, to observe the course of the disease, feed and take care of them. But we only had to do that one day; then the Indians relieved us of the job; for on the second night a small party of the Kohowdi Comanches made a raid on the horse hospital and lifted the whole of them. There could not have been a horse doctor in the band, or they may have been in too great a hurry to start for home to call the doctor. The horses were missed next morning, and a detail was sent after them. About noon they overtook the Indians, who dropped the horses and lit out. All except one of them escaped; this one a sergeant ran down, and after having a running fight with him, shot him, then took his pony, bow and arrows and shield and a Colt pistol, and brought them back with him. This sergeant was a young, smooth-faced fellow twenty-two years old; he had come from a good family in the East, had been turned out of a law college for some scrape, and then had come to us; he had probably been the black sheep of his family, but he conducted himself all right here, and on account of his being better educated and keeping himself neat and clean a great many of the men disliked him and gave it as their opinion that if an Indian would get after him the sergeant would faint. I had seen a good deal of him and thought that when the Indian did get after him it would not be the sergeant who would do the fainting; and the result proved that I for once was right.

When the sick horses were brought back, Major Cram, the commanding officer, announced that he would now proceed to drive these Indians to—well to a country where the squaws would not need to pack in any wood if the climate of this country is as warm as it is claimed to be. The major did not know then what a large contract he was giving himself and us. He never drove them anywhere in his time, though the rest of us kept on driving them on and off the Staked Plains for the next few years, until finally, on the 20th of September, 1872, our troop, F, of the Fourth Cavalry, under Major Wirt Davis, single-handed and alone, drove them into the North Fork of the Red River, then after thinning them out drove them on a reservation to stay on it.

After I had got to be a part Comanche myself, I asked them about this affair of the sick horses, and was told that the young man we had shot was the chief's son, and that when his party had got home minus any horses the squaws had lamented his death in sack cloth and ashes, principally ashes.

The major sent a troop after the Indians, and there not being men enough in this troop he detailed nine men and myself—I was a corporal then—to go with this troop.

We traveled northwest up as far as the Double Mountains, then directly west to a fine creek known afterward among us as Catfish Creek. The Indians had been in camp here in several places; it was their favorite camping ground always, but they were not here now, they had no doubt seen us coming and had made a hurried march out on the Staked Plains that begin right here at the creek.

We put in several days going up and down the creek, to make sure that the Indians were not on it, then went into camp here. I went as far out on the plains as it was safe to go, and wanted very much to get a chance to cross them clear to the Pecos. I got the chance several years after this, and saw a good deal of them, and while on them saw the only lunar rainbow I have ever seen; it was a beautiful one, too.

After this, Catfish Creek got a visit from us at least once a year, but with one exception the Indians were never at home when we called.

The exception was in the fall of 1869. Major Bacon, with a large command of colored troops and thirty-six of us white troops, paid them the annual visit and took in a few families that had been too slow about packing up; they were doing this when we called on them. We lay in camp a few days to rest the horses, we could not follow the Indians across the Staked Plains; in fact, it was supposed at that time that these plains could not be crossed without a good guide who knew where there was water. When we crossed them years after this, early in the spring, we found plenty of water; later in the season most of these small ponds would be dry, no doubt, but these plains may be farms now, plenty of water could be found on them by going down deep enough.

Our rations were running short, and the captain prepared to return, intending to go east of the Double Mountains, then south as far as an old post called Phantom Hill on the Clear Fork of the Brazos.

This post had a curious history. It was built by a few companies of an infantry regiment about the year 1859, and as soon as they had it finished they were ordered away, and when leaving they camped the first night only ten miles away. That very night the post was burned. The Indians got the credit of burning it, of course; but years after I learned from a man who

*This is the way the editor spells that tribe's name. I have always made it Cohattie, and have never but once seen it in print when written by any one else until now, then it was spelled Quehada. I am not a good enough Spanish scholar to be able to pronounce that properly. I called the name of the tribe as it sounded to me when they themselves pronounced it.

had helped to build it how it had been burned. While the infantry were in camp this night, a man borrowed a horse belonging to an officer, without going through the form of asking for it; and riding back to Phantom Hill set the whole place on fire. When I first saw it all that remained were the stone foundations and a small stone magazine.

The captain meant to send a courier in from Phantom Hill to the Concho and have rations and forage sent out to meet us; then we started and had got back as far as this small California creek and were in camp on it when, one afternoon, soon after going into camp, a corporal and half a dozen men went off hunting on foot. They came in again about an hour before sunset and reported that they had shot a buffalo three miles west of camp, and had left a man named Caldwell to keep the wolves off from it until they had brought out a mule, if the meat was wanted. The captain did not want it, as the corporal ought to have known; we were then getting as many buffalo as we wanted without hunting for them. He told the corporal to go and bring the man in, but on learning that the man had orders to come in before sunset, he told the corporal that he need not go. But Caldwell did not come in; and early next morning the corporal was sent out to where he had left him to see what had become of him. The corporal could not find him. Soon after this the first sergeant of the troop told me to report to the captain. "He wants to send out and see what has become of that man, and I told him that you knew the country, don't you?" said the sergeant.

"I know it no better than the rest of you. This is the first time I have been in it. But I have kept my eyes open while we have been in it. I can find him unless the Indians got him ahead of me."

The captain asked me what I thought had become of the man. "I hardly think he would desert here, do you?"

"No, sir; he has got lost. He may have remained out there until after dark, then has missed the camp. There is no telling where he is now, all I can do will be to find his trail if I can, then follow it."

"Go and do it, then, and when you have found him or are satisfied that you cannot find him, join me at Phantom Hill. I will remain there a few days. Now, in what direction is Phantom Hill from here?"

I gave him the direction.

"Yes, that is right. You won't get lost, I think. Go and do the best you can; I am not to blame for the man getting lost, but I hate to lose a man; we all do."

"I won't get lost, sir; I can travel by the map and compass; I have both of them here."

I had a copy of the same map the captain had and a good pocket compass, and never left camp without taking them with me.

I filled my horse's nose bag with wheat biscuit and raw bacon to carry as rations. I always carried a small bag of coffee, one of sugar and another with salt in it in my saddle pockets, along with a lot of extra ammunition, a small camp hatchet, and a pair of front shoes for my horse with the nails to put them on. I shod him myself, never letting the blacksmith touch him; he would want to put on heavy Burden shoes, then let them stay on until worn out; I wanted light Good-enough shoes on him and wanted them re-set or replaced once in every six weeks, and the quickest way to have that done was to do it myself. Any time that I was a troop quartermaster-sergeant no horse had to wear his shoes out before having them reset, but I was not one now.

I had a young greyhound, Spot, with me here, he went along also, and it was he who found Caldwell. I first went to where the buffalo had been killed, to try for the man's trail; but the corporal had been here on his horse to-day and had ridden and tramped all over the place and I could not now tell one man's trail from another. Next, going back on the prairie toward camp, I rode slowly around in a half-circle, but found no trail. Then trying the prairie to the west of this, I at last struck a trail, but it led straight west, and I followed it.

This country out here has a number of large creeks, most of them running south, while their branches came in from the west. Most of them were nearly dry now; what water was in them stood in pools; the most of it was brackish, to begin with; and the buffalo that used it did not improve it any.

I followed the trail at a walk for a mile or two; then it crossed a dry water course, and after a short time crossed it again. He had been going here in a circle, and his trail led out on the grass again. He was going east now at last.

Just now Spot, who had run ahead of me, stopped, and after smelling at something on the grass, began to eat it; going to him I found about ten pounds of that buffalo's tenderloin. I had noticed it missing when at the buffalo, but did not know which of the men had taken it. When we shot a buffalo we would take the tongue and tenderloin, even if we left everything else.

I picked up the trail here again, and soon after it led back to this dry creek, going directly west, and following the bed of the creek. I could follow it at a gallop, and at the same time keep a good lookout all around the country for Indians. It was true that we could not find any of them out here, but they were here, that I know, and could find me without any trouble. The trouble would commence when they had found me.

At last I came to the head of this dry creek, and here the trail took the grass again, still going west, and it was quite fresh now. I kept following, and when I had gone several miles further the trail led into another creek that had a pool of water in it here, and stopping I watered my horse, while Spot, who had drank already, ran on and up on a small rise, then stopped and began to wag his tail—he never barked at anything. I galloped to him, but the dog, instead of going on as he generally did, stood there looking up the creek; and looking up it myself I found my man, about 300 yards away on the side I had just left. He was kneeling with his back to a low bank, and his carbine up and pointed at me. I had heard of men who, when lost, had gone crazy, but I hardly expected a man would lose his mind in less than twenty-four hours.

Caldwell had no doubt been looking for Indians until now he had them on the brain, but I did not want him to shoot me for one. Taking off my hat I waved it, and then called his name. He still kept the gun up.

I got off my horse, and then going to one side held both my hands up; then calling my horse to follow we went slowly toward Caldwell, keeping a good look out that he did not shoot me. I was ready to drop at the flash of his gun.

Caldwell jumped up now, and throwing his gun down began to dance. Then I ran the rest of the way to him.

When I had got to him the first question he asked was, "Where am I?"

"Why, you seem to be right here. I don't see any of you missing," I told him. "Where did you suppose you were?"

"Well, where is camp?"

"Oh, camp is a little short of 24,000 miles from this. That is, if you mean to go to it by the route you have been taking. It is only about twenty-five miles behind you, though, that is a shorter route. What brought you here?"

"Why, I started after dark and must have taken the wrong direction."

"That is what you did. You should have gone east; you went west."

He had taken his boots off and his feet were so badly swollen that he could not get them on again, so I sent him down to the water, telling him to bathe his feet, while I made camp and got us something to eat. Then after I had taken off my saddle and staked my horse out on grass, I started a fire and boiled coffee.

I was well pleased, I had found my man in less than twelve hours after starting to hunt him, but it would be a job now to get him to Phantom Hill. I would have to do most of the walking, while he rode, and I had no use for walking, else I should not be in the cavalry.

Caldwell got back just as I had the coffee boiled and we ate supper, he would have eaten about all I had if I had let him; but I told him to eat only moderately, this being the first he had eaten since yesterday morning. We were only fed twice a day when on the march, and he had missed his supper last night. He said that while he was bathing his feet he saw what he took to be a lot of deer come across the prairie toward the water, but they saw him and ran back again.

"They were antelope, most likely," I told him. "I have not seen any deer here, but just before sunset I will go down and wait for them; I want one; I would sooner have them than the buffalo. If I can't get one I must shoot a buffalo, we must have something to eat."

Just before sunset I had Caldwell ride my horse down and water him, then had the horse tied out where he could not be seen from the water. Then going about fifty yards from the pool I lay down in the grass to wait for the antelope. The buffalo were coming in in long files for water. I did not want them here, but was afraid to run them off lest I might scare off any antelope that might be following them, and if the antelope did not show up before it had got too dark to shoot I would drop a buffalo. At last I saw a band of half a dozen or more antelope coming in from the west just across from where I lay flat in the grass. I let them come, meaning to shoot one just as they were leaving; but as they reached the water one of them threw up his head and looked in my direction; he had winded me.

I cut loose on them now with the Spencer, and put three shots into them just as they started to run, and one of them dropped. Then I stopped firing and going over to him found him to be a rather small one, but more than we needed; and carrying him down to camp I got my saddle on, then put him and Caldwell on it, then carefully putting out my fire, I moved back a mile or more away from this water and camped for the night without fire, just as an Indian would do when in the enemy's country. Then I got my antelope dressed ready for breakfast and to carry with us to-morrow.

"I cannot imagine," I told Caldwell, "what ever led you to go west. A school boy would know that as we had come from the west and you had left camp west of it, the camp must be east of you."

"How could I tell the east from the west after night?" he asked.

"I can, and if I could not I would not move an inch from where night found me."

"Well, we ain't all scouts and trailers," he said, "and anyhow, I never paid any attention to where camp was when I left it. I expected the rest to do that."

"Well, depend on yourself after this; and if you do get to be a scout and trailer it won't hurt you any. If you had been one you would not be here and need not furnish a subject for a lot of fools to laugh at when you get back. Some of them would get lost as easy as you did, but that won't prevent them from laughing at you."

We took turns sleeping and watching; I did not want to run any risk of losing my horse; there was small danger of our being found here, but it was well to be careful. At daylight we were back at the water ready to get breakfast, and were ready to start soon after sunrise.

Caldwell now began to study the first principles of a scout. He wanted the points of the compass, and pointing to the sun that was just rising he asked, if that was not east.

"No, not exactly east; it is a little south of it."

"Well, when I went to school the sun rose in the east and set in the west."

"You only thought so. In fact, it has about 360 days in the year in which it does not rise in the east nor set in the west, but it comes so near it that we can use those points if we have to to determine the east and west. I use the compass." And taking it I gave him the true east.

I followed my trail this day back to the camp I had left to come here, and it was well I did so. I had looked at the map before starting this morning, and had seen that to go through this camp would not take me much out of a straight line, and I knew that there was water there; I might not find any by keeping west of it without having to go too far for my horse to travel and keep in good order. He was not getting any forage now and had not had any for the past two weeks.

Caldwell and I rode turn about to-day, each of us riding five miles at a time; he had been able to get his boots on again this morning, and could do his share of the walking, I telling him that he was a better walker than I was—his trip west had proved it. I got to the camp I had left yesterday morning at about three o'clock in the afternoon, and on going into it the first thing I saw was a paper tied to a tree where I would not fail to see it. The captain had left it to tell me if I came this way to follow him into Fort Griffin; he had concluded to go there and not to Phantom Hill. I had been wondering why he did not go there in the first place, but I suppose he may have thought that they would not have much forage or rations there to spare him. This was a new post that had been started after our post at the Concho had been begun, and everything needed at both had to be hauled by ox trains all the way from San Antonio. Griffin was built on the Clear Fork a few miles west of the old town of Palo Pinto.

Caldwell wanted to go hunting again as soon as we had made camp.

"No, not to-day, I don't want to do any more hunting for you; take a rest here to-day. I mean to go clean through to Griffin to-morrow; it will be a long ride but my horse can stand it. There is a feed of corn for him when he gets there."

We started as soon as it was light enough to see the trail next morning, and got into Griffin a few hours after the troop did, they having taken two days to go in while I made it in one.

Then I reported my return and turned Caldwell over to the captain, I had expected that he would get a calling down from the captain; but all the captain said to him was, "You have got off very lucky, Caldwell; you probably owe your life to the corporal. After this keep your eyes open and watch where you go; it pays to do that in this country."

CABIA BLANCO.

Camping in Ontario.

III.—A Rainy Day.

Drip! Drip! Drip! No heavy showers had fallen during the night; yet the branches of the pines drooped with the weight of moisture in them, weeping copious tears upon our shrouded island—like near relatives. From the doorway of our camp shack we cast our eyes about, from the ground to the water, from the water to the nebulous mist that hung above it, from mist to sky, and from the sky back to the ground and the saturated branches of the trees. All were in league. The ground seemed to perspire in all places; the lake's surface gave off a vapory steam; somber night clouds seemed to linger in the vault of the sky as the first smoke of the camp-fire lingered in our shack; and down through the fog percolated a fine, misty, drizzling rain. Drizzle, drizzle; drip, drip. When a breeze should start to blowing from the bay, and things should cool off a bit, we might expect to receive our showers clean-cut; but that would come later in the day.

Upon high, bare limbs of three of the tallest of the dead, white pine trees of "Burnt Island," across the way, sat three stately eagles. A rain storm is always a thing to rejoice over in the feathered kingdom. Like three grave saints the birds seemed silently to return thanks to the Sender of all Good Things. It seemed to be their hour of consecration. Irreverently a small rifle was produced and bullets were fired; but the aim being poor at that distance they made as little impression upon the eagles as a peasant's gibes upon a king.

The breakfast fire sizzled and sputtered, meanwhile, with a noise like that which comes from a blacksmith's tempering tub. Drip, drip; drizzle, drip. It took the guide longer to get breakfast than usual, so it seemed; but we were not without employment in the interval in searching out our rainy-day apparel.

After our morning meal we made ready to put off, as usual, in the canoe, this morning determined to coast along the shores trying each favorite hole and testing the truth of the commonly accepted belief that fish bite best on rainy days. Out upon the water it seemed that the rain fell to more purpose than previously. A million fine drops made their quick impacts upon the water's surface, each creating a tiny series of rings, the widening forms of which were immediately destroyed by succeeding drops. A light breeze, at first scarcely perceptible, but feeling comfortably cool against the wet cheek, began to give a slant to the rain. The mist above us vanished so stealthily that our first knowledge of its withdrawal came when, chancing to glance skyward, we ascertained that the clouds had taken definite shape and that they moved with the upper air currents. Now a darker cloud blew over us and the rain from it came in larger drops and more fiercely, so that instinctively we drew our mackintoshes closer about us; now it came again mildly.

The soft "thur-r-r-r-r" that comes from an unreeling line when the bait is cast, and the gentle splash as the bait strikes the water, told me that my companion had stolen a march upon me; but my laugh was best, for he was soon permitted to take from his hook a hungry "rockie" for his pains. How voracious the rock bass were! A moment's fishing in that place taught us that we must move further on for the small-mouths. Holding our rods expectantly aloft, like delicate masts to our canoe, we drifted slowly near the wet foliage of the shore, impelled by an occasional dip of the paddle, and cast our frogs or bits of perch into this or that likely appearing hole. Suddenly I knew by a quick bending of my rod that a fish had struck. With a rapid succession of movements my rod whipped the water's surface as the bass swam with powerful tug in a downward slant under the canoe. A momentary release of the reel freed my pole; but now I found it necessary to reel in quickly to take up the slack, for the fish had turned upward in another direction. Away he went with it again, however, tugging like a spirited horse upon the reins. With instant courtesy my companion for the day attempted to handle our bark in the manner which should prove most to my advantage in the struggle. Ever alert between the necessity of letting out line and of taking in slack, so that the fish should not be left for a second without proper bridle, I held firmly to the throbbing pole, while the fish dived, rose, tacked this way and now in the opposite direction,

at one time keeping the pole bent and the line taut, and at another time making me work to keep them so. Now he dived under the canoe; now he started upon a straight away run, tugging with all the vigor that was in him.

At the end of one of these long runs I felt a sudden slack in the length of line I had let out; and before my reel could do its work a splendid fish leaped clear of the water and dived back with a powerful twist of its shining body, striking the water with a great splash. My hand worked quickly, nervously, at the reel; but a turn or two told me that the fish had thrown the hook. Groans of regret escaped from my companion's lips before I could bring in the line for a glimpse of the empty barb. Immediately he pronounced the fish a "whopper," and the "king of bass"—and I believe it grew faster there in ten minutes than it had ever done before in an entire season or two.

Again and again we cast into this deep hole from which the grandfather of bass had arisen, and once or twice we thought that we had tempted him; but not again could he be coaxed above the rain smitten surface. Once especially a vigorous tug and pull aroused momentary hopes; but the fish that was hooked was brought quite easily to the surface and proved to be a lusty pike. Throwing this fish disgustfully back into the water—to which he took very kindly, indeed, dashing immediately away in quest, no doubt, of a fish surgeon to patch his lacerated jaw—we gave up the bass for that day and paddled down the lake for other grounds, talking over the encounter on the way and planning how we might catch the fellow at another time.

Shower after shower swept over us. Whenever, looking behind us, we saw a heavy wall of water advancing down the lake, we merely paused in our fishing, meekly took the dousing and proceeded again good naturedly when the cloud had passed. But our sport, for some reason, began to give out. This was due, I think, to the fact that rock bass, perch, and bullheads looked upon our bait as legitimate food for their stomachs and rushed upon it with their rainy-day appetites whenever it came within their reach, leaving the more wary bass to appease their hunger elsewhere. Overwhelmed at last by this voraciousness of the common rabble of fish, we settled down at a likely pool to catch for the morrow's breakfast a mess of bullheads—lazy, yet savage fighters, whom one, nor two, nor three pricks of the hook does not teach discretion.

So our rainy day became a careless, jolly day, as such a day will. We laughed immoderately at each new wetting. We ate our luncheon between showers, with poles in hand, remaining in the canoe all day. As the afternoon wore on the sun burst now and then through the clouds, lighting up distant storm areas and adding a peculiar beauty to the showers that passed over us in shadow and receded with the light upon them.

Resuming, upon our homeward journey, however, our more serious fishing, we whipped each likely pool with thoroughness. So zealous were we, indeed, that, in hugging the shore line, we passed unwittingly beyond our camping place, and when, at last, we turned the nose of our canoes about we beheld the island in the mellow light of a waning sun. For a moment before dipping the paddles we lost ourselves in admiring contemplation of the picture; there, arching the eastern skies above our camp, we beheld with fresh joy that signal of the mightiest of truces—the Bow of Promise.

Natural History.

Wild Rice.

IN FOREST AND STREAM of March 29, 1902, we called attention to Mr. Albert Ernest Jenks' most interesting paper on the wild rice gatherers of the Great Lakes and said something of the importance of this food to primitive man in this country and to many of the wild creatures that at certain seasons swarm over our inland waters. There has just been issued by the Bureau of Plant Industry of the Department of Agriculture an interesting paper on Wild Rice: Its Uses and Propagation, which contains so much information and of so practical a sort that we are glad to make full extracts from it here. The many unsuccessful efforts made by gunners to propagate this food for wild fowl justify our speaking of it at length, and it is advised that this article be retained for reference. From the article we take the following paragraphs:

The importance of wild rice as a food for wild fowl and the interest in its artificial propagation are indicated by the large number of inquiries regarding it that have come to the Department of Agriculture during recent years. These inquiries have emanated from many different localities widely separated, thus showing that the interest in this plant is not confined to any limited region. The general demand has been to know where viable seed of this plant could be obtained and how and where it should be sown to bring successful results. Some interest has also been manifested in the possibilities of preparing from this seed a commercial cereal food.

The seed of wild rice has been used for food by the Indians, particularly those of the middle Northwest, since as long ago, at least, as the first acquaintance of the white man with their customs. Notwithstanding the abundance of other forms of cereal food, such as flour and corn meal, since the advent of the white man, the Indian of the upper Mississippi Valley has continued to use large quantities of wild rice, and this, too, in spite of the fact that the harvesting and curing of the seed require considerable arduous labor. Wild rice, as prepared for food by the Indians, is highly esteemed by the white men who have had the opportunity of testing it, and the entire available supply now sells at from two to three times the price of ordinary white rice.

While by far the largest demand for information regarding this plant has come from men or organizations wishing to secure viable seed for planting near shooting grounds to attract wild fowl, the possibility of preparing from the seed a large and regular supply of a nutritious and highly flavored cereal food has received some attention. The importance of maintaining good

feeding grounds for wild fowl, of which the propagation of wild rice is a very important element, needs no discussion, and the desirability of propagating a plant which will make the otherwise waste-water areas of the upper Mississippi Valley yield a valuable and highly esteemed cereal is also evident.

Distribution and Habitat of the Plant.

The wild rice plant (*Zizania aquatica* L.) occurs naturally over a wide area in the United States and southern Canada. The same species is also reported from Japan, Formosa and China. It finds its best environment in the United States in fresh-water lakes and river sloughs and along the seacoast where streams meet tidewater. It requires that the water in which it grows be fresh, that is, not brackish, and that it be neither quite stagnant nor too swiftly moving, and while it thrives on a wide variety of soils under these waters, it does best where the bottoms are soft and muddy.

The change in water level, where the plant grows, is an important item. For instance, it will frequently fail to do well or to grow at all in some of the northern lakes through which the Mississippi flows, especially if the annual change in water level in these lakes is more than 2 or 3 feet. There is, on this account, in the minds of some observers an opinion that wild rice normally grows only alternate years, or, at least, that it does not grow every year in a given locality. This idea is without foundation, and its existence is probably due to the fact that occasional years of high water prevent the development of wild rice for that year, while a normal level the following year permits the regular growth.

This calls attention to the peculiar vitality of the seed of this plant. It is evident that if the growth of wild rice in a given locality is wholly prevented for a year by high water, and there is an abundant growth the next year when the water level is normal, there must be a large proportion of the seed which remains dormant and viable for at least eighteen months after it reaches maturity.

In streams affected by tidewater, however, where the daily change of water level sometimes amounts to 3 feet or more, wild rice may grow vigorously. It is abundant along the shores of the lower Potomac, where it grows on mud flats that are nearly or quite exposed at low tide and submerged by 2 or 3 feet of water at high tide. The plant has, in this case, become adapted to this frequent change of water level, but if for any reason high water were retained over these beds for any considerable length of time during the early spring the plants would hardly develop.

Wild rice will grow on a wide variety of soils, but it needs for its best development approximately the following conditions:

Soft alluvial soil, covered with from 12 inches to 4 feet of water. The water level should not have an annual variation greater than 18 or 20 inches. The water should be constantly freshened by slight movement and consequent aeration.

Life History and Natural Propagation.

The wild rice plant is an annual. It bears abundant crops of seeds which fall directly into the water as soon as ripe and lie buried in the mud below until the following spring when, if conditions are favorable, they germinate and produce new plants. In the northern lakes the long ribbon-like leaves appear floating upon the surface of the water late in May. By the latter part of June the stems have grown sufficiently to raise the leaves above the water. In the South the growth starts much earlier. On the mud flats of the lower Potomac the plants may be 6 inches high by the first of May. Strange as it may seem, the period of flowering and ripening of wild rice is almost the same in northern Minnesota and along the Potomac River, near Washington, though on account of the earlier start in the southern region the period of growth is much longer.

The panicles appear during the latter part of July, and the flowers open immediately. The glumes of the pistillate flowers separate at the base to allow the stigmas to protrude and be pollinated and closing again soon after fertilization is accomplished leave the withered stigmas outside. Immediately after fertilization the young seed begins to elongate, and gradually fills the space within the floral envelope. This development requires about two or three weeks, and as soon as it is completed the connection with the stem is weakened and the seed falls off. The time of maturing of the different seeds in a single panicle extends over several days, the seeds on the tips of the branches ripening first.

The seeds, on falling, usually strike the water with the point of attachment below and sink immediately to the bottom. If by accident the distal end strikes first, enough small particles of air are caught by the barbs borne there to keep the seed on the surface of the water for a time, but as these air bubbles escape the seed sinks.

Varieties.

While distinct differences in size and form of panicle, the coloration of the plant, and the size of the seed have been noticed in wild rice from various regions, there is as yet insufficient evidence to justify making a new species. It is impossible to say at the present time to what extent these differences are due only to environment. The wild rice of northern Minnesota and that growing along the lower Potomac show the extreme variations in some respects. The Potomac plants grow 8 to 10 feet high and 6 to 7 feet above the water and have a very large panicle, often exceeding 2 feet from the lower joint to the tip of the pistillate end. The pistillate portion of the panicle in the Potomac plant is distinctly spreading and the branches often bear 17 to 27 seeds. The plant common to the northern Minnesota lakes is smaller than that of the Potomac, usually reaching only 3 or 4 feet above the water. The panicle is shorter, rarely if ever exceeding 20 inches in length, more often 16 inches or less. The pistillate portion rarely exceeds 10 inches in length and usually has its branches closely appressed. When spreading of the

branches of the pistillate portion of the panicle does occur in the wild rice of the northern lakes it is seldom that all the branches of a panicle are spreading—frequently only 1 or 2 of them, rarely more than 4 or 5—and the branches of the panicle of the Minnesota plant rarely carry more than 9 seeds, usually from 3 to 7.

The seeds from northern varieties are larger, particularly much thicker, than those of the Potomac variety.

There is also in the northern-grown wild rice a marked distinction in coloration. Some of the plants are a rich purple color in the panicle, and have a large amount of purple coloring in the leaf sheath and along the margin of the leaf blade, while others remain with almost no suggestion of any color but green, except, perhaps, a pinkish tinge in the glumes of the staminate

FRESHLY GATHERED WILD RICE DRYING ON A SCAFFOLD.

flowers. The stamens in all cases are uniformly of a rich bright yellow, and the mature seeds are always black. Some seeds are green or greenish brown in color, but this is due to their immaturity. It is difficult to understand this difference in color in wild-rice plants. It has been shown that the plants are uniformly cross-pollinated, and plants of both colors grow side by side in the northern lakes, though in some localities plants of one color or the other predominate; and while one may find a few cases of colors intergrading between these two, the extremes of coloration are the rule, and, except in rare cases, marked coloration, when it occurs, extends throughout the plant. For instance,

INDIAN WOMAN PARCHING WILD RICE.

a dark purple pistillate panicle almost invariably accompanies dark purple staminate flowers, and a large amount of that color in the leaf sheath and blade. Color variation is found in the Potomac wild rice, though to a much less degree.

Harvesting the Seed.

Almost all the wild rice seed now harvested is gathered by Indians into birch-bark canoes. This is done usually by two persons working together, one standing in the bow of the canoe and propelling it with a forked stick, and the other seated in the stern with two short sticks, by means of which the plants on either side of the canoe are gently pulled over it and the ripe seed beaten off. No attempt is made to get all the seed off the plants at one time. It is customary rather to take only the seed which falls readily and to visit the same plants later as more seeds ripen. The period of ripening extends over nearly two weeks for any field and over several days for any single plant, so that were one to attempt to harvest all the rice on a given area it would be necessary to go over that area at least four or five times at intervals of from two to three days. Recently some attempts have been made to construct machinery for harvesting wild rice seed from boats driven by screw or drawn by cable. So far, however, such endeavors have not been entirely successful.

It is customary in some sections for the Indians to prepare wild rice for harvesting by going through the field before any of the seed is quite ripe to draw the heads of adjacent plants into bunches, which are firmly tied together, so that the seed, as it ripens, will not fall. This custom, however, is not universal, and is only resorted to when the supply of wild rice is not abundant and it is desirable to gather as much as possible from certain fields. When a portion of a field is so tied up it can be left until after all the untied seed has been harvested or has fallen, and in this way the harvesting period is extended. This preliminary tying is, of course, a tedious operation, and would be expensive

were the time of the operator a salable quantity. The harvesting of wild rice is not regarded by the Indians as a particularly arduous task, though attempts by white men to do the same work have not proved very successful.

Preparation of the Seed for Food Purposes.

After the wild rice seed is harvested into the canoe, it is taken ashore and put in piles or spread out for a preliminary drying. (Pl. VI., fig. 2.) If allowed to remain piled up for more than a few hours when fresh, fermentation sets in, as the seed is very damp and soft when gathered, so that almost immediately after it is harvested it is either spread out thinly to dry, or is parched ready for hulling. The parching is at present done by the Indians in a very primitive way, as is shown in Plate VI., fig. 1. The seed is put into a kettle over a slow fire and stirred with a stick until it is roasted, so that the hull is brittle enough to be easily broken. Not much more than a half bushel can be parched at a time, and it requires from half an hour to an hour to parch a single lot, and the seed demands constant attention throughout the parching process to keep it from burning. Unless stirred evenly the kernels pop open or become so brittle as to break up badly in the subsequent hulling process. There is a most excellent opportunity for the development of some simple device for the uniform parching of wild rice seed. The parching is what gives the seed its highly esteemed flavor as a food, and if this operation and the subsequent hulling can be done uniformly the percentage of burned and broken seed will be much less than at present, and, furthermore, the cost of production of the food will be very greatly reduced.

After the seed has been parched it is spread out to cool, and soon after it is hulled. The hulling is at present the most tedious operation in the whole process of preparation. The Indians ordinarily accomplish it by putting about a bushel of the seed into a hole in the ground, lined with cedar staves or burnt clay, and then beating or punching it with heavy sticks. Often three or four men work together on one lot. After the seed has been beaten until the hulls have all been cracked or broken, the grains and hulls are separated by tossing the mixture up into the wind from light birch-bark baskets. After the parching and hulling are finished the grain is sufficiently dry to keep indefinitely. Plate VII. shows some wild rice seed with the hull on, some with hull removed, and some parched seed, also with the hull removed.

As a food material this parched wild rice is highly esteemed by those who like the "gamy" flavor which it acquires by parching. It is cooked with wild fowl and also used as a breakfast food. For either purpose it should have several preliminary washings in cold water to remove any disagreeable smoky taste. It is also used to a limited extent for making rice cakes. For this purpose it is milled and the darker outer coat is sifted out. When milled without being parched this outer coat is difficult to remove, as it breaks up into small particles that do not readily separate from the flour, so that for all use as food the seed should be first parched and hulled.

The results of chemical analysis given below show approximately the comparative value of wild rice for food purposes. For the table and the statement concerning it the writers are indebted to Dr. C. F. Langworthy, of the Office of Experiment Stations of the Department of Agriculture.

The Food Value of Wild Rice.

Wild rice resembles common cereal grains quite closely in composition. As is the case with wheat, rye, barley, and other grains, the greater portion of the nutritive material consists of carbohydrates, although the amount of protein is proportionately large. Wild rice contains little fat, in this respect resembling rice, barley and wheat more closely than corn and oats. Judged by its composition and fuel value, it compares very favorably with the common cereal grains. So few analyses of wild rice are available that but little can be said regarding the range in the proportional amount of the different constituents. Furthermore, little is known of the comparative digestibility of wild rice and other grains. From its extended use by the Indians and others it seems safe to assume that this grain is wholesome, and as said above, analysis shows that it is, like the more common cereals, a nutritious food.

When wild rice is soaked in water a peculiar odor is noticeable, recalling that of damp hay. When it is boiled it also possesses a characteristic odor, something like that of boiled barley. The raw grain has a starchy taste, while the cooked grain resembles barley much more than white rice in taste. The flavor is characteristic and is relished by many. When cooked, the wild rice kernels expand to about two or three times their original size, and except for the bits of dark outer covering ordinarily present the cooked material is of a grayish-white color. In Minnesota and adjacent States, where wild rice is best known, it is usually eaten as a breakfast cereal, or cooked in much the same manner as ordinary white rice.

Artificial Propagation.

When wild rice seed is to be used for propagating purposes it is now customary to secure it from Indians as soon as possible after it is harvested, and to spread it out thinly over some sort of a floor in the shade and stir it frequently until it is dry. Since it has been extremely difficult to germinate seed so treated, or to secure successful plantings from seed obtained upon the market, there is good reason for believing that it is the present methods of curing seed that are at fault. It was largely for the purpose of determining where this fault lay and how best to remedy it that investigations were instituted. It is true that many of the unsuccessful plantings made during the past owe their failure to the improper selection of the place for planting, due to ignorance regarding the nature of the plant and its environmental requirements; but it is certainly true that the plant may grow in many localities where it is not now found, provided good seed is obtainable.

Previous Failures in Planting.

Some instances are reported where successful plantings have been made, but the greater number have proved entire failures. This is no doubt due to the fact that the seed which is ordinarily obtained from the Indians, is treated in such a manner as to kill the germ. It is allowed to ferment during the curing process or to become too dry, either of which conditions seriously injures its vitality. Practically all attempts to germinate thoroughly dried seed have proved unsuccessful.

Plantings Made in 1902.

In order to determine the best methods to be used in curing, storing, and planting the seed, a series of plantings was made both in northern Minnesota and at Washington, D. C. The seed was collected fresh and planted in tubs of mud sunk into the muddy bottoms where wild rice naturally grows. The tubs were covered with fine screens to prevent other seeds getting in and to prevent the removal or destruction of the seed planted. These plantings were examined from time to time. No signs of germination were noticed in the autumn immediately following the planting, but at the time the naturally sown seed around the tubs began to grow, in the spring of 1903, the seed in the tubs was found to be germinating freely, thus showing that when the seed is planted in a fresh condition and never allowed to heat or dry it will grow well.

Plantings were also made by Mr. D. W. Hallam, of Dover, N. H., in a number of ponds where wild rice had never grown. In some the seed was planted in the fall of 1902, and in others in the spring of 1903. These ponds were visited the second week in June, 1903, and the plants were found to be growing well in all cases.

Storing Seed.

Mr. Hallam has succeeded in keeping wild rice seed over winter with its vitality uninjured. The following extract from a letter from him under date of April 15, 1903, shows how this was done:

"The wild rice was ordered with instructions to ship as soon as gathered without drying. I received it on the 27th day of October, 1902. The barrel was placed on end in the shade out-of-doors, the head taken out, with about a bushel of seed, and a faucet was put in at the bottom to drain the water. The seed was weighted with a cover, and cold water enough to fill the barrel put in each morning and drained out daily. The barrel was kept full. On the 5th of December ice began to form on the inside of the barrel. Care was taken in adding water so as not to burst the barrel. By the 25th of December there was a frozen mass of ice and seed that filled the barrel. No water was then added until the middle of March, and then only enough to keep the barrel full, for as yet there was quite a mass of ice and seed. Since April began it has been necessary to change the water daily. Our water here is quite cold, 45 to 55 degrees F. I have sent a sample bottle."

The seed received from Mr. Hallam with this letter had germinated and had sprouts from one-half to one inch in length when it arrived. Later, a larger quantity of seed, about two quarts, was received from Mr. Hallam, of which 75 per cent. had germinated.

It seems from the results of the experiments referred to that wild rice can be successfully grown from seed either by sowing the fresh seed as soon as it is gathered or by keeping it in water over the winter and sowing in the spring. In most instances it will no doubt be found more satisfactory to sow in the fall, providing the place sown can be protected from waterfowl and other animals likely to destroy the seed, since such a practice will avoid the trouble of keeping the seed wet during the winter. When the seed is kept in water, either for storage or transportation, the water must be changed frequently or aerated, as fermentation sets in if it is allowed to stand for any length of time.

The seed can be shipped or stored for a short time by packing it in dampened moss or excelsior, and this is a convenient way to prepare it for shipment. It is necessary to separate the seed from the moss or excelsior by layers of cloth, as it cannot conveniently be sown when mixed with either. The package, when made up thus for shipment, must not be too thick or too tight to prevent some slight circulation of air, or fermentation will at once set in.

Suggestions for Harvesting, Storing and Planting.

(1) Orders should be placed before the harvesting season is commenced, so that the seed may be shipped immediately after it is gathered.

(2) Care should be taken to gather only fully matured seed.

(3) Seed should not be allowed to dry when it is to be used for propagation. For shipment or storage it must be kept wet, with frequent changes of water or packed in damp moss or excelsior in ventilated packages.

(4) Wherever practicable, autumn planting is recommended.

(5) Care should be used in selecting the place for planting seed to get the proper depth of water—from 1 to 3 feet, with a thick layer of soft mud underneath—and the water should be neither quite stagnant nor too swiftly moving.

The Carcajou.

ABOUT that carcajou. I wonder if you are right? My query is because our old standby, Mayne Reid, was, on the whole, a pretty reliable duck on natural history, and it is my impression that in one of his books, I think the "Desert Home," he speaks of both the carcajou and the wolverine as two different beasts, his description of the former being distinctly one of the big cats of jaguar propensities. Ever read it?

J. P. T.

[Carcajou was a name given to several species of carnivora, just as has been the term catamount. Carcajou sometimes meant cougar, or Canada lynx, or even badger. Most often, however, it was used for the wolverine (*Gulo luscus*).]

Our Batrachians and Reptiles.—VIII

WITH the exception of the snakes, there is no other group of reptiles which has taken a greater hold on the popular imagination than the members of the order *Loricata*, a group represented among living animals only by the family *Crocodylidae*. These large animals, commonly known as crocodiles, alligators, caymans, gavials, and jacares, are common inhabitants of the streams, lakes, and swamps of the tropical portions of the earth, where their unprepossessing appearance and disagreeable habits make them at once fit subjects for almost superstitious dread.

We have all read of the crocodiles of the Nile and the Ganges. Along the former stream they were held in veneration and worshipped as deities by the inhabitants of some cities. During life they were attended and fed in temples erected in their honor, and after death they were embalmed and laid away with all the ceremony due to a god. In other cities in the same region the inhabitants, evidently with a better knowledge of the crocodile's real character, regarded them as the embodiment of evil, and destroyed them whenever possible. Along the Ganges, even at the present time, the crocodiles are said to enjoy a certain amount of protection from the natives, but, thanks to the influence of English civilization, they are no longer fed on such tidbits as tender babies or beautiful young women.

There can be no doubt that in some parts of the world, and under some circumstances, some of the crocodilians are dangerous beasts, and do not hesitate to attack other creatures as large as themselves, or even man. There are numerous, apparently well authenticated, accounts of such onslaughts in the writings of various travelers, but it must be believed that in most cases the animals are not as bad as they are painted.

The family *Crocodylidae* is represented in the United States by two species, an alligator (*Alligator mississippiensis*), and a crocodile (*Crocodylus americanus*). The latter inhabits only the lower end of the Florida peninsula, from Lake Worth southward; the range of the former extends from North Carolina to Texas, but is limited to a comparatively narrow belt along the sea coast, except on the larger streams, which it ascends for a considerable distance. It has been found on the Mississippi River as far up as Jefferson county, Miss. In the swamps of Florida, Georgia, Mississippi, Alabama, Louisiana and Texas it abounded until the value of its skin and teeth led to indiscriminate destruction.

In habits both the alligator and the crocodile are eminently aquatic, but may, and often do, leave the water to bask in the sunshine. In times of extreme drouth they may bury themselves in the mud and lie in a semi-dormant condition until their pond is filled again; but usually they travel across country to the nearest body of water. The crocodile is more partial to brackish water, and lives nearer the sea, as a rule, than the alligator.

In general appearance the two animals resemble each other very closely, but differ in many minor characteristics. The head of the alligator is broader and heavier, and the outline of the sides from the back of the jaws to the snout is rather strongly convex, in contrast with which the same outline in the crocodile is straight, or even concave. In the alligator, the teeth of the lower jaw, when the mouth is closed, are completely concealed, as they are received within the upper jaw, but in the crocodile one of the larger tusks of the lower jaw passes outside of the upper lip and is plainly visible from the side. In the crocodile there is a sort of crest or high ridge of large scales along the back of the hind leg, a character which is only slightly or not at all developed in the alligator.

Living specimens in the water may be distinguished by the fact that the upper surface of the alligator's head is nearly flat, while the crocodile has a strong ridge running lengthwise from the nostrils back nearly to the eyes.

The presence of the crocodile in the United States was first made known by Dr. Jeffries Wyman, who secured a skull of the animal from Florida as early as 1870. Five years later, Mr. Wm. F. Hornaday visited its haunts and in a small creek near Biscayne Bay succeeded in shooting a large male fourteen feet in length, and in the weeks following collected quite a series of specimens. According to his account (*American Naturalist*, Vol. IX., p. 498, 1870), the animal is quite rare, is very difficult to approach, and is extremely tenacious of life. They are much more savage than the alligator, and the males fight each other to such an extent that almost every full grown individual shows marks of many conflicts; the teeth are shattered, tails and even jaws are bitten off, and the skin is covered with great scars.

The females produce their eggs in the early spring, and place them in layers in a shallow cavity, which they scoop out in the bank of the stream or pool. Each layer of eggs is covered with grass and leaves, and over the whole a considerable amount of decaying material is placed. The number of eggs is stated to be from twenty to thirty. The heat of the fermenting pile of damp vegetation hatches the eggs in about thirty days. What becomes of the young after they emerge from the nest is not recorded.

The food of the crocodile consists of such mammals, birds, and other animals as it can capture in the water or near its margins. The prey is dragged beneath the surface and either eaten as soon as it is dead or is kept until putrefaction is well advanced, and then pulled ashore and devoured.

The habits of the alligator are comparatively well known, a fact doubtless due to the former abundance of the animal throughout the greater part of its range, and the persistency with which it has been hunted. In the preceding paragraphs, however, mention has been made of the general life history with sufficient exactness, for there is very little to make it remarkable, and only the food and the egg laying habits remain to be described.

The food consists of nearly every kind of animal matter which the alligator can capture. Fish are caught in the water and great destruction is wrought among the wading and swimming water fowl. Small animals of any kind feeding along the bank are liable to be rushed at and captured, and it is said that large animals like cattle and horses have been seized by the nose as they drank. Whatever the prey, it is drawn down under the water and held until life is extinct, and is then dragged ashore and eaten. In the winter the alligator passes a portion of the time in hibernation, and as a preparation for this event is said by old hunters to swallow pebbles and pieces of wood. These, of course, are indigestible, but they serve to keep the walls of the stomach apart and reduce the pangs of hunger to a minimum; in the spring they are ejected as rounded and polished bits of stone and wood.

The time of mating has not been recorded, but in April or May the females repair to some secluded spot for the purpose of laying their eggs. They scrape together a low mound of decaying vegetation and on it deposit a

Fig. 1.—Head of the American Crocodile.

Fig. 2.—Head of *Alligator mississippiensis*.

layer of eggs and cover them carefully with more vegetation. A day or two later a second layer of eggs is placed above the first and covered in the same manner. This continues until from 100 to 200 eggs have been deposited and the mound has reached the height of two or three feet. During the period of incubation, a process which is effected both by the heat of the sun and the decay of the pile of humus, the female remains in the immediate neighborhood of the nest, and is said to defend it with vigor against any intruders. The eggs, which are about the size of those of a goose, are protected by a strong, rough shell, and are so placed in the nest that the slightest disturbance will make them rattle about and give warning to the mother. As soon as the young are hatched they dig their way out of the nest and are conducted to the water by their mother. She feeds them on food which she disgorges and to the best of her ability protects her tender offspring from their natural enemies, the turtles, fishes, and water birds. Nevertheless great numbers of the young alligators perish, probably not more than two or three per cent. reaching maturity. They soon forsake their parent, and probably take no further interest in her movements. Growth in this animal is very slow. At the age of fifteen years they are only two feet long, and a specimen twelve feet in length is probably at least seventy-five years old.

It is only within recent years that the alligator has come into prominence as an article of commerce. When Josh Billings stated of the animal that it "was made for sum useful purpose, but, like the muskeeter, the bedbug, and the kokroach, their usefulness has been carefully hid from us," he was certainly not aware that the traffic in mounted specimens, teeth, and hides would soon amount to some hundreds of thousands of dollars annually. Such, however, is the case, or at least was the case until the indiscriminate destruction of both young and old practically exterminated the animal in many localities where it once abounded. It has been estimated that in the fourteen years between 1880 and 1894 in the State of Florida alone 2,500,000 alligators were killed. In addition

to this innumerable eggs were collected and destroyed, or blown and sold as curios to northern tourists.

The valuable portions of the animals are the skin and the teeth. The former, as is well known, makes a most excellent leather, while the latter are worked up into trinkets of various kinds.

The family *Crocodylidae* was by all the early zoologists combined with the suborder *Lacertilia* under the name of *Sauria*, since all the crocodilians appear in outward form to be nothing more than gigantic lizards. Even today they are often spoken of as lizards; but an examination of their skeleton and the soft parts of their anatomy shows them to possess characteristics which stamp them at once as a distinct group among the reptiles. Moreover, they have been distinct as far back as our knowledge of them goes, numerous fossil remains of undoubted crocodiles having been discovered in the rocks which lie just above the great coal measures. To quote Josh Billings again, our living forms "are chips of the old block." All the members of the family are fitted for an aquatic existence, and the nostrils, eyes, and ears are provided with lids or valves by means of which they can be tightly closed when the body is submerged, an adaptation of the utmost value to an animal which drags most of its food beneath the water. Their legs, although too weak to be of much use on land, are strong enough for their needs in the water. By means of them and their long, strong tails they are able to swim with great rapidity.

They differ from other reptiles and approach the mammals in having a four-chambered instead of a three-chambered heart—two auricles and two ventricles—so that there is a double circulation, and the blood is kept at a higher temperature than that of their relatives. There are also traces of a diaphragm and the teeth are set in sockets instead of simply resting on the bones. The teeth also are limited to a single row in each jaw, and are shed at intervals, the new one growing up within the base of the old one and displacing it. They are further characterized by the possession of a more or less complete armor, consisting of ridged bony plates imbedded in the skin and overlaid by large scales of horny material. The bones of the neck bear ribs which lie almost in contact with each other, and thus deprive that part of the body, to a great extent, of the power to move. In the skull there are numerous peculiar arrangements of the bones, but a description of these would involve too many technicalities and will therefore be omitted.

With these animals, the most highly developed in the class of reptiles, the series of chapters on Our Batrachians and Reptiles comes to a close. It must not be imagined that even for the types described more than the most condensed outline has been given. In many cases our knowledge of some of the commonest and most interesting species is woefully deficient, and in other cases extremely interesting and well known facts have been suppressed. It is the hope of the author, however, that the readers of *FOREST AND STREAM* will be led to pay more attention to the animals which they have been taught from childhood to despise, and in the future try to assist the zoologist by recording such observations as they may happen to make during their expeditions to the forests and streams of our country. W. P. HAY.

Man and the Brute.

Editor *Forest and Stream*:

In the August number of *FOREST AND STREAM*, page 125, A. H. Gouraud objects, in part, to the sensible and interesting paper from the pen of that keen observer, Charles Hallock. Mr. Hallock's paper appeared in July, page 44, and was entitled, "Man and the Brute."

Mr. Gouraud quotes from Mr. Hallock's paper: "Words, or the number used, are not the measure of intelligence, brute or human," and then denounces the statement. He gives his own conception of words: "Words are the implements of thought; without them complex mental processes are impossible; in short, as Max Muller declares, 'thought is identical with language.'"

"Words are the implements of thought" is all right; but the remainder of the statement cannot stand the light of scientific investigation. I don't believe Mr. Hallock will take his science from Max Muller, a Sanskrit scholar. He, doubtless, would prefer Mandsley, Horsley, Golgi, and Rumon de Cajal, modern biological investigators. There are scores of other investigators, too numerous to mention, so one need not go astray if he is a student in this direction. I wonder how Mr. Gouraud disposes of the unfortunate beings that are born deaf and cannot use a word of any language? His theory would deprive them of the power to think, for thinking is a complex mental process which, he claims, would be impossible without words.

Mr. Gouraud gives us another exhibition of impossible science. He writes of the pugilist: "The boxer, of course, has no time to think, and, like the animal, depends upon the operation of habit."

It seems to me that it would be impossible to put more error into the same number of words. If we are to discuss questions from a scientific standpoint, let us have the pure article. Scientifically stated, the boxer sees every movement of his opponent. Suppose a blow is aimed toward his eye, does he act without thinking? If he did he would probably be knocked out in one round. The movement of the coming blow is flashed to the retina. A network of nerves collect the impression and through the optic nerve and its aids it reaches the tract in the brain where the knowledge of sight is located. Consciousness, that has charge of the welfare of that particular organism, is warned and instantly puts in operation some method of defense. The blow could be stopped, or turned to the right or left, or the boxer could step back, or side step or dodge. If the boxer is proficient in dodging it would be the best defense, for the only movement needed would be to jerk the head one side. Consciousness concludes to adopt this method. An impulse is sent down the different nerve channels to a nerve center in the medulla oblongata; from there it is carried to a nerve center in the spinal cord, and then continues to the trapezius muscle, which contracts and jerks the head to one side and the closed hand passes harmlessly by.

I have tried to explain the operation without the use of technical terms beyond those necessary to make my

meaning plain. It may be thought that the movement would be too slow to be of use, but practically the movement is instantaneous. To change an apparent into an efferent impulse, or, in other words, to change a sensory into a motor impulse, takes six-thousandths of a second in time. Now, consciousness may conclude to strike back; if so, an efferent impulse comes down from the cortex of the brain, where ideas originate, and the proper muscles are called upon to give the blow. Want of thought does not enter into a boxing contest. I know this from experience as well as through scientific study.

It seems to me that Mr. Gouraud is playing double. He objects to about every statement in relation to the intelligence of the higher animals, even to man. At the same time he admits everything in the fragments which I herewith quote:

"Animals undoubtedly have a limited vocabulary." It is not to be denied that animals have imagination. I have little doubt that in this particular the horse and various other roving animals have memories equal to or even superior to the best among men. I hold that the marrow never enters its consciousness."

We see from the foregoing that he grants the animals language, imagination, memory and consciousness, with all that these attributes may imply. After granting the dog a superior memory, he makes this statement: "This oblivion of the past and future is the secret of the animal's contentment." I really cannot understand what Mr. Gouraud is driving at. He emphatically denies that an animal's ears may be manipulated to mean yes or no, and then goes the theory one better by claiming that an animal's ears, retracted, is a sign of displeasure, real or affected. Then he goes on to state this proposition: "An animal that will invent signs for yes and no will not stop at that accomplishment." How about an animal that invents a sign of *real* displeasure? How about the same animal that invents a sign for *affected* displeasure?

Consistency thou art a jewel!

I will quote once more from Mr. Gouraud's paper: "A dog, upon observing evidences of an impending outing, may be transported with delight, but his emotion is stirred by visible and well recognized preliminaries. That he ever of himself contemplates such outings I do not believe."

If I mistake not the writer will hear from dog lovers, but here in the woods I see evidence that dogs contemplate an outing. They come in pairs, without their masters, to hunt rabbits. One mismatched pair hunted near my cabin for years. One was a small beagle, the other a big Saint Bernard. As the years passed the big fellow got too fat to hunt; besides, his feet were tender. I well remember the last hunting they did. Three or four times a week I would meet the dogs while on my way to the city for breakfast. It was during the summer months. The beagle was always ahead of the big dog. If the morning was warm the latter would give up and lie down in the shade. The beagle would come back and invariably the dogs put their lips together. The beagle had some method of enticing the Saint Bernard to make another effort. One very warm morning I saw the big dog give up four times, and each time the beagle whispered something that induced him to try again. When I returned to my cabin the Saint Bernard was resting in the dooryard and the beagle was giving tongue in a nearby swamp. The rabbits often ran by the cabin in the old woods road, and the big dog, when he heard the beagle coming, would watch from behind a boulder. The rabbit loped by this morning, and the dog made a lunge, but missed and lost his footing. He remained where he fell, and when the beagle saw him he knew it was a hopeless case and did not return to the swamp.

This summer there are eight dogs that hunt in pairs about my cabin. The masters of one pair live about a mile from each other. When one of the dogs contemplates a hunt, he goes after his running mate, and together they journey to my cabin. The home of one of these dogs is in the city and the home of his mate is a mile away on a country road. When the country dog goes to the city after his mate, as he often does, he certainly must contemplate hunting and contemplate sharing the sport with his friend.

M. A. WALTON ("Hermit").

A Summer Song.

In the hush of morn in the fields of corn
I hear the Bob White calling;
At the close of day o'er the fields away
Again its cadence falling.
Bob White! Bob White!
"This is his roundelay;
Bob White! Bob White!
He's singing all the day.

Where the sunflowers bold in green and gold
Are growing, away from the city,
By the tangled hedge, in the blue stem sedge,
He ever singeth his ditty:
Bob White! Bob White!
Summer's the time to sing;
Bob White! Bob White!
List to its mellow ring.

In the prairie grass as I by him pass,
His motion and vesper together,
He sings away through the summer day
This litany for all weather:
Bob White! Bob White!
Molest me not, I pray;
Bob White! Bob White!
This is his roundelay.

In the hush of morn in the fields of corn,
You hear him far away calling,
There's a whir of wings, then again he sings,
Nearer its cadence falling:
Bob White! Bob White!
My nestlings are on the wing;
Bob White! Bob White!
Summer's the time to sing.

In Pine County Deer Woods.

ST. PAUL, Minn., August 24.—*Editor Forest and Stream*: I have never written an article for publication, but as we are all invited to give accounts of our hunts, I will just imagine that I am Charles Cristadoro for a short time, and make my first attempt.

The hunt was made last fall in the eastern part of Pine county; the party consisted of a younger and taller brother, whose camp name was Professor; another and shorter brother we called Whiskers, and the writer. We took the train for Nickerson, Nov. 7, arrived safely in the morning, and after the usual skirmish—where a team has not been engaged ahead of time—we succeeded in getting a good team and good, patient driver. Next morning we got loaded early, started on a ten-mile trip over a tote road, the terrors of which are well known to most sportsmen of the North, but which after all became a source of pleasure to the penned-up city sport. After getting well into the slashings or choppings, we found we were the first ones in that far, and on the last part of the road we had to chop the fallen trees, which were thick enough to get us well tired by the time we reached our camping spot, well along in the afternoon. It was a nice level place, well protected from the north winds and near a nice brook. After a short rest we got out our camp stove and got up a hasty lunch, with hot coffee, after which we got the driver started back. Then we proceeded to make camp, and by dark we had both tents up, bunks made, balsam boughs cut and brought inside, stove set up in one tent and principal part of baggage stored in the other tent. Then we got out our two lanterns and looked up a dry treetop which we had spotted before dark and proceeded to get a good hot supper, for we were good and hungry by that time. After supper we rested a while, and almost wished that we were users of tobacco, so that we could indulge in that seemingly enjoyable evening smoke; but we all failed to get the habit when young, although we had our trials. The last one I had was when my chums filled up an old clay pipe with fine-cut and gave it to me for an evening smoke. That was my last smoke! But as it was, we proceeded to cut the boughs and soon had our beds ready and rolled in.

The next day we cleaned up around camp, cut out a nice path to creek, got up some dry wood, cut away a few old stubs that they might not fall on our tents, and the next morning, the opening day, we were up early and started out after breakfast to explore a little and get the lay of the logging roads. The Professor went south and Whiskers and I went north up the logging road which ran by our camp. We were talking and visiting along, not expecting to see any game so very soon. But as the old saying, you always see a deer when you least expect to, we had not gone more than a hundred rods when I saw a fine large buck standing in the logging road, looking straight at us. I was in front and was an experienced hunter, and knew just what to do; but I didn't do it! I motioned to Whiskers to stop, and then took aim at a white streak going into the brush. Whiskers also blazed away, but the laugh was on me, for the old fellow bounded away unharmed. We then separated, and I struck out to try to redeem myself, and did well. In the afternoon I took a stand on a logging road, and after an hour or so a small doe started to cross about 120 yards away, and I dropped her with a broken back. This was extra fine for the first day. I skinned out the front quarters and took them into camp. Whiskers also saw another, supposed to be a doe, and wounded it, but did not get it. The Professor did not see anything. We were all glad to think we were to have fresh meat from the start. I cut out some loin chops, and you can bet they tasted good.

We spent the next two days tramping over new territory, but did not get a shot, though we saw good signs. On the 13th we had a very little snow which aided us some in tracking. We each took our own course. I struck the track of a doe and followed her for an hour or more in the afternoon, and finally saw her feeding, and had a standing shot at 100 yards and broke her back. I strung her up, tramped around, met Whiskers, and we walked together for a while. We passed up over a piece of open timber, which had been logged the winter before, and just as we were crossing a skid road or snake road a small buck jumped up and went bounding down the road. Whiskers did himself proud here by taking a quick aim and sent a ball straight through him lengthwise, and it lodged in his neck. I congratulated him and helped him dress the deer and string it up. Then we made for camp. The Professor had succeeded in getting a shot at a couple of tails in the brush, but missed the mark.

Two more days with their ups and downs and stories of the big ones that got away, then on the 16th it was all the Professor's day. He went about a mile south and took a stand on a high ridge, and after a long and patient wait a fine old 12-point buck came cautiously along in the brush at the foot of the ridge. He took aim at his side and fired. He had the fever some, and the shot struck far back, but just high enough to break his back, and the Professor was the happiest man in the woods; and well he might be, for he had the finest specimen brought out of that locality, and the mounted head adorns his parlor now.

Whiskers and I came in empty that night, but enjoyed hearing the Professor explain all about how he did it. Only a shot or two on the 17th, by Whiskers; all came in empty handed, but on the 18th Whiskers and I both landed one. Whiskers took a stand upon a creek bank, after getting some tired, and a nice two-prong buck came snuffing along on a doe's track, and

he gave him a lung shot, which soon brought him down, while I was further down the same creek.

In the afternoon, and as I was coming up over a high bank I heard some brush crack. I looked, and soon a rack of horns came into sight; then a big buck bounded into sight with a sort of bawl, like the bawl of a calf, only shorter and not very loud. He did not see me, and came straight toward me. I put my gun on him as soon as his horns came into sight, and when he got to the top of the ridge, about two rods from me, I fired. The shot struck him in the breast. He gave a slight snort, wheeled around and took his back track, ran about one hundred yards, and fell. I followed him up and soon found him dead. I sized him up a little, then started to cut a gamble, when a big buck let out a snort and went tearing out of the brush only a few yards away. I grabbed my gun and ran out into an open, and just got a glimpse of him—did not get a shot. I mistrusted then that there had been a scrap, and upon examination I found a fresh horn mark on the right ham of my buck, which was still bleeding some. He was a fine, big fat fellow; only eight points, but he weighed within ten pounds of as much as the twelve-pointer. I now proceeded to dress and string him up clear of the ground, although he weighed 50 pounds more than I did, a thing that not all hunters know how to do. It was my turn to be happy now. I had my full quota and one a big buck. The Professor visited the place where he had killed the big buck, and routed a big doe only a few rods from where the buck hung. He took a running shot at her, but missed her. We all came in tired and hungry that night. The Professor and I cut the wood, brought in the water, and Whiskers did himself proud as chief cook, and was rewarded by having his traveling expenses paid in and out.

No game on the 19th. That night a nice snow came. Next morning I went out with the Professor, and we succeeded in successfully stalking a large doe. It snowed some during the day, and in the afternoon Whiskers had a standing shot at a nice buck, but gun missed fire. 'Snow and ice had got frozen in front of the hammer. He then conversed a little with himself, and came to camp. We all told our tales, while Whiskers got supper, and sang "Eat, drink and be merry, for to-morrow we" get a buck!

The morning came, but the best he could do was to get a yearling doe. The Professor and I stalked another, and so we all came in happy, as we all had our quota. We enjoyed a good supper and spent an hour or two telling stories of the hunt. On this day I lost my bearings and had to compass my way out of the woods, causing an extra walk of several miles. Also on this day the Professor ran on to a fresh moose track, and we learned from an old camp man that a bull moose had been in that vicinity all summer, and he had seen him once.

On the 23d and 24th we packed our game into camp. We had arranged with the tote man to be there on the 25th; so by good management and four good horses we were able to get into the station late in the evening. It had turned rather warm and melted the snow mostly off, making a lot of water, and the road was bad. We had to go slow, and it was pitch dark before we got in. About three miles from the station there was a corduroy bridge over a creek with a wide, flat bottom. This bridge was about a foot under water, and you can imagine our feelings while we were going over that bridge in the pitch dark, with only the light of a lantern, and the water about 10 feet deep on each side of the bridge. It was only about four rods long, but it seemed about forty. We finally got to the station without a mishap and soon had our stuff off and into the baggage room. Then we were shown a sickening sight. Up in the corner of the room was the body of a man with his head severed clear from the body. He had become intoxicated the Sunday night before, and on his way down the track he had gone to sleep with his head resting on one of the rails, and was caught by the night train. We had to lie over a day on account of a wreck of a few miles south. We pulled out the following night. We passed the wreckage in the night, but could see it quite well by light of the train. They seemed to be paying more attention to a lot of hard coal than anything else. It was mighty scarce about that time, and they had men out with sacks gathering it up.

We got into St. Paul in the early morning, where we met the familiar face of Deputy Warden Boyd, Sam Fullerton's right-hand man, who never fails to find the game when it comes to hunting around the Union Depot. You can generally see a long steel box opener sticking out of his overcoat pocket.

We were soon at our houses, where our wives were anxiously waiting.

E. D. SPICER.

A Morning Among the English Grouse.

IMAGINE a highland glen buried in the purple and supreme silence of sunrise; an amphitheatre of mountains about it rising from the darkness of night at their feet into an upper region where the molten fires of the ascending sun burnt on their foreheads in diadems of refulgent gold. Imagine the clear metallic tinkle of a highland brook chattering softly over the pebbles by a shepherd's shelter on a hillock, and you have the surroundings of the scribe who pens this modest narrative. But it was not the splendor of coming day above, or the burn's pleasant prattle singing the heather fairies to sleep that woke him, but frying bacon!—the comforting, soul-rousing scent of rashers in the pan—that brought him from a couch that tartans and dry fern had made a bed fit for a king. And there, beyond the open door, was Rob, most faithful of attendants, turning the aforesaid rashers methodically until all of a sudden he stops with one poised upon the fork-point, and down the valley comes that magic and unmistakable sound, the crow of a cock grouse. Another and another responds from different quarters, and Rob, all aglow with interest, hurriedly spreads the little meal he has prepared just as the master appears at the hut door. When was ever food more inviting or coffee more ambrosial than under such circumstances? Already the shooter is recompensed for the waywardness which

has tempted him to sleep out on the moor for the sheer pleasure of sunrise, and a grouse or two thrown in before his companions at the Lodge are down to breakfast. As he unties the couple of setters for a preliminary canter, while the man puts the things away into the hut, he feels to the full that joy of the morning which Christopher North called a benediction, and Scrope held to be worth a year of afternoons.

And now he makes a start, beating, as a beginning, along the lower ground and gradually working up into those hills from which the wind is blowing. Don and Spot are a bit timid at first, and a duck getting up directly under their noses scares them rather badly. But they soon thaw, settling down to work beautifully until, a quarter of a mile from camp, one of them becomes interested, draws ahead a little, then suddenly becomes rigid before a heathery clump, its companion backing away on the right in a manner which brings a smile of pleasure even to the grim and weather-stained face of the old game-keeper. A few swift strides up into the quarter whence the dog has caught the tell-tale scent and six chestnut colored birds spring up with a resounding hustle and go down the valley—four of them, to be accurate, for a right and left account for two—and the gillie fervently drinks to the omens as they are retrieved.

Then on again, a fine confidence in himself and his weapon tingling in the shooter's veins, while the light pours down through the corries and the dew, that magic vintage of the morning, falls soft as lawn and condenses at the first touch of rosy light into moisture, a soft haze in the distance and a glittering garden of living jewels close at hand, a web that twinkles through the brief hour of its existence, every bead of it more beautiful than any fruit in Aladdin's garden, ripening from gray beginnings through soft lavenders and yellows to fiery crimsons when the sun is up; and each bent and sprig on the moorside trembles then as it sheds those shifting, scintillating jewels of ruddy red and purple back into the grateful bosom of their mother earth; whirr! whirr! another covey of grouse gets up from the enchanted ground, and is away unharmed round a ferny hillock in an instant.

"Perhaps ye were na thinking of grouse just then," says the old Scotchman, delicately blending reproach and excuse for an easy chance let slip, and the shooter shamefacedly has to acknowledge it was so, pulling himself together as he confesses and henceforth hardening his heart against the golden infatuation of sunrise.

After this it is good hard tramping and keen shooting. The birds lie well, being probably afraid of soiling their feathers till things are a little drier, and the experienced hand who knows a chirper from a full-grown bird when he sees it, and is not to be tempted by any stress of nerves to fire into the brown of a family party may have as good and varied shots as he can wish for under such conditions. He will not get the old cock birds, they are taking remarkably good care of themselves on the higher ground, but half a dozen brace of well-grown grouse should easily be got, and the bag may contain one or two other items to lend a pleasant variety to it. There is always a chance of a hare between the heather and the ling, and the ducks which go to inaccessible tarns when shepherds begin to move about, are thus early scattered in all sorts of unlikely places. Teal, too, who whirl round overhead with the sunlight on those wonderful green wing feathers of theirs may be chanced upon, and thus Rob may have quite as much as he can carry conveniently when the waiting dog-cart is reached on the confines of civilization. Later on the shooter may do greater things, but he has earned a glorious appetite for a second breakfast, and will not be likely to forget in the conventional success of mid-day the delights of that stolen march through the morning mists.

E. L. A.

In the West.

GAME WARDEN CARTER and his subordinates have been having lots of trouble with the unlawful chicken killers up in Holt county. Deputy Hunger made several arrests up there one day last week and had the day fixed for the offenders' preliminary hearing, but was informed that if he returned to prosecute he would be killed. The case has been deferred until the October term of court.

Sportsmen throughout Nebraska and the neighboring States of South and North Dakota, Minnesota, Iowa, Missouri, Kansas, Colorado, and Wyoming are immensely pleased with the folder the ever popular sportsmen's route, the Chicago and Northwestern, has just issued. It contains a clear and comprehensive digest of the game and fish laws of these States, together with a vast amount of desirable information anent the hunting and fishing grounds along its numerous lines and tributaries. It can be had by addressing H. C. Cheyney, the company's general agent, 1401 Farman street, Omaha.

Sam Richmond, the best known wildfowler, oarsman and guide in Nebraska, and who presides over a hunters' camp spring and fall on the legendary Platte below Clarks, writes me that he was out after plover with a couple of New York tourists last Tuesday and Wednesday, and the three guns bagged 208 birds, among which were a number of golden plover. Sam says the uplands almost exclusively confined themselves this season to the newly plowed fields, and that but little shooting was enjoyed on the big hay fields. This, of course, is accounted for by the continued damp condition of the hay and pasture lands, the rains recently being the heaviest in the history of the State. The Bartramian sandpiper is a bird that seldom alights in a wet hay or grazing field. The birds are about all gone now, and what shooting the gunners are getting is on young doves—capital sport, *en passant*.

Paul Hoagland is just back from the Red Squirrel's Nest at Lake Washington, where he made the biggest catch on big-mouth black bass that has been reported from these favorite old waters this season. Paul says that he found the fish principally on the overflowed hay and wheat fields bordering the south bay, and that he caught most of them in less than two feet of water. However, Paul inherits his angling skill from a worthy sire, and it is little wonder that he scored abundant success where others, of late, have signally failed. He is the young son of George A. Hoagland, a millionaire many times over, an inveterate hunter and fisher, and the best known sportsman in the whole West.

There is no route, wagon or rail, to the Pacific Coast

from this point that is so interesting and furnishes the attractions for the sportsman as the grand old Union Pacific. All along the route, while nature's panorama is an endless series of scenes that are both wild and beautiful, they constantly suggest to the sportsman's mind the worlds of exciting recreation and enjoyment that is to be had by a sojourn among them. While returning home from San Francisco a few days ago I saw many little pictures that awakened the most pleasing memories, made my blood flow quicker and warmed the cockles of my heart. Streaming low over the Suisun marshes I saw swarms of some species of the plover which I could not identify; a cloud of blue crane and a few geese. A few miles this side of Winnemucco, on the plain, where a long slough like a fabulous serpent twists and contorts through the verdure, our train was brought to a standstill for nearly a quarter of an hour, and while standing there we saw from the Pullman windows an old hen blue-wing teal endeavoring to entice her newly hatched brood into the water. The tiny little fuzzy balls of yellow down were grouped in a little dry hollow on the muddy bank, which sloped to an abrupt fall of perhaps two or three feet to the water, and was bordered behind with slough grass, flags and squaw cane. The mother duck was evidently in a great stew, the nearby train undoubtedly adding much to her anxiety. She would put her black bill close down to the sticky mud, and, extending and contracting her neck, utter a sort of a low, coaxing musical cluck, then turn round and trot spryly to the verge of the bank, looking back and ducking forward until she was brought to a halt just above the water's edge. But the addleheaded balls of golden fuzz, several of whom had small particles of the egg shell still clinging to their backs, showing that they had just been hatched, only huddled more compactly together and refused to budge. Again and again the old hen made the trip to and fro between them and the verge of the bank, but in vain. I was wondering whether the train's delay would be extended long enough for us to see the end of this little nature lesson when suddenly down the tortuous slough, skimming close over the tops of the sunlit tules, came the male bird, the bright sky-blue patches on his wings glancing in the amber light and his dark head bobbing searchingly from side to side, uttering as he whizzed toward us that little low, plaintive and peculiar whistle of his. When opposite the shelving shore where the old lady and her babies stood, papa blue-wing, with a quick move of his choppy wings, swerved in, and, dropping his orange legs, dove viciously, it seemed, down among the bunch of fuzzy infants, knocking them down and rolling them about him in the black loam like so many tennins!

With an indescribable squawk or cry of rage, Mrs. Teal flew at her liege lord, and with her sturdy wings knocked him back into the agglutinative soil upon his mottled back, whacking him right and left, until he finally recovered himself, and rising straight up into the air he tore off over the plain toward the distant and shadowy mountains. Then the mother, shaking herself so vigorously that a delicate little ticked feather or two were loosened from her dress, waddled quickly, with a low, soft clucking, to the nearest duckling, which was teetering uncertainly and forlornly on a clot of mud, and, seizing it in her black bill, dragged it speedily to the rim of the muddy bank and dropped it over into the water. Then she repeated this operation until the last one, and there were eleven of them, had been tossed over into the slough, and the next instant, as if they had been through the experience hundreds of times before, they were darting and criss-crossing around over the smooth surface like so many golden water bugs.

In the mountains, among the blood-painted rocks of Echo Canyon, we saw a big Coopers hawk rise from the hot sands with a three-foot black snake dangling from his talons. On the Laramie plains we saw four antelope watching the rushing train from a distant knoll, and all along through Utah and Nevada, amidst the skeleton undergrowth and sage brush, jack rabbits, coyotes and cottontails were seen scurrying away from the flying cars every hundred yards or so; over Donner's Lake, the scene of a woeful tragedy in the days of the gold fever, three huge bald eagles wound round and round in one grand aerial spiral over the lonely waters, while from a jutting peak in the Sierras we saw a splendid specimen of the golden eagle, and several more high in the air. There were ravens in the passes and magpies and butcher birds along every stream and arroyo, while always over the plains the ever-present buzzard soared. This side of the fabled Rockies, bordering the backwater from the rivers, and all the low wet places, were swarms of yellow-legs, sandpipers and killdeer, and a few miles east of Lexington, Nebraska, I saw several flocks of golden plover, while the uplands rose on long, pointed, down-curved wings from every pasture and every new plowed field. Pintail grouse and prairie chicken dotted every cut-hay field and barren stretch through the State, or sailed away on stiffened pinions from the path of the rushing train. Turtle doves scarcely ever out of sight; across the plains, from the outskirts of Omaha, over the sandhills and through the mountains, they were to be seen everywhere in pairs, fours or dozens. Across the dreary, stifling alkaline desert of Utah and the sterile waters of Nevada, it was just the same, even on the California marshes and in the shadows of the coast range, it was doves, doves, doves, from early morn till gathering twilight. How prolific they must be; what breeders, and in these little slate-colored habitants of all lands can easily be foreseen, in the ages to come, our one plentiful game bird.

Along the Truckee and the Laramie, storied streams, I saw many anglers casting for trout, and at Wadsworth we saw a party of Shoshone Indians bring in on an old dilapidated Government wagon four black-tail deer, a badger, and dozens of willow withes of rainbow and speckled trout, the most of the latter finding their way into the ice box of our diner. All through Nebraska and Colorado prairie dog towns and cities are of frequent occurrence, and in one of these, just the other side of Ogallala, we saw, grouped around the entrance to one of their subterranean palaces, thirty of forty half-grown short-eared owls, with a big, fat, rufous bellied dog, sitting erect on his haunches, in the middle of them. Such are the scenes in nature to be witnessed along the great Union Pacific every day at this time of the year.

The Yellowstone Gun Club, to the number of thirty-

seven, enjoyed an outing yesterday among friends in the vicinity of Waterloo and Elkhorn, and they made fur, fin and feather fly. In the evening Otto Spethmann wined and dined the party, while Gilbert Hopper and Dan McLain provided quarters for the night. President Hoyer says that Spethmann's spread, with its dove and upland plover pot-pie, vegetables, fruit, dessert and Yellowstone, could not have been beaten. The Yellowstone Club's fall hunting camp on the Platte will be opened September 15.

Charlie Metz returned last night from Pat Sheehan's, on Lake Shautaska, the Indian name for Lake Washington, and he reports the very best kind of bass, pickerel, pike and croppie fishing. He made a catch of thirty-two yesterday forenoon, the largest weighing a fraction over six pounds. In the lot were six or eight four-pounders. Alex. B. Rutherford and a party of Union Pacific attaches, also came down from the Red Squirrel's Nest and they report the same kind of luck.

Wilber Fawcett writes me from Webb Lake, northern Minnesota, that the bass fishing up there is very poor this season. He says the lake has been seined so systematically that it is a rare thing to get over six or eight strikes a day. Just last June a year ago Judge Ogden, Mr. Fawcett and myself put in a week at this lake, and then, I doubt, if there was another body of water in the known world that could equal it for its black bass. On a wager I boated nine in less than ten minutes, and not one of them weighed less than four pounds. But that is another story to be told at another time. But what a shame it is that such a lake could be depleted in so short a time.

The close season on prairie chicken ended in both South Dakota and Iowa on September 1, and a number of Omaha gunners, not content to await the opening of the season in their own State, have already departed for these foreign grounds. The law in Kansas opened on August 15, but the birds are not so plentiful down there this year as they usually are. In Nebraska the shooting has been wisely deferred until October 1. That there are more chicken in this State than there has been for twenty years, that is, in certain localities, cannot be disputed. The shooting, therefore, is going to be grand.

OMAHA, Nebraska

SANDY GRISWOLD.

The Preserves and the Game.

Editor Forest and Stream:

Your numerous able contributors who have written arguments and dissertations on the subject of Game Reserves of late, appear to be aligned on two sides of an issue, to wit, shall rich men be allowed to buy up large tracts of wild land, and convert them into game preserves for their own exclusive use, or shall they not be so allowed?

There have been able arguers on both sides of the issue, the preponderance in numbers being on the contra side.

The first question that presents itself for consideration in contemplating this subject, is, assuming that the consensus of public sentiment is decidedly on the contra side of the argument, how is the object to be effected? What is the practical aspect of the case? Shall a law be enacted forbidding any individual from purchasing more than a prescribed number of acres of land? Or, if there is no restriction on the extent of the purchase, shall he be excluded from the exercise of the fundamental right of property, to forbid strangers from invading his premises without his consent? Can a restrictive law be made to apply to the rich man and not to the poor man, or the man of moderate means? If so, where shall the line be drawn? Shall a man be restricted to the ownership of 100 acres, or 1,000 acres, or 100,000 acres? Or may he exercise the full rights of ownership upon a limited part of his land and only partial rights over the remainder?

The legal aspect of this problem seems to be fraught with grave practical difficulties.

But the opponents of large game preserves for private use have given no clear indication as to what agency is to be employed by way of a correction. One writer hints at the "ballot"—that means law, if anything, and involves the difficulties above suggested. The more frequent recourse alluded to, however, is the torch, which would logically lead to murder, and must embody the principle of anarchy, which is something not pleasant to contemplate as a remedy for social evils.

The controversy is simply one phase of the ancient warfare that has been going on since human history began, of the poor versus the rich.

There have been many utopian schemes for the equalizing of the good things of this world among its inhabitants, all of which, in the nature of human relations have necessarily proven to be chimerical. As long as some men are lazy, thriftless and incapable, while others are industrious, provident and efficient, so long shall we have the poor and the rich, with all the gradations between the two extremes, according to the distribution of such human qualities as go to success or failure in the struggle of life.

The only practical remedy for such inequality of possessions that has even been applied on a large scale, has been social revolution. When the poor have grown more than usually discontented, and the rich more than usually arrogant, and unmindful of the needs and desires of the less favored classes, occasionally, in the world's history, social revolutions have resulted, that have for a brief time turned society upside down and down side up; but have in all cases proved abortive in the main object, of the equalization of worldly goods and the abolition of poverty. For among the revolutionists themselves there must be inequality of mental endowments, resulting in a speedy segregation of wealth in the hands of those best equipped for acquiring and retaining it; the final effect being to substitute a new set of rich people for those who were overturned, the poor remaining pretty much as they were before.

The discontented poor have always looked with envious eyes upon the possessions of the rich. Whether these possessions be in the form of broad acres of woodland with the incidental game they contain, the envious feeling is not exceptional as compared with that pertaining to other forms of property.

But with us, in America, at this juncture, there is a difference, and the envious feeling is not confined to the proverbial poor as antipodal to the rich, nor, perhaps, is it even shared by them to any great extent; but to a different class of citizens, with sportsman's proclivities or associations, who find themselves becoming more and more restricted in a freedom they formerly enjoyed of roaming at will and pursuing game and fish over unappropriated wild lands, that have become private possession. This is no doubt a hardship that must of necessity engender resentments.

But let us look at the compensatory side of the picture.

It seems certain that, with the rapidly increasing number of people among our population who have the means, the leisure, and the inclination to hunt and fish, with the constantly improving effectiveness of the agencies of destruction, added to the peculiarly American trait of hogishness (I dislike this word, but cannot well escape it), in the destruction of everything in sight, with no thought for to-morrow, it seems certain I say, that the time is near at hand, when, unless some of it is saved by special effort, practically all the game and fish shall be destroyed, and none be left, either for the public or for private ownership.

Another closely allied subject is that of forest destruction, which is going hand in hand with game destruction, and any agencies that tend to conserve the one, shall reflect beneficially on the other. At the present rate of progress the insatiable greed of the mammon of commerce shall soon utterly denude all our remaining forest lands, and leave barren and repulsive wastes in their stead, incidentally spoiling the streams and ponds by filling them with sawmill refuse, as well as converting them into dry beds in the summer and fall, and muddy torrents in the winter and spring months.

Now, by whatever means this march of general destruction can be stayed or restricted; by whatever agencies even some of the brands can be snatched from the burning; by just so much shall the whole country be benefited.

The ideal plan for such preservation should, of course, be by the appropriation and setting part of large tracts of land by the States or the general government, to be used as game "preserves," and a limited portion of each tract applied for use as game "reserves"; the public to be admitted under wise regulations, to the pursuit of game and fish within the "preserves" and without the "reserves."

But if we are to sit down and wait upon the halting action of the State Legislatures or the United States Congress, for effective work along this line, the chances are that most of the horses shall escape before the stable is locked.

So, by whatever motives they may be actuated, whether of pure selfishness or a broad philanthropy, if certain of the wealthy class are disposed to invest their money in large holdings of forest lands, for the breeding and preservation of game, and for the maintenance of the forests, by all means the good of the whole country demands that they shall be encouraged to do so, rather than villified; for if these things are preserved from destruction now, they can easily be converted into public domain at a later period by expropriation if necessary, when the need for such measures shall have become more obvious and imperative; whereas, if they are destroyed in the meantime, even this recourse shall be lost.

In any view of it, however, the present is a mere passing phase of changes that are an inevitable accompaniment of the progressive development of our country. Heretofore, there have been large areas of unoccupied lands that were free to all, to roam upon at will, to utilize for hunting and trapping, or pasturage. This outside domain has been undergoing rapid restriction for some years past, and the time cannot be very distant when it shall all come under private ownership, except such portions as may be specifically set apart as public domain.

In the process of such restriction of privileges that had been freely enjoyed, either for commercial or recreation purposes, the distasteful changes have given rise to exacerbations, resentments and passing conflicts between parties whose interests collided; but when the novelty of the situation wore away, people have settled down into an acquiescence in the changed conditions and society has wagged along as before.

MISSISSIPPI.

COAHOMA.

In California.

Editor Forest and Stream:

A copy of the April 18, 1903, issue of FOREST AND STREAM having just fallen into my hands, I read with much interest the article entitled, "Deer in Colorado Wilds," and particularly that portion thereof which speaks of the need in the Centennial State of more and better game wardens. I don't go much on the derogatory statements made by the teamsters to En Ami as to certain deputy game wardens, for in many of the old isolated communities of Colorado the inhabitants have a habit of "back-capping" or "knocking" their neighbors, and many such statements must be taken with plenty grains of salt, but there is probably enough truth to them to warrant En Ami's conclusions that game is not as well protected in Colorado as it ought to be. The State has good enough laws, but they are not always properly administered or interpreted, and the present game warden system offers very poor protection to animals or birds. On the other hand, the law is often used to carry out petty spite or annoyances, and I am strongly inclined to the belief that the experience of Mr. Ernest Seton Thompson in Colorado was that of persecution rather than prosecution. Too often the deputy game warden is a political tool, if not a "grafter" for the money he can make out of "game hogs" or "sooners." Others think that to be a deputy warden means license to kill without respect to the law, and at the same time be immune from arrest. One fellow told me himself that he sought the position because he understood he could shoot when, what, and as much as he pleased, and no one had the power to make

him amenable to the law! I knew another that used to fill his basket at Lake San Christobal with trout below the limit of minimum length. He was a lawyer and ought to have known better. At Tywin Lakes a game warden had his fingers blown off while dynamiting fish. I knew other wardens who, before they became such, had no visible means of support, but as soon as they became wardens were quite "flush," and continued to have "money to burn" while they were in office. They seemed to have very important financial transactions with certain "high toned" restaurants and "first-class" hotels in the larger towns every once in a while.

There are conscientious wardens who will do their best to see that the laws are observed, but they cannot be everywhere, and they do not always get the co-operation, assistance, support or sympathy they should get from the citizens. And often pot-hunters, hide-hunters, and trophy-hunters are encouraged to infractions of the game laws by the very kind of citizens who should set a good example for others. A few winters ago a band of eleven deer appeared on a hill overlooking the town of Ohio City; the whole camp got the loco, and inside of two hours the entire band was slain, everybody able to get a gun taking a hand in the slaughter. It is that kind of people who make a "kick" only when others also kill at wholesale.

A mountain sheep with immense horns makes his home in the Suwatch range. His head is wanted as a trophy, and a bonus of \$300 to \$500 has been offered by certain prominent people of Leadville for it, and every unscrupulous hunter goes on a quest every once in a while for the sheep whose only crime is his beauty and magnificence. As a rule, there are three classes of people in Colorado who hold the game laws in contempt. One class, and the least harmful, are such old timers who have been in the State so long that they believe they own it, and resent the enforcement of any laws that interfere with their customs or comforts. When they want fresh meat they go and get it, law or no law, and for this class the game laws are a benefit, as it makes game more easily to get for them by preventing others from hunting for it.

Another class is the foreign population of the large mining camps, chiefly Austrians and Italians. Let these people once get a gun in their hands and they kill anything and everything in the fur and feather line that they can get within range of in or out of season. In northern Hinsdale county, once the home of deer and sheep, large game is seldom met with nowadays because of the merciless depredations of these conscienceless and game-hungry foreigners. They are exterminating the ptarmigan, erroneously called Rocky Mountain quail. These are hunted by gangs of Huns and Italians with trained dogs on the still, the birds being murdered with clubs when the dogs have pointed them and the birds are corralled by the gang.

The other pernicious class of hunters are such as the men from Chicago that En Ami speaks of. They come also from St. Louis and other large eastern cities, and are well enough to do so that they can spend weeks or months at outing in the mountains, but kill just for the love of killing, and not for the noble sport of hunting. They merely slaughter and butcher in mere wantonness, and make great inroads into the stock of game when they do find it plentiful. They seem to get pleasure only out of the numbers they kill, and not from the fun, skill, adventure and woodcraft or mountaineering involved, and appreciated by the real sportsman.

I have in my day, as have others, seen the bison so thick on the plains as to stop the railroad trains, and later, in the early 80's have seen numberless bands of antelope in the parks of Colorado. I've seen antelope and bison shot down without any attempt on the part of the shooter to get his game—the killing being done with no other purpose than to give the shooter the opportunity to say that he had killed his buffalo or pronghorn. I also saw the passenger pigeons in flocks so dense that they obscured the sun when the pigeons were on the way from the wild strawberry patches in the prairies of southern Illinois to the pea and buckwheat fields of southern Michigan. We all know these are now practically extinct.

California is finding that the game hog, game butcher, poacher, pot-hunter and all that ilk are making serious inroads into the game supply of all kinds in the Golden State. For years men were hired, at so much per diem and found, to kill off geese in the San Joaquin Valley to prevent them pulling up the young wheat. People are beginning to think it would have been better if the Commonwealth had purchased the wheat fields and let the geese had them as breeding and recruiting grounds. At any rate the press of California is waking up, and is endeavoring to rouse public opinion or attention to the peril that not only all furred and feathered game stands in, but also that which menaces even the fish. Charles F. Lummis, editor of Out West, has been throwing hot shot into the ranks of the conscienceless or thoughtless class of people who by their acts threaten our dumb friends with extinction. And another valiant and trenchant pen is being wielded by Grant Wallace through the columns of the San Francisco Bulletin. I would ask you to reproduce his most recent article in full, as it is, aside from its moral worth, a timely and very entertaining dissertation, under the heading, "Veneered Human Nature." It is as follows:

"All healthy and normal souls love the society of trees and mountains. Solitude is the mother of thought—solemn thought, divested of pettiness, dipping into the margins of the eternal; for, as Lowell has said, all thought is sad.

"What a relief to be away for a season from the crowded pavements and the marts of sordid men, where familiarity begets contempt and weariness of spirit, where all is artificial, and where men do not live, but merely exist for purposes of mutual throat-cutting, to the wilderness of crags and pines, fresh and inspiring as when spilled from the hand of the Creator, where familiarity begets only respect and tenderness!

"Forever, the highest wisdom springs from the tenderest feelings. Every great thought is fathered by a deep emotion. Your laboratory scientist, your dissector of butterflies, coldly intellectual, unemotional, may observe external facts, and tabulate and compare, and reason about the clothes his soul wears, iterating with solemn air

many an undisputed thing; but he shall never lay hold on the big, eternal truths of life until he lets emotion play under intellection, even as the flame plays under the crucible of cold minerals in his laboratory. Then the gold cometh.

"Your city man comes forth encrusted with materiality, commonly functioning brilliantly enough on the mental plane, but lacking in that close sympathy with his brother men and his brother beasts and birds and that tender interest and consideration for their lives and comfort which the quiet, observant rustic displays.

"The city for intellect, the country for genuine human feeling. The city for smug, refined hypocrisy in half the acts of life, the country for uncouth candor and unmanicured sincerity.

"For the most astounding examples of ironed and perfumed savagery, commend me to the urban product. The countryman—particularly the mountaineer, who has time for meditation—may wear clothes that do not fit him; he may mispronounce some of his words; but, as a rule, he is genuine and tender-souled and humane; and he never shoots a deer if he does not need it.

"The city either breaks or hardens the heart. It is forever the grave of innocence and wholesomeness and rest. Forever the unnatural conditions of modern city life, the development of low cunning, the mad scramble for pelf and place, make brutes of men, and encase whatever of soul there may be left in them in a crust of heartless materiality, thick, impenetrable, like the hard, bitter shell of the pinon nut that rattles down upon me from yonder pine tree. All nature is beautiful, save human nature.

"Civilization has ever developed the physical and the intellectual at the expense of the psychic, the humane and the spiritual.

"Such are a few of the reflections that crossed my mind as I lay last night, rolled in my blanket on a luxurious and fragrant bed of yellow pine needles and blossoming wild buckwheat in a gloomy rhus thicket on the lonely summit of the Sierra de la Liebre range. The sun had dabbled his bloody fingers across the horizon behind the blue frondage of sugar pines and firs on the distant Alamo, and sunk to rest an hour before.

"Range on range of sun-baked mountains, covering hundreds of square miles to the west and south, practically uninhabited save by the deer, the puma, the wildcat and the quail, had melted into hazy blue and now had merged into the general blackness.

"It was the heart of the deer country, and my duties as Government Ranger in the great forest reserve had been rendered doubly arduous for a month by the necessity of keeping a watchful eye on the bands of deer butchers from the cities, and in seeing that forest fires were not started from their camp-fires.

"These conscienceless hunters seem, many of them, to take a vicious pleasure in seeing how rapidly and completely they can pull off their veneer of urban civilization and revert to their true characters of irresponsible savages, as soon as they are out from the sight of the blue-coated policeman. Time after time, in ranging up and down the mountain streams of Ventura, Los Angeles, San Diego, and San Bernardino counties, I have found the outlets of the trout pools dammed up where these sportsmen from the city had waded in and thrown all the fish out on to the banks, in order that they might carry into camp a great catch of seventy-five to one hundred trout, and so make a record.

"It is these same gentry who boast of shooting a hundred doves a day, whether nesting or not; who slaughter mother-does and tiny milk-drinking, spotted fawns, whenever the ranger or the deputy game warden is not watching; who scatter leaden death among the mockingbirds, the orioles and the little families of half-grown quails, piping behind their mothers around the waterholes in the canyons; and whose motto is Kill—kill! No matter what it is, kill!

"And so, as I drowsed under the stars, I remembered how, a few hours before, in following the trail of a puma or California mountain lion over the Liebre, it had led me on to the recently abandoned camp of a party of four deer-slayers hard by the only waterhole in that region. I caught a glimpse of the tawny terror of the mountains as he slunk away, waving his long, black-tipped tail with quick jerks as an angry house cat does. At the same time two coyotes and a family of silver foxes scampered away into the buckthorn chaparral at my approach.

"All had been devouring fragments of venison and gnawing at the half-stripped carcasses of deer surrounding the abandoned camp.

"In all I counted portions of the carcasses of fourteen deer, large and small. Two spoiled hides lying near were clearly those of does, which it is never lawful to kill here. I am told they admitted killing twenty deer, in two weeks, by the murderous and unsportsmanlike method of lying in wait at night at the spring and shooting them down as they came to quench their thirst.

"And these sportsmen are the highest product of our urban civilization. All of these four veneered savages are professional men, two being physicians who, having broken down their own health in a mad scramble to build up the health and deplete the pocketbooks of other people, had sought retirement in the wilderness to commune with nature with repeating rifles and pump guns loaded with buckshot. Health to them spelled death to every wild thing within range.

"Yet (curious commentary on the helplessness of man), were these banal lead-slingers to be deprived of their breechloaders and be compelled to wrestle with the wilderness for an existence, they could not for a day compete with the chipmunk or the blue cottontail.

"Were we to dub such sportsmen beasts we would owe an apology to the four-footed ones, for none, save the puma and the grizzly bear when angered, will kill more than it needs. Only man kills for the mere sake of killing. Only civilized man swings the besom of annihilation. It was not the Indians who annihilated the millions of bison on our plains. It was sportsmen such as I am describing.

"Last night I was awakened at two o'clock by the blood-chilling cry of a mountain lion. A little later, from a distance came the sound of squealing, and the 'woof-woof!' of terrified pigs. On my way down the mountain this morning I passed the spot—an ancient hog corral built of chemical brush, in which possibly two dozen wild hogs had taken refuge. Here the lion had found them

in the night, and with a savage ferocity almost equaling that of the college-bred deer-butcher, he had struck dead eleven of the pigs. I found five or six others wandering about in the canyon, some with their throats or sides torn open, others with eyes scratched out; for the puma strikes with extended, rigid claws, and the results are frightful.

"And so I have found does wounded and left to die by the heartless gunners, and birds and fishes killed for the sake of killing, and thrown away.

A friend of mine, a mountaineer, had half a dozen pet does and fawns which fed with his cattle, and which he prized highly. While absent one day some city sportsmen killed them all.

"Speaking of swine, the only hogs indigenous to the mountains have bristles down their backs and travel on four cloven hoofs; but as for the city, it has a superabundance of two-legged things filled with the hog-spirit.

"All sounds are musical in the woods save the crack of a rifle. There is nothing more terrible than case-hardened Pavement-Civilization with a gun. It is not the settlers (many of whom do not kill one deer apiece per year), but the kid-glove type of hunter from the city who slaughter remorselessly, and sweep the California hills clear of every form of wild life.

"They are as senselessly destructive as the ravening kangaroo rats which carry off my spoons and pencils—objects entirely useless to them. They are the pickpockets of nature, nor have they the excuse of the wild justice of revenge, or the necessity of self-protection. Ancestral blindness wraps them up. They wear beards and eyeglasses, but morally and spiritually these profaners of nature are babes and sucklings.

"To remonstrate with such sportsmen is like feeding meat to a horse. Had they other eyes than those of corded fat and gristle they might get a far greater pleasure out of hunting the wild creatures of the wood with a camera; and they would find it would require greater patience, knowledge and acumen in stillhunting thus than in making the ground wet with the blood of fawns and orioles.

"Yet year after year these cultivated victims of the continuous calamity of bloodthirstiness are permitted to roam the woods and mountains, blind to all the real beauty about them, forever gripping a long-range gun and groping about, like the puma or the giant in the nursery tale, with his 'Fee-fo-fum,' smelling blood and prey. At this rate it is only a question of a few years when there will be left in California neither game nor songsters larger than the cicada.

"May the gods endow such Goths and Huns of the fields with a conscience, equal, at least, to that of the wolf, which kills only what it needs!"

Ah! all of the foregoing, here is an item showing to what depths of depravity or cussedness the human animal may sometimes descend to get the best of a harmless little creature:

"A so-called hunter, but one who is a disgrace to the name, set fire to a tree on the August Guillaume ranch, near Indian Springs, Friday, in an attempt to bring down a squirrel. Only timely help prevented another disastrous forest fire, as the fellow walked off, leaving the flames to spread where they might."

That happened near Grass Valley, almost on the very site where the sportsmen of Eastern California hold their annual celebrated "camp stews." Needless to say the affair has caused loud expressions of indignation.

WM. FITZMUGGINS.

SAN FRANCISCO, August, 1903.

Our Feathered Game.

UNDER this title Mr. Dwight W. Huntington has published a most interesting and useful volume of over 400 pages devoted to bird shooting, and illustrated in a copious and beautiful manner. These illustrations consist of eight full-page shooting scenes in colors, which are distributed through the book, and of twenty-nine full-page plates of photographs of mounted birds which we shoot, the number of figures being no less than 135, and including everything from the wild turkey and swan down to the least sandpiper and the bobolink. The specimens are well mounted, and the photographs for the most part exceedingly good, and enable the reader to identify each species beyond a peradventure.

The colored shooting scenes cover a variety of forms of sport—partridge, grouse, woodcock, snipe and various forms of duck shooting. All are interesting, and show much familiarity with the use of a gun in a great variety of situations.

Mr. Huntington is a sportsman of long experience. His memory goes back to the days when game was far more abundant than it is at present, and having seen the extraordinary decrease in the number of our birds, he has very clear ideas of what should be done to preserve what we have left, or even to increase it.

Mr. Huntington's work is introduced by three chapters which have to do with the present conditions of things, so far as the numbers of our birds are concerned, with guns and dogs and with game clubs, parks and preserves. He believes thoroughly in the establishment of National and State parks, wherever these can be set aside, and feels there should be refuges for game in the north and south alike. He says, "There should be parks, State and National, in Minnesota, North Dakota and Montana, to include small lakes and ponds, where the wild fowl still build their nests and where the northern grouse, the sharp-tailed and the great sagecock could be safe from persecution. There should be parks of refuge for the swans, geese and ducks adjacent to the Gulf of Mexico, where these birds might safely pass the winter.

"The wild fowl which now nest in these Northern States, in a very few years will be found there no more. The Southern refuge is equally important. The slaughter, not alone in our marshes, but on the haciendas of Mexico as well, is something beyond belief. Many of the ducks which go to winter to the armadas of Mexico, to seek the peace and quiet which precedes the slaughter, are driven from our Southern marshes by continued persecution."

Louisiana, Oregon, Washington, Northern and

Southern California, Maine, the sounds of North Carolina and the everglades of Florida, are all places where such refuges should be established. Mr. Huntington believes that the bag should be limited, as in fact is now done for many States; but it should also be limited for clubs and private associations.

Writing of a grouse preserve for the sharptail grouse, Mr. Huntington says he can imagine no better territory for this than the country from Minnesota and the valley of the Red River of the North, to eastern Oregon and Washington. "The vast number of small lakes and ponds, and the little streams and sloughs overgrown with reeds and rushes and wild rice, are full of the best ducks that fly, both the sea ducks, such as the canvasbacks and redheads, and the shoal water mallards, teal, wood duck, and all the river ducks or dabblers. Many remain in North Dakota to build their nests, and when chicken shooting I have often seen a pond full of young mallards and teal, and once made a double shot, killing a duck and a chicken, a large mallard and a swift-flying sharptail. The sharptail grouse is very similar in its habits to the prairie grouse. It struts and scratches and fights in the spring; many performing at a time on the scratching places, and as the birds bow and slip past each other with their tails up they present an amusing appearance, which has been compared to the dancing of a minuet."

The volume is divided into books, the first of which include the Gallinaceous Birds; the second the Wildfowl; the third the Shore Birds or Waders, and the fourth, the Cranes, Rails, Reed Birds and Pigeons.

To the different groups chapters are given, the length varying according to the importance of the subject. Something is told in each of the life history of the species, of its distribution, and the time when it may be shot. Thus, to the wild turkey and the imported pheasant, brief chapters are given, and much longer ones to the various grouse, beginning with the different prairie species, then treating of the ruffed grouse, dusky grouse and spruce grouse, and lastly of the ptarmigan, which really hardly falls under the observation of any sportsman.

America is well recognized as the land of the partridges, which have their greatest development in the Southwest, while the sportsmen in the Northeast know only of the Bob White, often called the typical game bird of America. Mr. Huntington enumerates and describes the chief species of these birds and the method of hunting them.

Swans, wild geese and ducks, divided into sea ducks, river ducks and mergansers, occupy 100 pages of the volume, and something is said about the pursuit of each. The author has much to say about the danger of shooting behind wildfowl, and gives numerous examples drawn from his own experience to reinforce his advice. This, in fact, is one of the charms of the volume; that it is full of bits of personal experience, which are both interesting and useful.

The Shore Birds form a long list, and while much space is given to the pursuit of woodcock and snipe, the shooting of the smaller beach birds is less full.

The last division has something to say about miscellaneous birds, and this is followed by an Appendix, giving the names and descriptions of the 135 species figured in the plates of the volumes. These descriptions are taken from standard works, and are entirely reliable.

Mr. Huntington's volume contains much natural history, and above all much information useful to the gunner, young or old. It is quite the best book on general bird shooting that we have seen for a long time.

The Maine License.

A. B. F. KINNEY, of Worcester, Mass., has partially planned a short hunting trip to Newfoundland for the last of the month, Mr. Kinney going in quest of caribou and moose in preference to deer, of which he has already killed a large number upon his previous numerous trips into the great game regions.

Mr. Kinney voices the sentiments of practically all the Worcester sportsmen when he says that a comparatively small portion of New England hunters outside of Maine men will hunt the Maine woods the coming season. "In an average year," said Mr. Kinney to a Worcester Telegram reporter yesterday afternoon, "about \$3,000,000 is carried into Maine and left there by visiting sportsmen. About \$1,000,000 of that amount comes from the fishermen, and the rest from those who are in quest of deer and moose. I venture the assertion that less than three-quarters of a million will be left there this fall and winter by the hunters of big game. The greater part of this loss falls directly upon the guides and the stores where supplies and hunters' articles are sold.

"I hear the same story on all sides. Sportsmen are going to give Maine a wide berth this fall, and hunt in Nova Scotia, Newfoundland and the Provinces instead. I have usually gone into Maine, but have no thought of troubling them there this year. I wouldn't be willing to 'baby' them enough to pay the license fee, which the State Legislature there saw fit to adopt at its last session in the very teeth of all kinds of opposition, not only from sportsmen outside of the State, but from guides and keepers of supplies who were themselves citizens of Maine. Think of the number of Worcester county men that spend a week or two, and in some cases a longer time, every fall in the Maine woods, spending their money and having a good time. From what people tell me, not more than one man in four of the old guard is going to hunt Maine, preferring to keep on to the Provinces."

Labor Day Rail Shooting.

STRATFORD, Conn., September 7.—*Editor Forest and Stream:* Hitherto the rail shooting on the Housatonic River has not been good. The birds killed are neither numerous nor in good condition, so far as I can learn. The best of the early bags was 23, and later there was one of 26. For the rest, most of the shooters got two, three, four six, and so on. A few reed birds are in the marshes, but they are protected by law and are not openly shot. At the same time, a day or two

since, I heard a man shoot eight or ten times in a piece of grass, and, later, asking his shover how many rail he had started there, was told "One." Possibly the shooter fired all those shots at a single rail, or he may have been shooting at reedies and blackbirds.

On Labor Day a large number of boats were out, but there was no shooting. Now and then half a dozen guns would be heard, and then for half an hour not a shot would be fired. Unquestionably a few birds are moving, as shown by the situation in which birds are found; and also by the reluctance with which they take to wing. However, the nights are not yet cold enough to make them come along in any number, and it is quite possible that there will be no heavy flight until toward the end of the month.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

A Picture.

SCENE—a little lake, deep set among the hills, long and narrow, fringed with lilies, the water lying level like a sheet of steel. Back and forth along the northern end plies a sharp-nosed boat, with scarce a wake. Amidships a brown-necked young college lad in bathing suit propels it, with an easy, rotary motion of the hands in alternate strokes, with barely a ripple. In the bow, both small hands on the gunwales gripping in nervous tension, a lovely girl of nineteen, her delicate color coming and going, her hair awave, her eyes aflash with excitement; and in the stern a middle-aged man whose hair in the right light shows a touch of iron gray. In his hand arches a fly-rod of split bamboo, well back over his shoulder, the quivering tip darting in irregular thrusts far astern like the lunging beak and serpentine throat of a giant crane, pointing to where the line is weaving this way and that in surging tugs. The lake grows sullen. Dark, white dimples show upon it. Gray light steals down the hills, gray mist shrouds them. There is a patter of falling drops, large ones, here and there. But the rod keeps up its lunging, the line its weaving to and fro. Slowly the bamboo straightens, a bull-necked fish sculls slowly in resentful, then with a surge and splash darts back again in rage. Still the pliant cane keeps fast its yielding urging, again the fish is guided alongside. There is no net. Nathless, there is a hand, that has been an expert frog-catcher in its day, which gently hovers ready, grips, and swings into boat with a single motion a burly three-pound pickerel, so lightly hooked in the cheek that it seems not possible the hook could have held through all that striving, granting, as it did, to the fish to keep his nose well turned away from the angle of the pulling of the line. But hold it did. And then the rain comes down in very truth—or we awake to it at last—and the boat perforce flies shoreward.

I would that I could make you see it as I saw it! For it was a lifting of the curtain to just the scene that William Black delighted in—the bare-armed, bare-legged gillie at the oars, the delicately beautiful young American girl in the bow, and in the stern—the same old, yet never old, lad in the hair of iron gray; and all in the heart of the hills, of the gray mists, on the level of that sullen lake.

J. P. T.

The Maine Whitefishes.

BY WILLIAM CONVERSE KENDALL, ASSISTANT, UNITED STATES FISH COMMISSION, IN U. S. FISH COMMISSION BULLETIN.

ABOUT forty years ago Ezekiel Holmes published a list of the fishes of Maine, chiefly compiled and containing but few fresh water species. Over thirty years later the present writer published a report upon an investigation of the fresh waters of Washington county, which contained about the first record of observations upon Maine fresh water fishes since Holmes's publication. Prior to this time there had been no systematic collecting in the inland waters of the State. In the four years immediately following some small collections were made, upon which there has been no detailed report.

In 1898 the United States Fish Commission, realizing that knowledge directly valuable to fishculture and indirectly to the public could be derived from a study of the landlocked salmon and its native habitat, detailed the author to make such an investigation of Sebago Lake basin. Since then up to the present time the fresh waters of Maine have received considerable attention and a large amount of important information has been obtained.

In ten years twenty-two salt and fresh water species not previously recorded from the State, twelve of which are fresh water forms and three of which are new to science, have been found. This raises the list of native fresh water (including anadromous) fishes from thirty-five to forty-seven species. Others have had their recorded range considerably extended in the State, and some which have not been recorded since their description, or known, perhaps, from only a single locality, have been found widely distributed. These statements are not astonishing when the great extent of the fresh waters in the State and the small amount of work done there are taken into consideration. There still remains a large unexplored area, and doubtless other forms new to the State and perhaps new to science may be discovered.

It is not the aim of this paper to enter into the details of the results of this work, this being reserved for a future more comprehensive paper, but to call attention to a few interesting fresh water species of Maine fishes and put on record some observations regarding them.

One species of whitefish has for many years been known to occur in certain Maine waters. Holmes mentions two species under the names of *Coregonus albus* and *Coregonus (Argyrosomus) clupeiformis*. The former the writer has

decided must be the species formerly recognized as *C. labradoricus*, and the other doubtfully as *C. quadrilateralis*; but they are assigned to no particular locality. In the first report of the State Fish Commission, 1867-68, Mr. Charles G. Atkins, the commissioner, says, under the heading "Whitefish (*Coregonus*)," page 25:

Of this genus we possess at least one, and probably more than one species. They occur principally in the central, northern, and northeastern portions of the State. The species found abundantly on the St. John and its tributaries has been referred to the species *C. albus*, but we doubt whether that is correct. Whether or not our whitefish is identical with the famous whitefish of the Great Lakes, it certainly partakes of that excellence which is a characteristic of all the members of this genus. In the Fish River region, in Moosehead Lake, in Schoodic Grand, they pronounce the whitefish the best of fishes. Like nearly all the salmon family, to which they belong, they spawn in the autumn, and seem to prefer running water. On the Schoodic they resort to Pocompus and Grand Lakes, where the water is flowing from three to five feet deep, and the bottom sandy and gravelly. In November each year small quantities of them are taken here with the spear. One night, Mr. B. W. French, of Calais, set a net 30 feet long at this thoroughfare, and in the morning had a barrel of whitefish. In Moosehead Lake they sometimes take the fly. In June last we saw one taken with a fly near Mount Kineo by Artemas Libby, Esq., of Augusta. It weighed 1½ pounds. Two trout weighing a pound each were taken at the same cast. They can be taken with the hook at any season of the year in deep water. Almost any bait will answer, but the best is a piece of small fish. The most of them are taken in winter. The greatest success is obtained by sinding through a hole in the ice, at the end of a line, a "cusk" thoroughly gashed with a knife. This remains there one day and tolls a great many whitefish around. They are then taken by smallest baits on small hooks. One winter many of these Moosehead Lake whitefish were sold in Augusta, and their weight was so uniformly one pound that they received the name of "pound fish," and the trouble of weighing was dispensed with by the mutual consent of seller and buyer.

The whitefish differs from most of its family in being nearly or quite destitute of teeth. Its mouth is small and tender. It has therefore none of the fierce predatory character of the trout and togue. It probably feeds mostly on small aquatic animals of various kinds, such as insects, crustaceans and mollusks, being guiltless of the death of any of its fellow fishes.

Several other annual reports of the State Fish Commission allude to these fish under the general name of "whitefish," but give no localities besides those mentioned above by Atkins and nothing further indicating more than one species.

For many years the common whitefish of Maine bore the name of *Coregonus labradoricus*, but a few years ago the well-known ichthyologist, Dr. Tarleton H. Bean, announced the identity of this species with *Coregonus clupeiformis*, or the common whitefish of the Great Lakes. Whatever changes the names may undergo, the fish remains the same for the table, unexcelled by any other fresh water fish in Maine.

During most of the year this species (the others, too, for that matter), affects the deep water of the lakes or streams. It is essentially a lake fish, but is found throughout the year in some fresh water streams, probably having strayed from its lacustrine home over falls which were barriers to its return. In the lakes early in the evening and throughout twilight these fishes often appear at the surface to feed upon insects, and their "rises" may be seen everywhere at some distance from the shore. The whitefish rarely, if ever, leaps from the water, and his "wake" is inconspicuous compared with that of the trout or most other fishes. At this time it will occasionally take an artificial fly, as also sometimes on cloudy days, but the most successful method of angling for it is that described above by Atkins.

This species is known to occur in Maine in the St. Croix waters—both east and west branches—Moosehead Lake, Debsconeg lakes, Allagash, St. Francis, and Fish rivers. It undoubtedly is a resident of nearly all, if not all, of the larger lakes of Maine. It is propagated to some extent by the State Fish Commission.

There is another whitefish found in Maine which is not so well known as the above, consequently no one disputes the right to its name of *Coregonus quadrilateralis*, or round whitefish, Menominee whitefish, frostfish, shad-waiter, pilotfish, chiven, Chateaugay shad, black-back, etc., according to the locality in which it occurs. It is found from New Brunswick westward through the Adirondacks and the Great Lakes, thence northward into Alaska. It may be distinguished from other Maine species by its more elongate, rounder body, more pointed snout, and much smaller mouth. Its habits are similar in almost every respect to the above, but it is more seldom noticed owing to its smaller size and less abundance, perhaps, and from its never being taken on a hook. It has doubtless been observed by residents of the State and its difference from the others noticed, but it has been previously recorded from but one locality in the State—Clearwater Pond, Industry.

In 1901 the writer collected this whitefish in Umsaskis Lake, October 3, and the Cross Lake thoroughfare of Eagle lakes, Aroostook county, October 23. Late in November some were also received from Mr. John Story, who collected them with the common whitefish in Square Lake thoroughfare of the same region. It is doubtless more commonly distributed in the State than recorded observations indicate.

Supported by the opinions of such eminent ichthyologists as Dr. Jordan, Dr. Everman, and Dr. Bean, and an abundance of material and data, the writer has no hesitation in describing a new whitefish from Maine, which will be designated *Coregonus stanleyi*, named for Commissioner Henry O. Stanley. It was found in abundance upon its spawning beds in the thoroughfare from Mud Lake to Cross Lake on the night of October 23, 1901. At one haul of a hundred-foot seine fully two barrels of these little fish were captured, with them being one large specimen of *C. quadrilateralis*, several small *S. sebago*, numerous common suckers (*Catostomus commersoni*), and a few *Catostomus catostomus*.

There are but two instances of the introduction of non-indigenous whitefishes into Maine waters. One was *Coregonus clupeiformis*, the other *Coregonus albula*, with either of which *Coregonus stanleyi* is unidentifiable. Regarding the former, in a letter dated April 1, 1901, Commissioner H. O. Stanley says:

Some twenty years ago the United States Commission sent me some whitefish eggs, I think from one of the lakes in Michigan. I hatched them at Rangeley and planted them in the upper lake—Rangeley. This winter they have been caught with hook and line in considerable numbers in Umbagog Lake, which is the fourth lake below. This is the only lake in which fishing through the ice is allowed. It is a pickerel lake. These whitefish were caught with a small live minnow. I have had some sent me twice this winter; they run in size from 1½ to 2 pounds. I presume they

are in the lakes just the same, and could be caught if fished for in the same way. It seems queer that they should turn up in the lower lake first, some forty miles or more away. They are surely whitefish, and none has even been seen in Rangeley waters, to my knowledge, till this year, and I have been familiar with them all my life.

The other case was a single plant, concerning which Superintendent Charles G. Atkins, of Craig Brook Station, writes that having searched the records, as well as his own memory, he finds that he has knowledge of only one introduction of such species—namely, that of *Coregonus albula*, of which an importation of eggs was hatched at Craig Brook in the spring of 1886, and all the resulting fry, estimated at 51,000, were planted in Heart Pond at East Orland, April 21 of that year.

This fish abounds in the chain of Eagle lakes, and is doubtless a conspicuous item in the menu of salmon, togue, and trout. Reports of small whitefish from other parts of the State indicate that this species may be common in other waters. It is never, or very seldom, seen, except in breeding season, but very likely could be caught with fine-meshed gill nets made of fine twine if set in deep water. It is an excellent pan fish.

Massachusetts Fish and Game.

BOSTON, September 5.—Editor Forest and Stream: Capt. Collins and his able corps of deputies are making it warm for violators of the fish and game laws. As your readers know, the use of dynamite in "fishing waters" is prohibited by a law passed last winter. At Revere Beach this week a carnival is on, and among the many outdoor attractions Prof. Oldrieve has been exploding dynamite sticks, thus producing huge "geysers" to the delight of the great crowd of onlookers. But on Wednesday two deputies appeared on the scene and forbade the use of the dynamite sticks as a violation of the law above mentioned. The managers of the show have since been trying to see the Commissioners, even following the chairman to Gloucester, whither he had gone on business, in the hope of convincing him that the surf at Revere is not included in what the law styles fishing waters. It is reported that many fish floated on the water after the explosions, but that no dead ones were found on shore. The managers have, however, desisted from further use of dynamite.

Warden Otis Thayer writes that on the approach of the "Scoter" the lobster fishermen hustle to get their shorts overboard as soon as possible. Deputies Bent and Paradis were able to convict the men arrested two weeks ago, as mentioned by your correspondent, and have also caused the arrest of still another culprit for illegal fishing in Watuppa Lake, Fall River. Several other violators of the law in various parts of the State have been successfully prosecuted, and other cases are now pending.

Evidence of the increase in the number of deer are multiplying constantly. Several persons have reported damage to crops to the Commissioners, and one of the Selectmen of West Medway has sent a statement of damages in that town to your correspondent with a request for information as to the method of securing payment for the same. I have some interesting items from Maine and New Hampshire, but will only add that reports indicate good fly-fishing for the current month.

The Mink and the Fly.

TROUT fishing in northern Michigan I find is liable to furnish a line of incidents worthy of record, queer in detail, grotesque to a degree worth remembering. Not by any means the least of the number coming under my notice during the few days spent on the Big Manistee is the one of the mink and the fly.

Mr. Harry Widdicomb, of Grand Rapids, caught a full-grown female mink on a No. 10 Cahill fly in three feet of fast-running water. The fight which followed lasted three-quarters of an hour, at the end of which time the mink was drowned, and Mr. Widdicomb was somewhat relieved. To relate Mr. Widdicomb's sensations during this struggle would be unfair to this sage of the brook. He best expresses all he felt by relating the experience of a southern Indiana judge, who brought on an engagement with a newspaper man. The judge had figured that the first blow would put that editor's paper out of business, but when the blow had been struck and the editor was still on his feet, he felt that he would rather be on his own front porch reading an account of what a scoundrel he was. The mink, too, got busy.

National Fish Culture.

(From the Boston Globe, Aug. 31.)

As ONE course along the shores of our seas, bays and rivers in these days, he cannot but notice the extent to which our "infant industries" are spreading as they pertain to fish.

We used to think that nature had filled the waters of the earth with a supply of fish for all ages and that all we had to do was to catch the store, but we now see our mistake, and find that the waters, like the land, must be replenished with animals if we would not have the stock fail us.

The great whale was the first marine animal to show signs of running out. We have not corrected the depletion yet, for the whale, being classed among the mammals, is not so easy to restore by artificial methods. Next to the whale there has been a gradual falling off of all the food fish that inhabit the seas as well as the lakes and rivers, for the fish are no exception to the universal law that constant consumption of nature's products followed by no restoration must inevitably result in depletion. To this must be added the barbarous practices of seining, and even stunning fish by concussion, which are resorted to by fishermen in order to supply the market. But exhaustion could not go on forever without an effort to counteract it.

The Government has taken hold of the matter with very commendable zeal and with gratifying success. There are now scattered along our coasts and rivers thirty-five national fish nurseries, located in twenty-five different States. The two devoted to marine species are on the New England coast. Eleven for the cultivation of river fishes, on the eastern and western seaboard, now deal with the important species of the Great Lakes, and fifteen are situated in the interior regions, devoted chiefly to the rearing of trout and bass. Besides this a large steamer is employed as a floating hatchery on the eastern rivers.

Upward of thirty different species of fish are bred at the Government stations, but a very large portion of the energy of the commission is applied to the great commercial species used as food, the cod, the salmon, the shad, the whitefish, the lake trout, the pike, the flounder, and the lobster. The total annual catch is worth \$7,000,000, and one and three-quarter billions of young are often liberated in a single season to swell the world's great fish reservoir. The number of eggs taken is almost innumerable, and every egg taken is capable of providing a healthy fish if nothing overtakes it in the process of hatching.

There is no infant industry in the world that compares with fish hatching for the size of the return. A large proportion of the eggs handled are taken from fish which have been caught for the market and would have been lost, but for the commission's efforts. In the case of the lobster, the shad, the lake trout, the pike, perch, and some other species, every egg taken, every fry hatched, represents a clear gain over nature. From 1885, when the largely increased plants of fry began to produce results, until the present time, the trend of the fisheries has been steadily upward.

Results are already apparent. Against a product of 18,000,000 pounds, worth \$995,000, in 1880, we now have an annual catch of over 50,000,000 pounds, valued at \$1,700,000. The Government is every year increasing the number and scope of its plants. Artificial clam cultivation is now being prosecuted in Rhode Island. Lucrative cod fishing is being established on grounds that had never contained cod in noteworthy numbers within the memory of the oldest inhabitant. The shad, the lobster and the trout are being multiplied everywhere and but for the barbarous methods of the seining and trapping fraternity the effect on the nation's fish supply would be more apparent than it is.

And yet the reader may ask the very natural question, If all this is so, why does the price of fish still continue to reach such sky-scraping prices? If the Government has almost unlimited power to increase the supply of fish food in the country, has it no power to curb the rapacity of the fish dealers so that the price of fish may no longer be kept within hailing distance of beefsteak? Here we fall back upon the power of the trust to hold the people by the throat. But the people will in the end prove mightier than their plunderers.

At School.

THE bees in the meadow,
And the swallows in the sky;
The cattle in the shadow
Watch the river running by,
The wheat is hardly stirring;
The heavy ox-team lags;
The dragon-fly is whirring
Through the yellow-blossomed flags.

And down beside the river,
Where the trees lean o'er the pool,
Where the shadows reach and quiver,
A boy has come to school.
His teachers are the swallows
And the river and the trees;
His lessons are the shallows
And the flowers and the bees.

He sees the fly-wave on the stream,
The otter steal along,
The red-gilled, slow, deep-sided bream,
He knows the mating-song.
The chirping green-fly on the grass
Accepts his comrade meet;
The small gray rabbits fearless pass;
The birds light at his feet.

He knows not he is learning;
He thinks nor writes a word;
But in the soul discerning
A living spring is stirred.
In after years—O, weary years!
The river's lesson, he
Will try to speak to heedless ears
In faltering minstrelsy!

—John Boyle O'Reilly.

Nov. 16.—Holmdel, N. J.—Potter Club of America's trials. C. F. Lewis, Sec'y, New York city.
Nov. 30.—Chase, City, Va.—Virginia Field Trial Association trials. Charles B. Cooke, Sec'y, Richmond, Va.

Nebraska Trials.

THE second annual field trials of the Nebraska Association, held out in Holt county, near O'Neill, recently, were undoubtedly as interesting as any trials on chicken ever held in the country. Barring the sultry intervals, the weather was most satisfactory, and many of the old dog men present said the competitions were the greatest ever held in a prairie country. They opened with the Derby, in which there were 32 starters, the largest number that was ever known in a Derby before, and in the All-Age there were 42-44 being the record in this stake. The judges were W. J. Baughn, of Ridgeville, Ind., and William Elliott, of Selma, Ia., and those present from outside the State were Nat B. Nesbitt, Chesterville, Miss.; W. D. Gilchrist, Courtland, Ala.; A. B. Caldwell, Caledonia, O.; Asher Cody, Holland, Mich.; George McLinn, Mexico, Mo.; W. W. Henry, Butler, Mo.; E. R. Sheeley, Clare, Mich.; W. J. Wilson, Sparta, Ill.; E. S. Munger, Clyde, O.; Tucker Brothers, Staunton Depot, Tenn.; J. A. Gude, Bruceville, Ind.; Edward Garr, Louisville, Ky.; W. B. Stafford, Trenton, Tenn.; Chas. Askins, Marion, Ill.; D. C. White, Courtland, Ala.; J. T. Jones, Wheeler, Miss.; James Pease, Chicago, Ill.; Dr. Hickerson, Moberly, Mo.; together with a representative of the FOREST AND STREAM and other newspaper men.

On account of the large number of entries and the high class of the dogs there was considerable dissatisfaction after the Derby, and handlers representing ten dogs in the All-Age declared they would not start, as the judges had shown partiality in their decisions. But they were all on hand the next morning, and there was not a single defection from the list. I do not believe there ever was a Derby or All-Age stake run with as many high class puppies in them.

There was \$500 in each stake; first, \$150; second, \$125; third, \$100; fourth, \$75; fifth, \$50. The Derby was run with Ossee O. against Buckle; Rodfield with Pioneer, Kate Cyrus with Dixie's Pearl; Dervish Girl with Lakefield's Pride, Phoebe Rod with Baby Ale, Keno with Topsy's Dots, Belle Oakley with Chevalier's Pride, Brett's Sport with Chesterfield's Sue, Countess Sue with Kent's Ruth, Kate Jingo with Trap, Ortez Masterpiece with Ruby Stone, Sport's Dan with Lady Mealley, Genis Oakley with Rachel Rodfield, Copper Coin with Oakley Hill's Pride, Rap's Pointer with Jingo Rock, and La Belle with Plain Rex. They were all run the first day with the following prize winners:

First—Plain Rex, English setter, owned by Thomas Griffith, Grand Forks, N. D., and handled by Nat Nesbitt. Plain Rex is by Dan Bo-ex-Thelma S., not a wonderful dog at all, but with impressive style.

Second—Lad's Meally, pointer by Lad of Jingo-ex-Margaret, W. P. Austin, Mansfield, Pa.; handled by A. B. Caldwell. Fast, stylish and steady.

Third—Brett's Sport, English setter, by Sport Count Gladstone, ex-Pride Belle; owned by William Brett, Ava, Ill.; handled by Charles Askins. Ordinary good ranger, but far from strong. His opponent, Plain Rex, a fair ranger with good pace and stylish. Decision unsatisfactory.

Fourth—Ossee O., English setter, by Count Rodstone ex-Marie's Dot; Dr. Hickerson, Moberly, Mo.; handled by Ed. Garr. Good speed, ranged well and a handsome looker.

Fifth—Divided; Chesterfield's Sue, English setter, by Jack, ex-Tigner's Vick; J. C. Tigner, Richmond, Va.; handled by W. D. Gilchrist, and Dervish Girl, English setter, by Robert Count Gladstone, ex-Fleety A., owned by the American Llewellyn Kennels, Robinson, Ill.; handled by W. W. Updike. Both good goers, Chesterfield Sue a trifle the more impressive.

All-Age Stake.

Four pairs of the All-Age were run in the afternoon, finishing just before dark; eight pairs the next morning, and the balance the next morning—a dubious piece of work. To run an All-Age stake of 42 starters and finish and announce the decisions in less than two days is hard to accomplish in August and give all the dogs a fair and equal chance and return verdicts satisfactory to all. As

they decided and ran the stake, a dog lucky enough to be put down in the cool of the day, or where the birds were plentiful and made a point or two and had class, was a sure winner. A great mistake in this stake was not calling Sir Rodney into the second series. He is a capital going dog, with plenty of class, which he showed off to an advantage in his heat with Dan Stewart. He went wide and fast, hunting his ground well, pointed twice and handled his game superbly, and was anxious for more of it when called to by the time limit. But another dog was carried in this series that did not have the class that Rodney did, and when he did have an opportunity on game went bang into them. I also think Lad of Jingo should have been taken into this series, for he is a high class dog, and was put down first brace after dinner in high cover where his work could not be viewed. But it has come to pass that a dog without style cannot win in a modern field trial, no difference how much bird sense he possesses, or how well he hunts. This high class business in a way is farcical, and should be eradicated in measuring the worth of bird dogs. Bird sense, hunting qualities, and speed should be the desiderata in determining the valuable qualities of a hunting dog, which are desirable for service, not ornamentation.

Dr. J. E. Summers, Jr., of this city, started two dogs in the All-Age stake which I know are magnificent bird dogs. They found the chicken, pointed, held, and did everything that is expected of a thorough shooting dog, but they were shy the high class the judges were looking for, and which controls the bird dog market above efficiency and genuine capacity for the field. Parties interested in the sale of dogs, or any particular strain, should never be selected to fill the important position of a judge at a field trial. Call on the intelligent, practical sportsman, the hunter and field worker, aloof from kennel influences, and you will receive justice for your dogs. High class dogs, in blood and looks, are all right, but to win my money they must do high class work afield also; then they are really high class, a class of their own. There are too many high class dogs with poor noses and little bird sense that get rank over the real thing with the modern field trial judge. A gentleman at O'Neill offered to bet \$100 that one of Dr. Summers' dogs would find more birds in a half day than any dog on the grounds in a whole day, and yet he found no takers, not even among the erudite judges.

The All-Age with Gracie's Rod and Elgin's Sport, Dod's Frank with Question, Jessie Rodfield's Ct. Gladstone with Patentee, Sport's Boy, Jr. with Repstone Jingo, Victor Okah with Abdullah Rodfield, Sank with Ortez King, Northern Huntress with Lakenfield's Rod, Jingo Jones with Alford's John, McKinley with Alpine Lad; Dan Stewart with Sir Rodney, Chief Other Day with King Dodo, Sam B. with Lad of Jingo, Prince Danstone with Jack D., Fantasma with May Fly, Hal's Pearl with Slap Dash, Prince Lyndon with Blue Danstone, Jingo's Lady with Sport's Lady, Sure Shot with Sport Webster, Jingo's Mike with Cap Jack, Boy Blue with Mascot, Pride of Rodfield with Count's Clip.

First—Prince Lyndon, English setter, by Marie's Sport, ex-West Wind, owned by John Crowley, Milwaukee; handled by E. R. Shelley. The Prince is eight years old and never started in a trial before. Good range, good speed, good nose.

Second—Alpine Lad, pointer, by Lad of Jingo, ex-Fanny Flash; owned by Charles Proctor, Union City, Ind.; handled by Garr. Fast and stylish, down thirteen times, a good one, and a former eight-time winner.

Third—McKinley, English setter, by Hickory Gladstone, ex-Thelma S., owned by Thomas Griffith, Grand Forks, N. D.; handled by Nesbitt. Very fast, admirable ranger, drops to point, good finder, steady, intelligent. A winner before on chicken.

Fourth—Dad's Frank, English setter, by Matt Ellis, ex-Belle Wilson II.; owners, Booker and Kennard, Louisville, Ky.; handled by Garr. First start, wide worker, speedy, handsome, staunch and all-round winner.

Fifth—Blue Danstone, English setter, by Count Danstone, ex-Fairland Dot; T. A. Tucker, Peoria, Ill.; handled by owner. A high class dog in all details, a winner by a tremendous margin, the very best dog that won a prize, according to my judgment.

The Nebraska trials next year will be held again during the last of August, when the card will be an All-Age stake, \$500; Derby, \$500, and a subscription stake of \$300; total, \$1,300. These trials are bound to become immensely popular, owing to the great grounds, and in 1904 I expect to see here the largest stake for dogs ever assembled in this or any other country.

SANDY GRISWOLD.

Nebraska Coursing.

OMAHA, Neb.—The Nebraska State coursing meet, which for many years has been the one big event in the annual routine of life out at Friend, will be held near the city of Kearney this fall, opening on Monday, Oct. 19, and throughout the week. The meet this autumn will be under the auspices of the Mississippi Valley Futurity Club, of which Dr. L. D. Ravencroft is president; W. D. Turner vice-president, and George Dayton secretary and treasurer. All of the preliminary arrangements, the securing of the rabbits and so forth, will be attended to by the Kearney Coursing Club. W. H. Roe, president; W. C. Chase, vice-president; N. P. Hansin, secretary, and J. S. Adair, treasurer. Nebraska jacks will be used at this meeting, and if there are any bigger, stronger or swifter on earth I'd like to know where they come from. The Montana or Nevada rabbit isn't in it. The management intend to make a big thing of this meet, and prominent coursing devotees will be here from all parts of the country.

SANDY GRISWOLD.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

SEPTEMBER.

9-11. Columbia, races for Webb cup, Chicago, Lake Michigan.
10-12. Seawanhaka Corinthian, Y. R. A. of L. I. Sound, specials. and fall regatta.
12. Keystone, open, Woodmere, L. I.
12. Beverly, seventh Corinthian, Monument Beach.
12. Bay State, Y. R. A., open, Lynn Bay.
12. Chicago, handicap race to Kenosha.
12. Columbia, fall regatta, open, Chicago, Lake Michigan.
12. Royal Canadian, Prince of Wales cup race, Toronto.
19. Chicago, special, Lake Michigan.
19. Seawanhaka Corinthian, club, Oyster Bay.
19. Larchmont, schooner cup race, Larchmont.
19. Atlantic, fall regatta, Sea Gate.
19. Bensonhurst, Y. R. A. of Gravesend Bay.
19. Manhasset Bay, Y. R. A. of L. I. Sound, fall regatta.
26. Riverside, Y. R. A. of L. I. Sound, fall regatta.
26. Seawanhaka Corinthian, club, Oyster Bay.
26. Chicago, handicap, Lake Michigan.
27. Williamsburg, open, fall regatta.

OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.
3. Columbia, special, Lake Michigan.
5. Southern, fall, New Orleans.
10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.
Second prize, \$50.00.
Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

America's Cup Races.

Third Race, Thursday, Sept. 3.

After Monday's race had been declared off, as the boats were unable to finish within the time limit and the Regatta Committee had been unable to start them at all on Tuesday and Wednesday, owing to lack of breeze, it began to look as if the matches this year would be as long drawn out as those between Columbia and Shamrock were in 1899.

Although there was very little air stirring Thursday morning, the prospects of breeze coming up later were better than on the two previous days. The preparatory gun was to be given at 12:45, but at this time it was hazy and there was very little wind. A member of the Regatta Committee on Navigator hailed Reliance and Shamrock III. and asked them if they were agreeable to a postponement. Both consented to this.

The breeze gained strength very slowly, but by noon time it had increased somewhat. Shortly after 12 o'clock Navigator anchored, establishing a line from the lightship. About this time Reliance's club topsail was taken in and her largest jackyarder was sent aloft. It was nearly 12:30 when Shamrock cast off from her tender and broke out her headsails. Reliance also cast off her tow line about this time. On Shamrock a small jib topsail was sent up and broken out.

Signals on the committee boat indicated that the boats would sail fifteen miles to windward and return, and the compass course was S. At 12:45 the preparatory gun was heard. The sea was smooth, there being very little roll on, and the tide was running ebb. Reliance had broken out a larger jib topsail than the one Shamrock was carrying.

There were very few boats on hand, the excursion fleet that was so much in evidence during the first few days had dwindled away entirely, and there were only a very few steam yachts to be seen.

The warning gun was given at 12:55, and at this time both boats were S. of the committee boat headed W. Shamrock was brought up on the wind, and then she was put on the starboard tack. Reliance also took a starboard tack. Shamrock was on her weather quarter. They were headed toward Navigator. Shamrock

was kept off, and Reliance ran out on her weather bow. With two minutes to go, Barr put Reliance on the wind again, and she passed to the S. of Navigator. Reliance and Shamrock were drawing together. After Reliance was clear of Navigator, she was headed for the line of the starboard tack. Shamrock was just off her lee quarter. Both boats stood down the line headed E. Shamrock was swung up on the wind, and then put on the port tack just before the handicap gun was fired. Reliance crossed on the starboard tack. The boats were timed at the start as follows. Reliance 1:01:56, Shamrock 1:02, the latter boat crossed three seconds after the gun, and was handicapped that time. The breeze had freshened slightly, and now had a strength of five or six knots. A little over a minute after crossing Reliance was put on the port tack and headed after Shamrock.

The skippers of each boat adopted the same policy in sailing their boats that they did on previous days. Barr pinching his boat out all he could, while Wringe gave his boat a good full and kept her footing. The crews of both boats were lined up to leeward in order to heel them down.

The wind freshened noticeably at half past one, and it cleared away the fog that had partially obscured Shamrock. On Reliance the jib topsail was taken in, as it was dragging her head off, and a smaller one was substituted. Reliance footed faster and headed higher than the challenger, and by 2 o'clock she was abeam of the English boat and a long distance to windward. The boats were getting well in toward the Jersey beach, and at 2:07:40 Shamrock, which boat was nearer shore, took the starboard tack. Reliance followed a few seconds later. Barr was sailing his boat in fine shape, and he worked every puff and change in the wind. At 2:31:30 Wringe put Shamrock back on the port tack, but it was over a minute later before Barr put Reliance about. Had the breeze held true the boats would have probably been able to make the mark after making the first long port tack, but it headed them off considerably. The wind was picking up steadily, and the jib topsail was taken in on Shamrock and another smaller one was set in its place. At one minute past three Reliance tried the starboard tack, which she held for three minutes and a half, then she was put back on the port tack again. When Reliance was again put on the starboard tack at 3:13:15, Shamrock followed. Reliance was a long distance ahead and to windward. At 3:36 Reliance was put on the port tack, and she stood for the mark, which she left on the starboard hand at 3:40:39. Her baby jib had been taken in before coming up to the mark and her balloon jib topsail had been sent up in stops. After gybing over her balloonier was broken out. The spinnaker pole was run out smartly, and the big sail was set and drawing a little over two minutes after passing the mark. Her jib and staysail were taken in and everything on deck was cleaned up. Shamrock's jib topsail was taken in five minutes before she reached the mark, and the balloonier was sent up in stops. It was 3:43:55 when Shamrock took the port tack and headed for the mark, and 3:51:46 she rounded. Her light sails were handled very smartly, and her balloonier and spinnaker were set quicker than Reliance's were.

The times over the windward leg were as follows:

	Start.	Turn.	Elapsed.
Reliance	1 01 56	3 40 39	2 38 43
Shamrock	1 02 00	3 51 46	2 49 46

Reliance had gained 11m. 3s. in the fifteen-mile beat, but as Shamrock was handicapped 3 seconds at the start, she beat her boat for boat, 11 minutes. Reliance had taken seven tacks to make the mark and Shamrock had done it in four.

Running down the wind, both the boats rolled considerably, as the sea was catching them on the starboard quarter. In order to prevent the booms from going into water, quarter lifts on both boats were set well up. Shamrock did not roll nearly so much as Reliance did, but the latter's light sails were trimmed better than the challenger's, and she opened up the gap between them steadily. At twenty minutes past four Shamrock's spinnaker was taken in, as a shift in the wind prevented it from drawing. Just at this time the fog struck in again, and it shut down thick. Shamrock was hidden entirely, and a little later Reliance was also screened from view. All the steamboats kept their whistles going, so as to give those on the yachts some idea where they were.

Navigator had anchored at the finish line, and every two minutes she sounded five short whistles. The fog-horn on Sandy Hook lightship was blowing five-second blasts at twelve-second intervals. The fleet had gathered around the finish line, and every one was peering anxiously into the fog trying to get a glimpse of one of the boats. It was half past five when Reliance shot into view out of the bank of fog. She was traveling very fast, but Barr had gone a bit to leeward of the finish line, and she was headed up sharply for the line. The balloonier was lowered so fast that the men could not secure it, and was dragging in the water when the yacht swept over the finish line. From the time Reliance burst out of the bank of fog up to the time she crossed the line, she made a picture that was most stirring and spectacular. Nothing like it had ever been seen before in yacht racing. Reliance was timed at 5:30:02, and she was lost again in the fog soon after she finished. Wringe had gotten way off his course in the fog, and half an hour after Reliance finished Shamrock was made out to the N. and E. of the finish line heading back. She was on the port tack fully half a mile off. As she never crossed the finish line, it will never be known how much Reliance beat her. The fog cleared soon after the finish. The summary follows:

	Start.	Finish.	Elapsed.	Corrected.
Reliance	1 01 56	5 30 02	4 28 04	
Shamrock	1 02 00	Did not finish.		

The fall regatta of the Manhasset Bay Y. C. will be sailed on Saturday, September 12. The date of the race has been advanced one week by arrangement with the Seawanhaka-Corinthian Y. C. The Manhasset Bay Y. C. will put down new marks for courses to replace the ones removed a few days ago.

Wellfleet Y. C.

WELLFLEET, MASS.,
Monday, Aug. 23.

The first Y. R. A. open race of the Wellfleet Y. C. was sailed off Wellfleet on Monday, Aug. 23. The breeze was so light and fluky that there was no opportunity of testing the yachts. The yachts in classes D and E were unable to finish within the time limit. The summary:

	Class D.	Corrected.
Sally VII.	3 02 20	
Chewink III.	3 03 00	
Early Dawn	Time not taken.	

	Class E.	
Opitsah V.	3 01 08	
Tayac	3 03 10	
Medric	3 03 12	
Urchin	3 05 00	

	Class I.	
Miladi II.	2 20 20	
Domino	2 25 37	
Question	2 23 52	
Wink	2 28 27	
Mirage	2 48 00	
Gertrude	2 58 44	

	Class S.	
Mildred II.	2 27 12	
Usonia	2 37 33	

	Handicap Class.	
Vim	2 49 57	
Scylor	2 54 41	
Hustler	2 56 44	
Osage	2 57 40	
Mildred	3 03 40	
Strideaway	3 16 36	

Tuesday, Aug. 24.

For the second Y. R. A. open race of the Wellfleet Y. C. there was a very heavy breeze, from E. to E. S. E. In the 25-footers Chewink III. was first across the starting line, but Sally VII. soon caught and passed her, finishing with a big lead. Opitsah had an easy win in class E, as did Miladi II. in the 18ft. knockabouts. The summary:

	Class D.	Corrected.
Sally VII.	1 15 39	
Chewink III.	1 26 25	

	Class E.	
Opitsah V.	1 23 52	
Medric	1 27 12	
Chief	1 28 55	
Urchin	1 29 35	

	Class I.	
Miladi II.	1 31 29	
Domino	1 36 32	
Gertrude	1 36 40	
Question	1 36 55	
Wink	1 38 45	

	Class S.	
Iola	1 29 48	
Mildred	1 31 47	
Usonia	1 35 46	

	Handicap Class.	
Vim	1 38 40	
Hustler	1 44 55

Medric	1 22 30	

Bensonhurst Y. C.

BENSONHURST, L. I.,
Saturday, Aug. 29.

THE sixth regatta of the Y. R. A. of Gravesend Bay was held on the afternoon of Saturday, Aug. 29, under the auspices of the Bensonhurst Y. C. It was the event postponed from July 18 because of adverse weather conditions.

At a meeting of the Association held recently, it was decided to make the last three regattas open to boats of any recognized yacht club, series prizes to be awarded on points in each class. The regular Association series for the year was continued unchanged.

A disagreeable storm from the N.E. raged all day, cutting down the entry to one of twelve boats, four of which did not finish. In the Marine and Field One-Design Class Esperance lost her centerboard. Her only opponent, Kelpie, withdrew and towed her back to a safe anchorage. During the latter part of the race the Class P boat Ogeemah lost a man overboard, which put her out of the running.

The usual Association courses were sailed. A N.E. wind gave the boats reaches to the Marine and Field, Fort Hamilton and Sea Gate marks, and a few hitches of windward work home to the start off Ulmer Park. The sea was running heavy. Most of the boats were reefed. The summary:

	Sloops—Class P—Start, 3:36.	Finish.	Elapsed.
Cockatoo, W. A. Bartow		4 56 45	1 20 45
Karma, J. C. Erskine		5 04 50	1 28 50
Folly, John A. Sutter, Jr.		5 08 45	1 32 45
Ogeemah, Brophy & Mackay		5 29 24	1 53 34
Vagabond, T. A. Vernon		Did not finish.	
Smoke, L. H. Dyer		Did not finish.	

	Sloops—Class Q—Start, 3:39.	
Cicada, A. D. O'Neil	5 14 08	1 35 08
Spots, D. D. Allerton	5 21 47	1 42 47

	Sloops—Class R—Start, 3:45.	
Sandpiper, W. W. Redfern	4 33 35	0 48 35

	Catboats—Class V—Start, 3:48.	
Rascal, D. G. Whitlock	4 32 40	0 44 40

Sandpiper and Rascal covered course once.

Esperance, T. A. Hamilton.....Disabled.

Kelpie, W. K. Brown.....Withdrew.

The winners were Cockatoo and Cicada. Rascal and Sandpiper took sailover prizes.

Duxbury Y. C.

DUXBURY, MASS.,
Thursday, Aug. 27.

The first of a series of three Y. R. A. open races of the Duxbury Y. C. was sailed on Thursday, Aug. 27, in a light, fluky air. In the 25-footers Chewink III. got the start, but Sally VII. passed her before the first mark was reached, and from this out she led. In the 22-footers Tayac had the start, but Opitsah soon went to the front and stayed there to the finish. In the 21-footers Usonia, helped by flukes, won out by nearly 12m. In the 18-footers Aspinquid got the start and first place was held by several boats throughout the race. Mirage finally went up through the bunch and won out. The summary:

Class D.		Elapsed.
Sally VII., Percival.....	2	07 00
Chewink III., Macomber.....	2	33 53
Early Dawn, J. E. Doherty.....	2	38 23
Class E.		
Opitsah V., Foster.....	2	27 10
Tayac, Joyce.....	2	30 40
Chief, S. Winsor.....	2	35 45
Medric, White.....	2	36 38
Class S.		
Usonia, A. F. Lincoln.....	2	47 25
Perhaps II., Robinson.....	2	59 05
Mildred II., S. P. Moses.....	3	11 02
18ft. Knockabouts.		
Mirage, J. Omstead.....	2	07 24
Question, H. Hunt.....	3	10 44
Miladi II., F. R. Adams.....	3	11 16
Aspinquid, C. M. Foster.....	3	42 49
Crow, M. L. Crow.....	3	21 20
Osprey, A. Train.....	3	22 05
Kittiwake II., H. M. Jones.....	3	25 29
Wink, L. B. Goodspeed.....	3	27 01
Gertrude, Lynch.....	3	31 04
Domino, C. C. Clapp.....		Withdrew.
No. 1 Handicap Class.		
Rooster, Etherington.....	2	58 47
Mildred, Coleman.....	3	07 18
Hustler, Whitmore & Robbins.....	3	07 42
Kit.....	3	09 35
Wintuxet, Potter Bros.....	3	10 30
As-You-Like-It, Whitman.....		Withdrew.
Joansett, J. C. Dawes.....		Withdrew.
No. 2 Handicap Class.		
Challenger, E. B. Atwood.....	3	06 00
Shiela, Cummings.....	3	10 30
Aureolus, H. Kellogg.....	3	13 19
Biddy.....	3	14 26
Maud.....		Did not finish.

Friday, Aug. 28.

The second race of the Duxbury Y. C. series was sailed in a fresh S. E. breeze. Sally VII. and Early Dawn were the starters in the 25-footers, and it was all Sally VII. In the 22-footers Tayac got the start and led all over the course. In the 21-footers Mildred II. won by a safe margin. The 18-footers went over the starting line in a bunch, and on the first leg of the course kept well together. On the second leg Domino went up in front and led to the finish. The summary:

Class D.		Elapsed.
Sally VII., Percival.....	1	11 13
Early Dawn, J. E. Doherty.....	1	14 11
Class E.		
Tayac, W. H. Joyce.....	2	36 26
Chief, S. Winsor.....	2	38 11
Medric, H. White.....	2	39 09
Opitsah V., S. Foster.....	2	41 39
Class S.		
Mildred II., S. P. Moses.....	2	42 03
Usonia, A. Lincoln.....	2	45 20
Perhaps, J. E. Robinson.....	2	45 26

Pokonoket, W. J. Johnson.....		Did not finish.

Saturday, Aug. 29.

The last race of the Y. R. A. open series of the Duxbury Y. C. was sailed Saturday, Aug. 29, in a fresh N. E. breeze. In the 25-footers Early Dawn was first across the starting line, but Sally VII. caught her before the first mark had been reached and opened up a good lead. Early Dawn's steering gear was broken soon after this, and Sally VII. finished it out alone. In the 22ft. class Tayac and Medric went over the line ahead of the gun and had to return. Opitsah V. led by a small margin on the first round, but on the second Chief caught and passed her, finishing in first place. There was a warm race in the 18ft. knockabouts, which was won by Miladi II., after sailing a much longer course than was necessary on account of one of the buoys being carried away. The summary:

Class D—25-footers.		Elapsed.
Sally VII., Percival.....	0	42 45
Early Dawn, J. E. Doherty.....		Disabled.
Class E.		
Chief, S. Winsor.....	1	32 09
Opitsah V., S. Foster.....	1	33 05
Medric, H. White.....	1	33 54
Tayac, W. H. Joyce.....		Disabled.
Class S.		
Usonia, A. Lincoln.....	1	43 30
Mildred II., S. P. Moses.....	1	43 40
18ft. Knockabouts.		
Miladi II., F. R. Adams.....	1	38 14
Domino, C. C. Clapp.....	1	38 32
Gertrude, H. E. Lynch.....	1	38 35
Kittiwake, H. M. Jones.....	1	39 34
Question, J. H. Hunt.....	1	40 49
Crow, Lauriat & Hooper.....	1	41 54

Osprey, A. R. Train.....	1	45 25
Mirage, J. Omstead.....	1	45 57
Aspinquid, C. M. Foster.....	1	46 02
Wink, L. B. Goodspeed.....	1	46 10
Yo San, R. J. Randolph.....		Did not finish.

Larchmont Y. C.

LARCHMONT, LONG ISLAND SOUND,

Monday, September 7.

Nearly fifty boats started in the fall regatta of the Larchmont Y. C. sailed on Labor Day.

The start was scheduled for 12 o'clock, but the Regatta Committee deemed it advisable to postpone it until one, owing to the lightness of the wind. It was a day of fickle breezes, and the racing was not conclusive. At the start the wind was N. W., then it worked around to the E., but finally a good sailing breeze came out of the S. S. E. A Government boat removed the permanent racing buoys set out by the Larchmont Y. C. a few days ago and temporary marks had to be put in place at the last moment.

The 60-footer Neola and the 43-footer Effort had no competitors in their own classes, so they raced against one another in the same class. Neola had to allow Effort a large amount of time, something over eighteen minutes, but even with this big handicap she was able to win, and with a good margin to spare.

In class M there were three starters. Anotok took another first prize, beating Spasm easily. Breeze did not finish.

Tern had a very easy time of it in the yawl class, and at the finish all her competitors were a long distance behind.

Alert added another winning flag to her long list by beating Mimosa in class N. Little Peter, the third boat to start in this class, parted her bobstay on the windward work and withdrew.

Four of the Larchmont Y. C. 21-footers came to the line. This is the first time Vaquero has appeared in the racing this season. Houri won and Vaquero was second.

In class P, Chingachook managed to win out, beating Naiad, a new boat, by over two minutes. Lucille withdrew.

The four starters in the Manhasset Bay one-design class sailed a pretty race and they were well bunched at the finish. Falcon won by 14 seconds, and Lambkin was only one second behind Bab, the second boat.

Nine boats started in the raceabout class. Maryola and Rascal had a hot race for first place, but the latter won out by 10 seconds.

In class R, Flim Flam won easily. There were four starters in the New Rochelle one-design class. Knave won and Capar was second. Deuce withdrew.

Out of three starters in class Q, Montauk was the only boat to finish. Gosling won in the Hempstead Harbor one-design class. Trilobite had no trouble beating Joke in class N. The summary:

Sloops—Class I—Start, 1:05—Course, 2½ Miles.		Finish.	Elapsed.
Neola, G. W. Pynchon.....	5	08 21	4 03 21

CABIA BLANCO.

Corinthian Y. C.

MARBLEHEAD, MASS.,
Saturday, Aug. 15.

The fourth championship race of the Corinthian Y. C. was sailed off Marblehead on Saturday, Aug. 15, in a light southeast breeze. In the 22-footers Setsu got the start, but Medric went into first place soon after, and went out so fast that Setsu withdrew. In the raceabouts, Runaway Girl got the start, but before the first mark was reached the Baggarah took the lead and held it to the finish. In the 18ft. knockabouts, Chance won an easy race. In the handicap knockabout class, Ruth finished first and Carmen took first place on corrected time, but Carmen was protested by Ruth. The summary:

22ft. Restricted Class.		Elapsed.
Medric, H. H. White.....	1	59 55
Setsu, Talbot & Lewis.....		Withdrew.
Raceabouts.		
Baggarah, R. C. Robbins.....	2	11 48
Runaway Girl, C. H. Tweed.....	2	16 18
18ft. Knockabouts.		
Chance, R. Boardman.....	1	28 24
Moslem, B. D. Barker.....	1	36 53
Rattler, A. D. Irving.....	1	39 54
Handicap Knockabouts.		Elapsed. Corrected.
*Carmen, C. H. Johnson.....	1	35 11 1 28 33
Ruth, S. H. Wheelock.....	1	33 53 1 30 05
Dabster, F. Skinner, Jr.....	1	34 29 1 33 32
Suzanne, F. Brewster.....	1	34 44 1 34 48

Saturday, August 29.

The sixth championship race of the Corinthian Y. C. was sailed off Marblehead, on Saturday, Aug. 29, in a strong N. E. breeze. Great Haste got the start in the 25-footers and led all over the course. In the 18ft. knockabouts Piccalilli was away first, but Arrow soon caught her and held first place to the finish. In the handicap class Dabster won handily. The summary:

25-ft. Class.		Elapsed.
Great Haste, T. K. Lothrop, Jr.....	1	24 12
Chewink III., F. G. Macomber, Jr.....	1	25 49
Raceabout Class.		
Baggarah, R. C. Robbins.....	1	32 03

Newport Special Thirties.

NEWPORT, R. I.,

Monday, Aug. 31.

THE 30-footers covered a 16-mile windward and return course on Monday, Aug. 31. Barbara got the start, but was passed by Carolina on the windward leg. From that time on Carolina was never headed, and won the race. The 15-footers sailed over an 8-mile course, and Eaglet won. The summary follows:

30-footers—Start, 3:33.		Finish.	Elapsed.
Carolina, P. Jones.....	6	07 07	2 34 08
Barbara, W. Rutherford.....	6	10 29	2 37 29
Raccoon, J. R. Drexel.....	6	11 49	2 38 49
Vaquero, III., P. Whitney.....	6	15 18	2 42 18
15-footers—Start, 3:38.			
Eaglet, Miss Grosvenor.....	5	14 21	1 36 21
Whisper, Master Morgan.....	5	15 06	1 37 06
Hawk, H. Lippitt.....	5	15 11	1 37 11
Minnow, W. Gammell, Jr.....	5	15 34	1 37 34

Monday, Sept. 7.

The 30-footers and the 15-footers sailed a race in a light S. wind on Monday, Sept. 7. The thirties sailed around the Compass buoy in Coddington Cove, while the 15-footers went around the bell buoy off Castle Hill. Both were windward and leeward courses.

Barbara got the start in her class, but was passed by Carolina on the windward work, and she was never headed afterward.

Eagle got the start in the 15ft. class, but was passed by both her competitors. Hawk won and Minnow finished second. The summary:

30-footers—Start, 3:45.		Finish.	Elapsed.
Carolina, Pembroke Jones.....	5	41 44	1 56 44
Barbara, Winthrop Rutherford.....	5	45 58	2 00 58
Raccoon, J. R. Drexel.....	5	49 16	2 04 16
15-footers—Start, 3:50.			
Hawk, W. Gammell, Jr.....	5	10 12	1 20 12
Minnow, H. Lippitt.....	5	13 24	1 23 24
Eaglet, Miss Grosvenor.....	5	16 31	1 26 31

Jamaica Bay Y. C.

SHAMROCK III.
Copyright by James Burton, New York City.

Canarsie Y. C.

JAMAICA BAY, L. I.,
Sunday, Aug. 30.

THE regatta given by the Carnarsie Y. C. on Sunday, Aug. 30, was open to all boats belonging to clubs enrolled in the Jamaica Bay Y. R. A. The race was sailed in a heavy N.E. wind, and there was quite a sea on. The list of starters was greatly reduced by the bad weather. The courses for all boats were the same, and the first leg was a run; the second a close reach on the port tack, the third a run, with booms to starboard; the fourth a beat to windward; the fifth a run, and the sixth a beat home. The summary follows:

Class A—Launches.		
	Start.	Finish.
Florence, A. Winkemeier	2 35 00	Not taken.
Gracie, Mr. Greene	2 35 00	Withdrew.
Class B—Sloops.		
Marion, A. E. Smith.....	2 41 30	4 39 16
Yank, Charles Dhuy.....	2 41 45	4 53 31
Lassie, Fletcher Bros.....	2 41 33	4 54 58
Class C—Cabin Cats.		
Klyo, A. Brooks.....	2 48 39	4 47 55
Ida, J. B. Acker.....	2 47 32	Not taken.
Kate, E. Hayes.....	2 46 30	5 12 10
Irene, G. Winters.....	2 49 36	4 56 15
Class D—Cabin Cats.		
Diana, H. B. Beyer.....	2 50 00	5 07 15
Burton	2 50 00	Withdrew.
Class E—Open Cats.		
Caddie, E. X. Karr.....	2 52 26	4 59 02
Meteor, W. G. Herx.....	2 52 24	Withdrew.
Aurora, A. Wirsching	2 51 34	2 02 38
Pauline B., J. H. Rogers.....	2 51 55	Withdrew.
Bill Nye, Kopf Bros.....	2 51 45	4 58 32
Class F—Open Cats.		
Vision, C. B. Fitzmaurice.....	2 55 48	5 05 09
May P., J. B. Patterson.....	2 57 40	Withdrew.
Alice, A. Bishop	2 57 42	Withdrew.
Amaranth, F. Wolff.....	2 56 20	Withdrew.
H. C. Miner, C. Werner.....	2 57 00	5 09 25

The winners were Marion, Klyo, Diana, Aurora and Vision.

Eastern Y. C.

MARBLEHEAD, MASS.,
Friday, Sept. 4.

A special open race for restricted classes of the Y. R. A. was given by the Eastern Y. C. on Friday, Sept. 4. There was a fresh S. E. breeze and a lump of a sea. Both Great Haste and Chewink III. were over the starting line ahead of Sally VII., but on the beat to windward Sally went out into the lead and held it to the finish. The Chewink was dismasted on the windward leg. The 22-footers went over the starting line bunched. Peri II. got the lead on the windward leg and held it to the finish. In the 18ft. knockabout class Question and Arrow had a warm scrap all over the course, Question winning out by 29s. The summary:

Class D—25-footers.	
	Elapsed.
Sally VII., L. F. Percival.....	1 48 45
Great Haste, T. K. Lothrop, Jr.....	1 51 07
Chewink III., F. G. Macomber, Jr.....	Disabled.

Class E.	
Peri II., Mr. Lee.....	1 57 31
Opitsah V., S. H. Foster.....	2 01 05
Tayac, W. H. Joyce.....	2 01 07
Medric, H. H. White.....	Withdrew.
Class I.	
Question, J. H. Hunt.....	1 33 26
Arrow, R. Boardman.....	1 33 55
Chance, E. A. Boardman.....	1 34 31

Myrimidon, W. C. Loring, Jr.....	1 36 26
Rattler, A. D. Irving.....	1 38 33

Saturday, Sept. 5.

The second special open race of the Eastern Y. C. series was sailed off Marblehead in fresh to strong breezes, on Saturday, Sept. 5. At the start the wind was strong from the S. E., but it shifted to N. W. later with a thunder squall. In the 25-footers Great Haste was a little ahead at the start, but Sally VII. took the lead on the windward leg and was never headed. In the 22-footers Medric got the start and led all over the course. In the 18-footers Arrow led to the windward mark, but on the last leg Moslem came down with the squall and finished first. The summary:

Class D.	
	Elapsed.
Sally VII., L. F. Percival.....	2 03 11
Great Haste, T. K. Lothrop, Jr.....	2 11 12
Early Dawn, J. H. Doherty.....	Disabled.
Class E.	
Medric, H. H. White.....	2 02 01
Opitsah V., C. H. Foster.....	2 08 03
Tayac, W. H. Joyce.....	2 11 29
Peri II., G. H. Lee.....	Time not taken.
Class I.	
Moslem, B. D. Barker.....	1 22 00
Arrow, C. A. Boardman.....	1 26 15
Question, J. H. Hunt.....	1 26 52
Myrimidon, W. C. Loring, Jr.....	1 27 46
Rattler, A. D. Irving.....	1 29 35
Chance, R. Boardman.....	1 43 20

Indian Harbor Y. C.

GREENWICH, L. I. SOUND,
Monday, Sept. 7.

On Labor Day the Indian Harbor Y. C. held handicap and sailboat races. The wind at the start was from the W., but later shifted to the E. The boats in the club handicap class covered a ten-mile course, while the club sailboats went over a five-mile course. Cymbra won in her class, Neola was second and Verona was third. Bug won out in the sailabout class. The summary:

Club Handicap.		
	Start.	Finish.
Mingo, T. L. Guild.....	3 05 00	6 08 30
Mayita, G. B. Watts, Jr.....	3 20 00	6 23 19
Dorothy, F. Remington.....	3 35 00	6 33 43
Verona, H. S. Osborne.....	3 20 00	6 03 36
Neola, E. W. Russell.....	3 35 00	6 01 19
Slipper II., Clarkson Cowle.....	3 35 00	6 24 41
Robin Hood, G. Gartland.....	3 45 00	6 18 31
Cymbra, F. C. Henderson.....	3 50 00	5 56 43
Hanley, C. Mallory.....	3 55 00	6 14 16
Indian Harbor Sailabouts.		
Stingy, E. E. Zittell.....	3 10 00	4 44 38
Bug, G. F. Dominick, Jr.....	3 10 00	4 43 39

Brooklyn Y. C.

BENSONHURST, L. I.
Saturday, Aug. 29.

THE fifth regatta under the rules of the American Power Boat Association was scheduled to occur under the auspices of the Brooklyn Y. C. on the afternoon of Saturday, Aug. 29. The heavy weather made it advisable to postpone the event to Wednesday, Sept. 2.

An interesting race, however, was held between two modern power boats of speed type, each with a reputation of having done better than 20 miles an hour. They were Adios and Standard. The course was 10½ nautical miles in extent, going from the start off Brooklyn

RELIANCE.
Copyright by James Burton, New York City.

Y. C. anchorage in Gravesend Bay, up through the Narrows to and around the bell buoy off Robbins Reef and home.

Shortly after the start, Standard, which had gotten away in the lead, had a slight mishap to her pumps and was obliged to slow up for a few minutes. This put her out of the running. Adios won by 8m. 3s. elapsed time, doing the course at better than a 21-mile clip. The summary:

Power Boats—Class II—Start, 3:35.		
	Finish.	Elapsed.
Adios, J. H. Leighton.....	4 09 17	0 34 17
Standard, E. A. Riotte.....	4 17 20	0 42 20

Adios receives 3m. 16s. time allowance for course of 10½ nautical miles. Her corrected time is 0.31.01.

New York C. C.

BENSONHURST, L. I.,
Saturday, Sept. 5.

The seventh regatta of the Y. R. A. of G. B. was held on the afternoon of Saturday, Sept. 5, under the auspices of the New York C. C. Twenty-one boats started in the event. A bad thunder squall toward the end caused seven of the craft to withdraw.

The wind at the start was E. S. E. Courses were covered in reverse order, leaving all marks to port. This gave classes M and N, which went once over the outside course, a series of reaches. The first mark was the Craven Shoal bell buoy, the second the Red Can buoy off Coney Island Point. The start was off the New York C. C. anchorage.

Classes P and under at the start of the race had a run to the Marine and Field Club mark, a reach to Fort Hamilton, windward work to the stake boat off Sea Gate and a reach home. When the squall broke the wind shifted into the W. and finally into the N. W. Most of the boats were then between the Fort Hamilton mark and the one off Sea Gate. The shift gave them a run and then a beat home. The summary:

Sloops—Class M—Start, 3:35.		
	Finish.	Elapsed.
Bobtail, E. F. Luckenbach.....	4 30 15	0 55 15
Bagheera, Hendon Chubb.....	Did not finish.	
Vivian II, S. E. Vernon.....	Did not finish.	

Sloops—Class N—Start, 3:03.		
	Finish.	Elapsed.
Adeline, J. B. O'Donohue.....	4 06 27	1 03 27
Squaw, H. J. Heath.....	5 09 17	2 06 17
Indian, H. F. Menton.....	Did not finish.	

Sloops—Class P—Start, 3:06.		
	Finish.	Elapsed.
Ogeemah, Brophy & Mackay.....	4 42 50	1 36 50
Folly, John A. Sutter, Jr.....	4 45 20	1 39 20
Karma, J. C. Erskine.....	5 11 55	2 05 55
Cockatoo, W. A. Barstow.....	Did not finish.	

Sloops—Class Q—Start, 3:09.		
	Finish.	Elapsed.
Spots, D. D. Allerton.....	4 43 45	1 34 45
Trouble, W. H. Childs.....	4 44 15	1 35 15
Cicada, A. O'Neil.....	Did not finish.	

Sloops—Class R—Start, 3:15.		
	Finish.	Elapsed.
Sandpiper, W. W. Redfern.....	5 34 30	2 19 30
Sealawag, E. S. Ludlow.....	Did not finish.

Catboats—Class V—Start, 3:18.		
	Finish.	Elapsed.
Martha M., Richard Moore.....	4 59 10	1 41 10
Rascal, D. G. Whitlock.....	4 53 15	1 40 15
Boozie, C. D. Durkee.....	5 20 05	2 02 05

Corrected time, Martha M., 1:39.18.

Marine and Field Class—Start, 3:21.		
	Finish.	Elapsed.
Esperance, T. A. Hamilton.....	4 19 54	0 58 54
Kelpie, W. K. Brown.....	4 21 45	1 00 45

The winners were: Bobtail, Adeline, Ogeemah, Spots, Sandpiper, Martha M., and Esperance.

Atlantic Y. C.

SEA GATE, L. I.,
Saturday, September 15.

The Atlantic Y. C. held a race for yachswomen on the afternoon of Saturday, Sept. 5, over the regular inside club courses in Gravesend Bay. Eleven boats started in the event. Bobtail won a special prize, offered by Com. Robert E. Tod to the boat making the best corrected time, all sailing in one class, on allowance, regardless of the launching date. She also took first honors in class M.

The helm of each boat was handled by a woman. Vagabond was looked after by Mrs. Miller, Smoke by Mrs. Eagle, Mary by Miss Hanna and Wraith by Miss Chew. The other starters were guided by the wives of the owners. The summary:

Sloops—Class M—Start, 2:05.			
	Finish.	Elapsed.	Corrected.
Bobtail, E. F. Luckenbach.....	3 19 10	1 14 10	1 12 32
Vivian II, S. E. Vernon.....	3 21 35	1 16 35	1 16 35
Bagheera, Hendon Chubb.....	3 24 00	1 19 35	1 18 27

Sloops—Class P—Start, 2:05.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

At the annual meeting of the Penataquit Corinthian Y. C., held at Bay Shore, L. I., on Aug. 20, the following officers were elected: Com., J. Adolph Mollenhauer; Vice-Com., Willard L. Candee; Rear-Com., Chas. A. O'Donoghue; Sec'y, Joseph E. Owens; Treas., Richard A. Bachia; Board of Governors: Rawson Underhill, Allan Pinkerton, Edward C. Blum, Robert W. Haff, William A. Hulse, Charles O. Grim, William Lucker, J. Campbell Smith.

The annual meeting of the Woods Holl Y. C., was held on Aug. 29, and the following were elected: Com., H. K. Dyer; Vice-Com., J. J. Veeder; Rear-Com., F. K. Gifford; Sec'y, Joseph Walsh; Treas., T. H. Howes; Meas., E. W. Bragg; Executive Committee: H. K. Dyer, E. G. Gardiner, George E. Davis, F. R. Gifford, J. J. Veeder, T. E. Howes and F. P. Robinson; Regatta Committee: H. E. Hibbard, Sam Cahoon, W. T. Harrison, H. I. Jameson and J. J. Veeder; House Committee: J. J. Veeder, L. A. Howes, W. L. Howes and F. P. Robinson.

Messrs. Tuthill & Higbie, of Greenport, L. I., have completed a new sloop for Mr. Oscar A. Webber, of New York. The yacht was named Woglinde, and she is 28ft. waterline, 44ft. over all, 11ft. breadth and 6ft. 6in. draft. She carries three tons of lead on her keel, and is planked with mahogany.

Canoeing.

American Canoe Association.

To the Members of the A. C. A.:

I wish to thank the officers, chairman and members of the various committees for their labor and efforts to make the meet at Sugar Island a success this year. The work of Mr. James K. Hand and the balance of his Regatta Committee was especially pleasing and satisfactory.

To each and every member that attended camp, I wish to extend my gratitude for their kind indulgence in overlooking many things which are apt to occur of an exasperating nature in preparing camp, etc. Also their kindness to myself and good fellowship made is most heartily appreciated.

The courtesies of the mayor and citizens of Gananoque, which were extended to the members of the A. C. A., were exceptionally cordial and pleasant.

Thanks are due to Dr. Serson and Dr. Ullman of the Church of England for conducting an inspiring service during the afternoon of the second Sunday in camp.

Just a word about the island. If nature had tried to make an island and surroundings for the special use of the A. C. A. it would have taken Sugar Island as a model, and, by the way, don't agitate changing its name, after you have once been there, you will have a sweet remembrance suggestive of its name.

Mr. Alfred Wentworth Scott, of the Camera Club, 5 West Thirty-first Street, New York City, took several official photographs of camp, camplife, members and officers. Mr. C. Fred Wolters, of Rochester, your Commodore for 1904, is the right man in the right place; he has selected Sugar Island for the annual meet of 1904. I predict a large and joyful meet under his administration.

NATHANIEL S. HYATT, Commodore.

A. C. A. Official Photographs.

Editor Forest and Stream:

Commodore Nathaniel S. Hyatt, of the A. C. A., has asked me to forward to you the following notice:

The official photographs of the Sugar Island meet of the A. C. A. may be obtained from A. W. Scott, 1123 Broadway, New York city.

A. WENTWORTH SCOTT.

CANOEING NEWS NOTES.

Mr. James K. Hand has been appointed Chairman of the Committee to revise the Constitution and By-laws of the American Canoe Association, and Mr. Robert J. Wilkin and Mr. H. L. Pollard have been appointed members of said committee to act with him.

Rifle Range and Gallery.

National Rifle Association.

THE great rifle tournament of the National Rifle Association of America, the New Jersey Rifle Association, and the United States Revolver Association, held at Sea Girt, N. J., Sept. 2 to 12, began under most auspicious conditions. There was a large attendance. This was the twelfth annual meeting of the N. R. A., the thirty-first of the N. J. R. A., and the fourth of the U. S. R. A. There was much of the competition which was open, and this, in connection with the impetus given to rifle competition in general by the recent international contests, doubtlessly contributed materially to the large attendance.

The Wimbledon cup match was open to all citizens and residents of the United States; distance 1,000yds., 20 shots, any rifle, any position without artificial rest. Entrance \$2 to members; all others, \$3. Post entry \$1 additional. First prize the Wimbledon cup, value \$500, presented by the National Rifle Association of Great Britain to the National Rifle Association of America, and to be held by the winner till the next annual meeting, when it will

be shot for again under the same conditions. There were 125 entries:

Those scoring 75 points or more were: Capt. W. H. Richards, Bloomingdale, O., 91; Pvt. S. B. Wetherald, D. C., 88; Pvt. Geo. E. Cook, D. C., 88; Pvt. E. J. Fink, D. C., 88; Lieut. W. M. Farrell, D. C., 88; Lieut. Thomas Halcombe, U. S. Marine Corps, 87; Lieut. Wm. A. Tewes, First N. J., 87; E. C. Robinson, 71st N. Y., 87; Sergt. F. X. O'Connor, 71st N. Y., 87; Lieut. K. K. V. Casey, 71st N. Y., 85; Capt. W. B. Martin, Second N. J., 85; Andrew S. Corbett, 71st N. Y., 85; Corp. C. B. Wender, O., 85; Major G. B. Young, D. C., 84; Sergt. J. H. Keough, Mass., 84; Pvt. Adam Hubschmidt, First N. J., 83; Alex. Stephens, N. Y., 83; Capt. H. M. Bell, Second N. Y., 83; Lieut. W. C. Gannon, Fourth N. J., 83; Lieut. W. W. Cookson, D. C., 83; E. A. Leopold, N. J., 83; Pvt. H. E. Evans, Ninth N. Y., 83; George W. Read, Sixth Mass., 82; Corp. W. Fay, O., 82; Sergt. George H. Doyle, 71st N. Y., 81; Lieut. F. H. Turnbull, Sixth Mass., 80; Lieut. H. L. Smith, First N. J., 80; Henry Pope, Mass., 80; Pvt. H. H. Leizear, Sixth Penna., 80; Lieut. W. B. Short, Seventh N. Y., 78; A. E. Wells, 71st N. Y., 79; Lieut. E. Y. Breese, Second N. J., 78; Capt. E. J. Flack, 71st N. Y., 77; Capt. S. S. Stebbins, 12th N. Y., 77; Capt. Robt. Byars, First N. Y., 76; Pvt. Howard Gensch, First N. J., 76; Lieut. C. S. Benedict, O., 76; F. A. Wessel, N. Y., 75; Capt. J. M. Have, Third N. J., 75; Corp. Maybee, U. S. M. Corps, 70; D. D. McTaggart, Mass., 75.

Capt. Richards' win was something of a surprise, as he was opposed by a number of renowned, seasoned veterans.

The Columbia trophy match, one of the events of the N. J. S. R. A., was won by the First Infantry of Newark. The conditions were 5 shots at 200 and 500yds.; teams of six men from each regiment, troop, battery and separate company of the National Guard, or battalion of the Naval Reserve of New Jersey. Prize, Columbia trophy and a medal to each member of the winning team:

	200yds.	500yds.	Total.
First Regiment.....	133	129	262
Second Regiment, first team.....	123	133	256
Fourth Regiment.....	126	129	255
Fifth Regiment.....	123	123	246
Second Regiment, second team.....	121	123	244
Third Regiment.....	125	118	243

The Interstate trophy, emblematic of the Interstate championship, a regimental six-man team competition, was won by the First Regiment of New Jersey. The conditions were 10 shots at 200 and 500yds. Scores: 200yds., 258; 500yds., 275; total 533. The Sixth Regiment of Massachusetts was second with a score as follows: 200yds., 261; 500yds., 272; total 533. First Regiment, D. C., third as follows: 200yds., 256; 500yds., 276; total 532.

The Inspectors' match, open to all Inspectors and ex-Inspectors of Rifle Practice, distance 500 and 600yds., 10 shots each distance, any rifle, was won by a Jerseyman, Capt. C. H. Springsted, of the Fourth New Jersey, who scored 95, one point ahead of Private H. M. Bell, of the Second New Jersey, and Pvt. H. H. Leizear, of the Sixth Pennsylvania, and Capt. Jeffords, of the Third Pennsylvania.

Trapshooting.

Fixtures.

*Sept. 9-10.—Enterprise Gun Club tournament. Geo. W. Mains, Sec'y.
Sept. 10-12.—Prescott-Arizona Sportsmen's Association tournament. W. L. Pinney, Sec'y, Phoenix.

Sept. 29-30.—Target tournament of the Shamokin, Pa., Gun Club. S. V. Vocum, Sec'y.

*Members of Western Pennsylvania Trapshooters' League. Chas. G. Grubb, Sec'y, 507 Wood street, Pittsburgh.
**Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

DRIVERS AND TWISTERS.

Mr. Howard Ridge, an eminent trap shot of Philadelphia, is prostrated with a severe illness.

At Mahanoy City, Pa., Sept. 3, Mr. Fen Cooper was high gun with a total of 142 out of a possible 150.

The Bristol, Conn., Gun Club has fixed upon Sept. 17 for its annual tournament and sheepbake. Mr. E. B. Burwell is the secretary.

We are informed that there will be a two-day shoot at targets on Oct. 9 and 10 at Olney, Ill., of which Messrs. Moore & Marks will be the managers.

We are informed by the manager, Mr. F. B. Cunningham, that the thirteenth annual tournament of the Missouri State Amateur Shooting Association will be held at St. Joseph, Mo., Oct. 8, 9 and 10.

Mr. Ira McKane has presented to the Sheephead Bay, L. I., Gun Club, an elegant silver tea set, which will be contested for on Thursday of next week. For it competition is restricted to members. This is the second valuable donation coming from Mr. McKane within a recent period. The Sheephead Bay Rod and Gun Club will add materially to the equipment and grading of their grounds in the near future at an expense of \$150.

The leaders in the prize series of shoots inaugurated by the Shamokin, Pa., Gun Club, at the conclusion of the shoot on Sept. 4, were John Jones, 82½, and W. Keiser, 79½.

We are informed by the secretary, Mr. A. H. Roberts, that the sixteenth fall tournament of the Harrisburg Shooting Association will be held at Harrisburg, Pa., on Oct. 9 and 10.

The Milton Rod and Gun Club, we are informed by the captain, Fred A. Godcharles, will hold their tournament on Sept. 21 and 22, one day earlier than advertised. This change is made to avoid conflicting with the Scranton meeting.

At Lykens, Pa., on Saturday of last week, there was a twenty-eight-man team match, 25 targets per man, between teams of Harrisburg and Lykens. Harrisburg scored 531, Lykens 498, out of a total of 700 targets. A return match in the near future is contemplated.

The North River Gun Club, of Edgewater, N. J., won the challenge cup donated by the Rockland County Industrial Fair. Last year this cup was won by the Spring Valley Gun Club. There were three club contestants for this year, North River, Spring Valley and Suffern clubs. The competition is limited to clubs of Rockland and Bergen counties.

At the Interstate Association tournament at Akron, O., Sept. 2 and 3, the high averages on the first day, shooting at 200 targets, were as follows: Professionals: Spencer 193, Hughes 189, Hawkins 187. Amateurs: Atkinson 188, Shepardson, Taylor and Daniel 187. Second day—Professionals: Spencer and Heikes, 193; Hawkins 189, Hughes 180. Amateurs: Gerlow 189, Atkinson 186, Alkire, Shafer and Barber 182.

In the Adirondacks last week Arthur Wellington Palmer died while undergoing a surgical operation for acute appendicitis. He was a member of the Crescent Athletic Club, and the Richmond Hill Golf Club. He was one of the active trapshooters of the Crescent Club. He was twenty-three years old. The funeral was from the home of his parents, 206 Clinton avenue, Brooklyn, N. Y., on Sept. 3.

At the yearly meeting of the Ossining, N. Y., Gun Club, held at the Weskera Hotel, Sept. 2, officers as follows were elected for the ensuing year: President, Franklin Brandreth; Vice-President, Dr. E. B. Sherwood; Secretary, J. Curry Barlow; Financial Secretary, Winfield Smith; Treasurer, Amos Bedell; Captain, Charles G. Blandford; Compiler of Scores, E. F. Ball; Directors: Dr. J. A. Schafmeister, Tho. Lane and W. H. Coleman.

The programme of the Shamokin, Pa., Gun Club tournament, Sept. 29 and 30, is now ready for distribution. On the first day sixteen events, alternately at 10 and 15 targets, are provided. The entrance is 50 cents, 75 cents and \$1. On the second day there are five live-bird events, two at 7 birds, \$5 entrance; two at 10 birds, \$8 entrance, and a \$1 miss-and-out. Targets 2 cents, thrown by magautrap. Send guns, etc., to Mr. A. B. Longshore. The members of the committee are Messrs. W. M. Keiser, A. B. Longshore and George Tovey. Mr. S. C. Yocum is secretary.

The Illinois State Sportsmen's Association have issued a synopsis of its forthcoming tournament, to be held at Pekin, Ill., Sept. 29, 30 and Oct. 1 and 2. The competition is amateur, excepting handicap and State events. The first three days are at targets. On the third day the main event is the Pekin Handicap, 100 targets—four events of 25 targets each—\$25 entrance; handicaps 16 to 20yds., ninety-six entries to fill; to first high gun \$1,000; second, \$150; third, \$125; fourth, \$75; fifth, \$50; and \$30 to the next twenty high guns. The fourth day is live-bird day. Write for programme to the president, A. C. Connor.

The final tournament of the Interstate Association series of 1903 will be given for the Scranton, Pa., Rod and Gun Club, Sept. 23 and 24. The programme provides ten events each day, six at 15, three at 20 and one at 25 targets; entrance based on ten cents per target. Events 5, 8 and 10 each day have respectively \$5, \$5 and \$10 added. Competition begins at 9:30. Lunch will be served on the grounds. Targets, 2 cents. The grounds will be open for practice on Sept. 22. Guns and ammunition, prepaid and marked in owner's name, shipped to W. E. Bittenbender, will be delivered on the grounds free. Class shooting. For further information address the secretary-treasurer, Mr. J. D. Mason.

The live-bird match between the past masters in the art of pigeon shooting, Messrs. A. Heritage and G. B. Eaton (Jacobstaff) took place on Outwater's grounds, near Carlstadt, N. J., on Sept. 5. A large crowd of their friends were present. The match was at 20 birds, \$25. Mr. Heritage won with a chastening lead. The scores, however, were excellent for men who are out of practice. While these two gentlemen speak of themselves as old, they are really and only in the mature stage of manhood. They are busy men who are out of practice. Twenty years ago, when Mr. Jacobstaff was relatively a mere youth, but then in better practice, FOREST AND STREAM was never called upon to record any score so low for him as the one made by him last week. Mr. Heritage should consent to a return match. We feel certain that Jacobstaff's warm blood will not permit him to tamely accept the defeat as final. The scores are published elsewhere.

The programme of the Dedication amateur tournament of the Indianapolis Gun Club, to be held at Indianapolis, Ind., Sept. 22-24, provides twelve like events at targets on each of the first two days; eight at 12 and four at 20 targets; \$1.50 and \$2 entrance. Five moneys in 20-target events; four moneys in 15-target events. Manufacturers' agents will be allowed to shoot for targets only. Amateur handicaps, 16 to 19yds. Sparrow events open to all; there are seven on the third day; one at 10, \$1, and six at 15 sparrows, \$6 entrance; four moneys. Sparrows, 10 cents. Shooting commences at 9 o'clock. Trophy to amateur making high target average. Trophy to high gun of sparrow programme. The Graphine Gun Wad Co. will give \$5 to high gun using their wadings. The English Hotel cup will be for competition by amateurs of Indiana, Ohio, Michigan, Illinois and Kentucky. The contest will be decided in three of the regular events, 50 targets each day of the first two days. The conditions are quite full and are contained in the programme. Meals and shells obtainable on the grounds. Ship shells and guns to Indianapolis Gun Club, 121 W. Washington street.

BERNARD WATERS.

WESTERN TRAP.

Garfield Gun Club.

CHICAGO, Ill., Sept. 5.—The appended scores were made on our grounds to-day on the occasion of the sixth shoot of the third series. Dr. Meek won Class A trophy on the shoot-off, after tying Pollard on 22. Thomas won Class B on 23, and Bullard won Class C on 21.

In the cup shoot, which immediately followed, Dr. Meek was again the lucky man, winning the cup on a score of 23 out of 25, thrown as 15 singles and 5 pairs. The day was a pleasant one for target shooting, except for a chilly north wind, which made the teeth chatter and noses turn blue along toward evening.

Quite a few of our regular target shooters are away after game, consequently the attendance was not up to our standard, only about twenty shooters showing up for the afternoon.

Trophy shoot:

IN NEW JERSEY.

Heritage—Eaton,

SEPT. 5.—The long pending match between Messrs. A. Heritage and G. B. Eaton, took place on Outwater's grounds near Carlstadt, N. J., on Sept. 5. The conditions were 20 birds, \$25, 28yds. rise. Mr. Geo. Piercy acted as referee. The birds were a fair lot, with some exceptionally fast, strong ones. Mr. Eaton used a 10-gauge, while Mr. Heritage used a 12-gauge gun. A large delegation from Jersey City was present. The scores:

A Heritage01220222122210111—14
G B Eaton111*0001002002220—8

Match, 10 birds, for price of birds:

North River Gun Club.

New York, Sept. 5.—The North River Gun Club, of Edgewater, N. J., at the Fair grounds at New City, Rockland county, won the challenge cup donated by the Rockland County Industrial Fair. This cup was won last year by the Spring Valley Gun Club, but the provisions are that any club must win it twice to call it their own; so this year they had to defend it against all clubs of Rockland and Bergen counties. Scores as follows, seven-man teams, 25 targets per man:

North River Gun Club 125, Spring Valley Gun Club 115, Suffern Gun Club 105.
JAS. R. MERRILL, Sec'y.

Whitney and Milner Tournament.

CONCERNING the programme of their tournament, Oct. 6 and 7, at Des Moines, Ia., Messrs. Whitney and Milner have adopted the following as their system to govern the division of the moneys:

"In order to participate in the division of moneys under our system it is necessary in a 15-bird event to break the first, second or third 5 targets consecutively. For example, supposing there were forty entries, after deducting for targets, it would leave net \$1.20 for each entry, by forty shooters, \$48 in the purse. This \$48 is divided into three parts, and \$16 placed as the purse in each of the three frames of 5 targets. To be conservative, we will say, out of the forty shooters, that twenty, or one-half of them, break their first 5 straight. This would pay 80 cents; the second frame of 5, sixteen out of the forty break straight—this would pay \$1. The third or last frame of the event, generally being the most trying to the shooter, only ten go straight. This would pay \$1.00. To the straight man through the event on this basis he would receive \$3.40."

The programme is alike for each day, twelve events—eight at 15, four at 20 targets; entrance \$1.50 and \$2. The competition is for amateurs.

High averages as follows: First, over 90 per cent., \$10; second, over 90 per cent., \$5; first under 90 per cent., \$10; second under 90 per cent., \$5; first, under 85 per cent., \$10; second, under 85 per cent., \$5; first, under 80 per cent., \$10; second, under 80 per cent., \$5.

Shooting will commence promptly at 9 o'clock. Grounds open for practice Monday afternoon. Two sets of expert traps. Ship shells care W. R. Milner, 406 Fifth street, Des Moines, Ia. They will be taken care of. Messrs. Fred C. Whitney and Will R. Milner are the managers.

A good circuit: Pekin, Ill., Sept. 29, 30, Oct. 1 and 2; Des Moines, Ia., Oct. 6-7; St. Joseph, Mo., Oct. 8, 9 and 10; two days targets, one day live birds; Omaha, Neb., Oct. 13, 14 and 15; two days targets, one day live birds.

Harrisburg—Lykens.

SEPT. 5.—One of the largest and most sociable team shoots ever held in Pennsylvania came off at Lykens, Pa., Sept. 5. Twenty-nine shooters from Harrisburg under the auspices of the Harrisburg Shooting Association went to Lykens and shot the same number of Lykens experts on invitation of ex-Senator A. F. Thompson.

The visiting team started from Harrisburg at 7:50 A. M., and arrived at Lykens a little after 12 noon. They were met at the depot by some of the Lykens shooters, headed by ex-Senator Thompson, and were escorted to the hotel, where a good dinner had been prepared for them. After dinner, to make things pleasant or otherwise, it commenced to rain. Between showers, however, some two hundred people, including the shooters, went to the shooting grounds, which are situate in the race track.

The match was shot from three traps, Sergeant system, excepting that there were only four men up instead of five, as is the usual custom. Each man shot at 25 flying targets. After each

of the twenty-nine shooters on both sides had shot at their 25 targets, it was found Harrisburg had broken 531 out of 700, and Lykens had broken 498 out of 700.

Among those present from Harrisburg were Mr. James Warden, State Game Commissioner, and Mr. A. Roberts, secretary of the Harrisburg Shooting Association; also Mr. Frank Lawrence, who acted as master of ceremonies, and greatly assisted in getting the affair finished on schedule time.

About the time the last squad were finishing, the local team prepared a sperad of fried and roasted chicken sandwiches, and hot coffee, and other refreshments, after which there were a few 10-bird events, in which most of the shooters participated.

To say that every one had a good time would be putting it mildly. The Senator and his team did everything possible to make the affair one to be remembered by the visiting team, and they succeeded.

The Harrisburg Shooting Association have already extended an invitation for a return shoot to come off in the near future. The scores:

Harrisburg Team—Henry 23, Dinger 20, Fisher 22, Hatfield 16, Seaboldt 17, Worden 19, Shoop 23, Lufz 21, Herman 22, Carlisle 21, Roberts 20, Thompson 18, Isenhauer 20, Dewalt 19, Yingst 18, Martin 18, Kepper 19, Mumane 19, Beecher 15, Stewart 18, Keener 19, Unger 20, Metzger 19, C. Keyes 20, Martzall 12, Ed Keys 13, A. Miller 13, Long 17; total 431.

Lykens Team—G. Hawk 16, A. F. Thompson 19, R. Budd 20, Alvord 14, Randall 22, C. Witnier 15, J. Shapptol 17, Martz 20, C. Hawk 22, Redding 23, Kissinger 13, Wadell 16, J. W. Witnier 16, Bright 16, George 14, Hence 13, Cox 21, J. Budd 15, Colds 13, Hoff 16, Hand 21, I. Thompson 17, Overstein 21, A. Thompson 15, Shuffler 20, Brown 24, G. Hawk, Jr., 22, Thompson 17; total 498.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Sept. 3.—The regular monthly shoot of this club to-day was well attended, there being two cups to shoot for, and a match with the Millbrook team accounts for the good attendance. Besides these three events, a number of 10-bird sweeps were shot off. The shooting throughout the programme was very good. Capt. Traver and G. Stevenson, of the Millbrook club, were the stars of the day. Each of these gentlemen were in splendid form, and succeeded in breaking 25 straight. Had it not been for the miserable and disgusting way in which the magautrap worked we could say that this was one of the pleasantest little shoots ever held on these grounds. To see a number of men shooting that are capable of making good—perhaps straight—scores have their chances spoiled by a balky trap is a condition that mars the pleasure and tries the patience of all present. This case was an extreme. It is probable that another system of trapping targets will be installed unless the old trap can be made more satisfactory in the future than it has been in the past.

Event No. 9, for the club cup, was won by Capt. Traver, with a straight score. In event 10, for the Marshall cup, Traver was tied by Smith, who had a handicap of 1. In the shoot-off, event 11, Smith scored 22 and won out. Mr. Tompkins shot along.

Lyons Gun Club.

LYONS, Neb., Aug. 31.—The appended scores were made at the regular prize shoot of the Lyons Gun Club, Aug. 29. Owing to the threatening weather, the attendance was light. The visiting shooters were J. Shamberg and B. Latta, of Tekamah, and Severson. Thimke and Nathan Zucker, of Wisner.

Haner and Praisewater tied for high average for the day with 89 out of 100. The scores:

Events:	1	2	3	4	5	6	7	Shot

J. M. PRAISEWATER, Sec'y.

Winchester Gun Club.

WINCHESTER, N. H., Sept. 4.—The Winchester Rod and Gun Club will hold a tournament, Sept. 24, open to all.

The Peters Cartridge Co. have given to the State trapshooters a very fine cup, to be the championship cup of New Hampshire; to be shot for at this tournament. Following are the rules to compete for it:

The first contest for the championship cup of New Hampshire will be held on the grounds of the Winchester, N. H., Gun Club, Sept. 24, the winner to hold it subject to challenge. The match to be shot within two weeks from date of challenge. Each match at 100 clay targets, thrown from magautrap or expert traps, under Interstate Association rules.

The cup to become the personal property of the winner of six shoots. Entrance fee to be price of targets, and each match shall be open to any legal resident of the State, in addition to holder and challenger.

Guns shipped to L. R. Nelson, will be cared for and delivered on grounds,
L. R. NELSON.

Interstate Tournament at Akron.

AKRON, O., Sept. 4.—The tenth tournament of the Interstate Association series for the season of 1903 was held at Akron, O., Sept. 2 and 3, under the auspices of the Akron Gun Club, and it was a success in every sense of the word, over eighty different contestants taking part in one or more events.

The Akron Gun Club is a strictly up-to-date organization, and it has beautiful grounds located on North Hill just beyond the city limits. The grounds, which comprise some eight acres, are owned by the club in fee simple, and are equipped with three sets of traps, Sergeant system, a commodious club house and every necessary accessory. The cashier's office is a model which other gun clubs would do well to pattern by. It is arranged after the style of the counting room of a bank, with ample room for all clerks working therein. Most gun clubs are satisfied with a small coop affair, where there is hardly room to turn around in, yet the cashier's office is the mainspring of a tournament.

The opening day of the tournament was an ideal one, which brought forth seventy-five contestants and a large crowd of spectators. The contestants generally were loud in their praises of the grounds and equipment, saying that they are surpassed by but few gun clubs in the country. This praise, coming as it does from men who have shot in every city in the land that possesses a gun club, was very pleasing to the officers and members of the Akron Gun Club who worked so hard to make the organization a success, and augurs well for the satisfactory management of the Ohio State tournament next June.

The trade was represented by Messrs. Heikes, Hughes, Fanning, Driehs, Phellis, Spencer, Hawkins, North, and Gross. Among these manufacturers' agents, Spencer was high man for the day, breaking 193 out of 200 shot at. Hughes was next with 189, Hawkins third with 187.

Among the amateurs Atkinson was high man with 188, closely followed by Shepardson, Taylor and Daniel with 187. Raven was third with 186 to his credit.

The second day was also an ideal one for shooting purposes, and fifty-five contestants were on hand during the day. The programme was started promptly at 9 o'clock, and was finished by 3:30.

Spencer and Heikes tied for first place among the manufacturers' agents, with a score of 193. Hawkins was second with 189, and Hughes third with 180. Among the amateurs Gerlow was first with 189, Atkinson second with 186, and Alkire, Shafer and Barber were third with 182.

The scores of both days follow:

Sept. 2, First Day.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot

ACCIDENTS WHICH ARE NOT ACCIDENTS.

YEAR by year for many years past the number of people killed and maimed by careless hunters, so-called, has steadily increased in the States which possess sections containing big game. Exceptional, indeed, is the big-game district which has not its gruesome record of people maimed or killed by the armed civilized savage whose gluttony for blood inspired him to shoot first whether the subject shot at was distinguishable or not, and then to determine afterward whether it was man, deer, horse, or cow.

In the aggregate the list of gratuitous tragedies resulting from wanton killings is appalling. In nearly every instance the explanatory phase of the killing is that the killer mistook the killed for a deer. Moreover, the deceased is by implication not infrequently accused of contributory negligence, if indeed he be not an accessory, because of wearing a cap or coat which in some remote or forced manner, resembled the form or color of a deer. A plea more absurd or more irrelevant in its substance, or more exasperating in its sombre flippancy, can not well be imagined. In a way such plea is self-incriminatory; or if the killer, when in the deer country, armed and in killing bent, is incapable in the matter of distinguishing man from deer, then he is morally criminal in attempting to hunt deer at all.

No man, when life or death is involved, can reasonably or justifiably mistake a man for a deer. The plea is an absurdity on its face. The fact is that, concerning the deer-and-man plea, the hunter shoots without determining definitely what object he is shooting at. It is all done in presumption.

The presumption is that, in the woods, the surroundings all being suggestive of the presence of deer and the absence of man, it is safe to shoot. Undoubtedly the deer hunter has deer in his mind as a presumption. Undoubtedly there is a wide difference between his idea and the matter of fact. Shooting as a matter of idea and shooting as a matter of fact also are prone to result in wide differences.

Notwithstanding the fatalities of the years resulting from the criminal carelessness in the use of rifles in the big-game sections, they seem to have carried no admonitory lesson.

The present open season, recently begun, has already an enactment of the old tragedy. In all its details it is a repetition of the details which distinguish similar happenings of the past. As recounted by the daily press, the happening took place at Moose Pond, N. Y., in the North Woods, on September 9. Joseph Buprey, of Washington, D. C., and his guide, Frederic Barbour, were hunting deer by moonlight. Buprey was stationed on the shore of the pond by a trail used by the deer when going in and fro. His guide and another young man paddled around the pond in a canoe seeking deer. As they approached Buprey's stand, the splashing of the paddle attracted his attention. He fired and shot Barbour in the breast two inches below the heart. The bullet passed between the shoulder blades. The deceased left a widow and five small children. Buprey mistook the guide for a deer.

The foregoing act, if the recountal be true, bears all the marks of criminal carelessness. No doubt the offender is profoundly grief-stricken; no doubt he deeply regrets the rash shot which enacted a tragedy. But stripped of its sentimentality, there is not a circumstance to condemn the rashness of it. By it a human life was lost, a woman was widowed, a family of children were orphaned, and the State lost a citizen. If it were an isolated happening it might be passed over more lightly, but in view of the past killings incident to the open season, it may be viewed as the beginning of the death toll for 1903, if drastic public opinion or statute law does not enforce some check.

Nor are deer the only creatures which in the woods are stalked for men. The daily press of Lancaster, S. C., counts that on September 10 a squirrel hunter, accompanied by his son and grandson, eight years old, were squirrel hunting in Chester county. The party became separated. The man fired at what he supposed was a squirrel in the bushes, and, approaching the object, he and his grandson expiring in death agonies.

The daily press recently made mention of the death of a young Ernest, 16 years old, of Queen's Borough, L. I., killed by a Flobert rifle which failed to fire. Young

Ernest peered into the barrel to learn the cause of the misfire. The rifle discharged its load into the young man's eye and killed him.

September 7, at Bellmore, L. I., Louis Grimm, of Brooklyn, attempted to place his gun in the bow of the boat butt first. The hammer caught, the gun fired, and Grimm's wrist was broken and his breast lacerated. He was taken to a hospital.

All of which repeats and emphasizes the moral that men who are incompetent to handle firearms properly should not be permitted to use them.

THE ADIRONDACK ELK.

THERE could hardly be a more impressive commentary on the discussion concerning game preserves in *FOREST AND STREAM* than a recent happening in the Adirondacks.

Last year the Brown's Tract Guides' Association turned out in the Adirondacks a herd of five elk, in the hope that these animals would increase, and that through them the Adirondacks might be restocked with this great game. The elk did well and became very tame, and during the winter, spring, and summer have been frequently seen, but on Sunday, September 6, one of them was killed by a locomotive near Clearwater, and on Tuesday the bull and two cows were found dead at First Lake, North Branch, near the Bald Mountain House. Thus but a single elk is left, and the attempt is a failure.

A few years since, as will be remembered, an elk that had been turned out into the free woods of the Adirondacks was killed. It was variously reported that the man who shot it took it for a deer, or that he supposed it was a domestic cow. Whatever may have passed through his mind, he killed the elk.

This is what is likely to happen whenever attempts are made to stock with new game sections where people have liberty to shoot or hunt. Human nature being what it is, there will always be individuals uncontrolled and uncontrollable, who will consider their own desires and follow their own impulses before thinking of others and their duty to their fellow men. Laws are not made to control the worthy, the conscientious, and the thoughtful, but the thoughtless, the inconsiderate, and the criminal. Among those who use the rifle, the shotgun or the rod, there are those who—if they could safely do so—would kill off the buffalo in a city's park, and the manatee and the great trout in the New York Aquarium.

This does not mean, necessarily, that such persons are criminal; they are merely intensely selfish, and to be able to say that they have killed an elk or a buffalo means more to them than to think that the people who visit the Bronx or the Adirondacks twenty years hence will have an opportunity to see many of these animals. Like the small boy who shies a stone at a bird's nest, they take no thought of the consequences which may follow the act.

The so-called "sportsmen," that is to say, the men and boys who carry firearms into the woods, are by no means the only offenders in this respect. Often the spirit among the men they employ—that is to say, the guides—is as bad as can be. We knew lately of a party of boys under twenty in the Adirondacks who were paddled up to deer in summer and urged by the guide to shoot the game. As one of the boys put it, the guide seemed to be really angry because he would not shoot the deer; but the young fellow had pluck enough to persist in his refusal. This showed remarkable character, for to resist the persuasion and half-veiled contempt of an older man, who is besides a woodsman, shows unusual strength of character. Not many boys have pluck enough to take so fine a stand. More often a boy is only too ready to join the guide in destroying game out of season, and subsequently he and his father and mother may boast of it, with bated breath, as a creditable achievement. A case of this kind occurring this summer in Maine, where the law is supposed to be properly enforced, recently came to our knowledge.

If, as all our correspondents agree, New York State should itself have a game preserve in the Adirondacks, this must be a real preserve, and that means an absolute game refuge, where no hunting shall be permitted, where even guns may not be carried unless they are sealed. Some woods visitors might be trusted to carry weapons through a preserve, but persons so to be trusted are not very numerous among the rich, the poor, the ignorant, or

the learned. Most of us need a good strong law and a game warden within earshot. The difficulty of detecting violators of the law makes a sufficient reason for the absolute prohibition of the carrying arms within any refuge which is to be of any practical use. In the recent case in the Adirondacks, the elk were protected by a special statute which provided a penalty of \$100 for killing one of them, as well as imprisonment for a term of not less than three months or more than one year; yet this statute was not sufficient to protect these half-domesticated animals, which were killed in the first week of the hunting season. The guides are said to have a clue, which may lead to an early arrest of the butchers, but their arrest and punishment will not restore the elk, and efforts to stock the free Adirondacks with game will never be successful until those interested begin at the right end instead of—as at present—at the wrong. The public preserve will not amount to anything until it is conducted by the officials—State or federal—in the same businesslike manner that the owner of private property conducts his preserve.

For a period of twenty-three years the Federal Government tried to protect its game in the Yellowstone National Park. Congress authorized the Secretary of the Interior to provide regulations for the preservation of the game, and troops were furnished him to enforce these regulations, but it was not until 1894, after the buffalo there had practically been exterminated, that an efficient law was enacted. Persons who are interested in the establishment in the Adirondacks of preserves which shall be pleasure grounds for the whole people, in the preservation of the game there, and the doing away with the exclusiveness of the private preserves, may well work for absolute prohibition of game killing in certain sections of the Adirondacks.

WE publish in another column a communication from Mr. W. E. Wolcott, Secretary of the Black River Association for the Protection of Fish and Game, relative to the occupation of State lands in the Adirondacks by persons who have squatted upon them, and hold possession without legal title. In accordance with the statutes the Forest, Fish and Game Commission is seeking to eject these occupants. The tenor of Mr. Wolcott's letter is that while these people have no legal right to their homes, the removing of them is likely to engender a spirit of resentment and revenge which would lead to the burning of the forests and the destruction of fish and game. Mr. Wolcott does not concede that the squatters have any rights which should be respected; but he does suggest that the State might be wise if it should refrain from enforcing its rights in the matter, because of this possibility of revengeful incendiarism. This, however, seems to us to involve a position that is untenable. However much ground there may be for believing that the occupants, if ejected, would resort to the torch, we cannot say; but it does not seem reasonable that the State should be governed in its course by fear of revenge.

THOMAS SEDGWICK STEELE, whose name was familiar to readers of *FOREST AND STREAM* twenty years ago, died on September 11, at the age of sixty years. Mr. Steele was a well-known artist, who excelled particularly in the representation of still-life. He took up amateur photography in the beginning of its popularity, indeed as far back as a time when it was necessary for the amateur to do his work with wet plates. In the late '70s he made a trip in the Maine wilderness, which furnished material for a series of articles in *FOREST AND STREAM*, afterward gathered into book form under the title, "Canoe and Camera." This was followed by a second volume, "Paddle and Portage." These books had wide popularity and were of no small influence in directing public attention to the pleasures of amateur photography and of wild life in the wilderness.

THE Maine authorities have done one good piece of work in punishing the summer deer killers of Deer Pond camps. There is reason to believe that this poaching has been going on for years, and that the authorities did not succeed in capturing all the guilty parties implicated.

The Sportsman Tourist.

A Garden Island of Champlain.

BY ROWLAND E. ROBINSON.

With illustrations by Rachel Robinson.

IN the Baie de Vaseaux of the old French explorers, not far from the mouth of the sluggish Little Otter and that of the clear hill-born stream of Sungah-nectuk, lies Garden Island, an emerald set in crystal deeps. The massive rocks, red, green and brown, that uphold it, can be discerned through the limpid depths, stable and unchanged save by the slow erosion of the water, though near three centuries have passed since Sieur Champlain and his companions first set eyes upon it, when they paddled southward with their war party of Abenakis contemplating the country and seeing "on the east side, very high mountains capped with snow."

Whence its name no one knows or whether it is Garden or Gardner, as it is sometimes called. Doubtless the island had a good Indian name full of meaning, the "Island of the Fishing Place," or the "Smile of the Great Spirit," or the "Island of Blossoms." It is safe to assume that its original discoverer was no gardener. His wife, or wives, held that position in his simple establishment, and centuries ago, may have tended a few hills of corn among these rocks. He was a hunter and warrior, and to-day may be found an arrow point that he or some of his after-comers lost or let fly here. The island is well named, for though scant of earth for a garden, it is blossomy enough in early summer to have received the name from some visitor in a long ago June. I have seen it so white with bloom that at a little distance it looked as if the waves of all Petowbowk had stranded their foam on its rocky shore and tossed it into the shrubbery. Then, too, it has the delicate blush of wild roses, the glare of field lilies and the dull gold of lady slippers.

Bill Bigelow, by courtesy and the untold possibilities of soap and water, a white man, certainly not an Indian further than dirt, laziness and basket-making go

landed here and called every green thing upon this island a barbarous name. So intent were they on science that they did not see the waves dancing and tossing the images of the clouds, nor the sky arching over them from the Crouching Lion to Tahawus and tangling its silver fleeces on their peaks, nor Split Rock Mountain and the green headlands stooping to the blue level of the lake, but they found a new variety of *Brownii*, and were happy.

To-day the island is held chiefly by a party of crows, who, becoming aware of my intention of landing on their domain, after some clamorous circling overhead, go over to the mainland, beating the air with labored strokes. A sandpiper, on the shelving rocks, to which my prow points, balances himself on his slender stilts for a moment, and then skims the shore with downward-pointed wings, and a kingfisher launches from his perch on the outreaching arm of a cedar, and with his big head towing his body, or little body pushing his head, puts a girdle of clatter about the island.

So, when my boat's bottom—keel she has none—

THE JUTTING SHORES.

grates on the rocky slope where many a birch—and elm-bark craft of Abenakis and Iroquois has been before it, and I step ashore, I am in undisturbed possession.

There are traces of former occupants from the rude fireplace, with its warm ashes and smoking brands of yesterday's fishing party, back to the water-worn pot shards, arrow points and flint chips of its aboriginal owners, whose fires were long ago quenched and the ashes scattered by the winds of past centuries.

A well-beaten path leads to a hut in the interior, built by some inland people of the continent for their accommodation when they come to the coast a-fishing. Inboard, also, are pits scooped out by searchers for hidden treasure, who were not money diggers, for they dug no money, though they might have gained its equivalent if they had worked half as diligently in more fertile soil. Here they dug down with great labor by the light of pine torches, into the crevices of the rock, speechless, for with money diggers silence is as golden as coin and quite as hard to keep. The owls hooted at them, and a loon, awakened by their pother, sent his devilish laughter across the bay. At length

A ROCKY POINT.

someone's bar or pick struck the money pot, when a surprised exclamation sent the treasure rumbling down into the maw of the island, far below the reach of pick or spade, too deep to bend any divining rod toward it, though cut from the northernmost branch of a witch-hazel. Speaking at the wrong time seems to be the curse of treasure-seekers as of many others.

Thirty years ago there was a curious rocking stone on the western point of the island, taking the brunt of the winds from all quarters but the eastward. It was three yards square and a couple of feet thick, and though no one ever "hefted" it, could safely be set at some tons' weight. When any sea was running, it

would rock a couple of inches, a seam opening on its inner side as each wave receded and being closed by each incoming wave with force enough to nip off a cedar wand as big as one's finger. At length it toppled over into the lake, for the builder of the island, in His own way and time, is taking down His work. On this slightly swaying platform a lazy angler might sit with his rod across his knees and be lulled to sleep by the gentle motion and the sound of waves lapping the interior of small caverns explored only by fish and mink, till a fish, lured by his bait, magnified and multiplied in the swirl of green water, seized it and tugged him out of dreamland.

Doubtless the island's coast has always been haunted by fishermen. Of old, by the Indians, with their bone hooks; by the kingfisher; by the sheldrake, and by the mink, fisher and fowler, too, taking, when the chance offered, his feathered brother fishers. Now, the troller skirts it, with slow oars, the bass fisher anchors his skiff on the reefs, the perch fisher drops his line from the jutting rocks, and the night liner overhauls his many hooked cord hourly under the stars, till a poor fish is put to its wit's end to discern a free minnow or worm from one with a hook inside it, or a minnow from a shining bit of metal, and at times seems to choose starvation rather than such uncertain fare. But fishes have seasons of foolishness, when they forget all experience and fill the fisherman's basket or string with many unhappy members of their tribes.

There are some birds, though not so many as on the mainland. A few sparrows and vireos nest here, but I do not remember seeing any robins, though one would think in their choice of a summer home the absence of cats might overbalance the scarcity of worms of an edible sort. There are thousands of horrible centipedes with a double fringe of legs, hard looking fellows cased in shining brown plate armor that nothing short of starvation could induce a decent bird to try to feed upon. Indeed, they seem to escape all enemies but old age, and one may find, in places, a double handful of their mummied corpses, crumbling to decay. Crows are frequent visitors, for they find some eggs to steal, and the offal of fish. And more than once I have startled an eagle from as mean a repast as the crows or from the tallest tree, where he was comforting his hungry inside with a snatch of sleep or waiting for what the waves might bring him. It is an odd day any time between May and Novem-

A DISTANT VIEW.

ber that one is not to be seen hereabouts, scaling the airy heights above the bay, or faring across them to another shore, nearer the sky than to us. I have seen a fleet of seven or these upper-air men-o'-war sailing over these headlands.

Of quadrupeds, there are but two kinds resident, so far as I know—minks and meadow mice. The first, since that sad day for the race when its fur became fashionable, have become very rare; the last I have known to be so plenty that campers here were greatly annoyed by them. At times there are none to be seen nor any traces of them, and doubtless in an unfavorable winter, the whole mouse population of the island is destroyed. Then its coasts are clear of them, till in the spring floods, some Noah of their race is cast ashore here with his family, a hollow log, their ark, and the patch of earth is again replenished.

In winter, when the habitation of the fishes has a ceiling of ice, many a fox trots across to explore these shores, and in the mice seasons gets his fill of the fatness of the island. Now and then, timid hares limp over the crystal skylight, scaring with their shadows some wide-mouthed pickerels, big enough to swallow them, to take a nibble of the island brush. After snow falls the hound comes bellowing on the trail of these, his voice unheard by the pickerel and perch just beneath him, but carrying consternation to the chase a mile before him, and starting muffled echoes out of all the snowy, wooded shores of the bay till fox and hare know not from which quarter their enemy comes. In their day hunted deer rested here from their swimming across the bay to escape wolves or hounds; and otter, coming over from the river to which they gave a name, fished here with better luck than any of us hope for, and fed and basked between catches on the rocks. No sheep or kine graze here, but now and then, in winter, the horse of a fisherman or wood stealer finds shelter and munches his meager baiting of hay, while his master drops his line through the ice, or with his ax robs the island of some of its crown jewels.

Off far-away Thompson's Point, are specks that I know are fishing boats, with men in them, waiting hopefully or lazily for bites, and from nearer shores I hear the voices of jolly anglers, trolling snatches of songs and inquiring one of another the day's luck, but all aloof from me, and keeping so till I begin to feel as if I were out of the world.

Presently, an awkward boat, propelled by hands unused to oars and paddles, comes yawning across the bay from the Little River of Otters. Its prow points by turns to half the points of compass, like a hound trying to follow a cold scent, but by and by its devious course ends at our island, with some bumping and scraping of its bottom. The crew crawl and tumble ashore, and prove to be three mountaineers from the backbone of the State, come to the lake for a day's

FISHERS

"HAUNTED BY FISHERMEN."

to make him one, and too unhappy for a negro, strengthens this supposition. He complained of a pain, though one would never think he had life enough to feel one, concerning which he drawled, "They tell me it's new-rology. I don't care if 't is, I c'n cure it when Garden Islan' blows aout." William has faith in the healing touch of nature, when she becomes ready to reach out her hand to him; and there is a largeness and happiness in his expression of faith—a whole island blossoming at once for him!

After the manner of other adventurous voyagers, I coast about the island before entering upon it, to see what fashion of land it is and what its ports and whether there are enemies upon it, to oppose even with so much as ungentle speech.

It is but a little patch of not more than two acres, counting its rocks and every foot of its thin soil. All its north shore is an escarpment of rock, a wall of noble masonry, built to ward off the north wind and its waves. Not many years ago it was crowned with a brave growth of cedars, but they have been cut down by crueler foes than wind and waves. Only one little cove, like a sally port where one may land a boat on a shelving, rocky beach, or set forth on his voyage, breaks the solid bulwark. Here and there out of the seams of the wall, a harebell hangs by its slender cord, perhaps knolling water sprites inshore with a chime unheard by my dull ears. To me, it beckons with its graceful, noiseless swing.

From this gray bulwark the surface slopes to the south shore, which slanting gently to the bay, invites invasion from this quarter. Up its incline, when the south winds blow, the waves wash to the border of bushes, which mark the high water line. When the lake begins to fall, in early summer, a few rods off the eastern point, a reef or islet gets above the surface, and at very low water, another, still further to the east, both more barren than the nakedest boulder in an upland pasture, for they have not even a lichen upon them. Once, when a comrade and I landed on the larger one and spattered it with the scales of the fish we dressed there, we named it the Isle of Scales, but the name did not stick to it much longer than the scales did.

Inside the steadfast boundary of rock the island is covered with a thin layer of reddish soil, wherein flourishes a goodly though small growth of oak, hickory, white birch, hop-hornbeam, elm, linden and cedar and many shrubs, flowering plants, grasses and vines, all native, for it is not known that any one has ever sown any crop here, nor reaped any, but now and then a load of wood, handful of herbs or a nosegay.

Botanists find it a rich field and get here some plants and shrubs hard to find elsewhere, and a rare variety of chestnut oak. I have lately heard of two who

Klamath and Crater Lakes.—I.

THE results of our outing last year were so satisfactory and enduring, especially from a health point of view, that I decided to take a similar one this season, provided I could secure the first great requisite—a congenial companion.

Fortune favored me in the person of Mr. Zerah Smith, an old Nevada friend and cattle man, who had closed out his interests there and moved down to the bay to enjoy life. Southern Oregon was selected as the field of operations, and on July 15 we took the train for Ager, Siskiyou county, and a few hours later we were whirling along by the great grain fields of the Sacramento. When we awoke the next morning Shasta's mighty butte was towering over us, and for hours this glorious peak, hoary with the snows of ages, shadowed our pathway, the serpentine character of the road throwing it at times into every point of the compass.

Although sadly disfigured by the ravages of lumbermen since the days when the old sportsman Sisson reared his humble lodge beneath its lofty pines, its base is still beautiful, and the limpid, bawling streams that find their sources here still harbor many a lusty trout. How I strained my eyes to catch a possible glimpse of old Ransacker, one of whose later sketches, in which he saved his dog from a watery grave, was such a gem in its way that it lingered in my memory for weeks. Quite likely I should not have recognized him had he been there; but I knew just how I thought he ought to look, and the sight of him threading the aisles of that silent forest was the only thing needful to complete the picture.

Shortly after 12 M. we reached Ager, the terminus of our railroad travel, and a trip of sixty miles with a pack horse lay between us and Pelican Bay on upper Klamath Lake. We had wisely provided ourselves with pack saddle, kiacks, and most of the more important necessities of the trip, as the outfitting facilities of the town are not great; but from Mr. Ager, son of the founder of the place, we secured a fine pack horse, and the two stores there were able to supply all that we needed in the provision line. Our arrangements were all perfected during the afternoon, and early the next morning we took the road, going fourteen miles the first day and reaching the Klamath River, a stream we followed most of the way to the Falls. We were now approaching the Cascade Range. The country grew rougher and was but thinly settled, but as there was considerable freighting by wagon from Ager to the Klamath Falls—formerly called Linkville—we found ranches five or six miles apart, where feed for stock and men could be obtained. We made our first camp on the bank of a stream near one of these ranches kept by a Mr. Lennox, where we procured milk and butter.

The elevation was now steadily increasing, and the mountain meadows began to appear, especially on the banks of the river; but the wonderful floral display, the hummingbirds and butterflies that had made such a distinguished feature of the Mt. Kaweah region, were lacking; nor did we find anything like it in all that region; but the meadows were of extraordinary fertility, and we saw crops of timothy and red-top that would easily yield three tons to the acre. Every ranch had its orchard, and although the yield this season was very light in most places, owing to the cold backward spring, the flavor of the fruit was much superior to that of the south.

A six-mile drive the next morning took us to Shovel Creek, where we found an extensive sanitary resort, with sulphur springs hot enough to boil an egg. Here we caught our first trout. We made a stop of four hours in the heat of the day, and then went on five miles further to a ranch and teamsters' hostelry kept by Mr. Ways, an old pioneer and his wife. We were now fairly in the mountains; fine cold streams of water and heavy timber were all about us.

Ways proved to be a most entertaining character; and during the evening, as we sat enjoying a smoke on his cool veranda, he regaled us with many stories of the early days of California, going back to '49. He had been present at the hanging of the seven desperadoes in Placerville that gave that mining camp its primitive name of "Hangtown;" had seen Joaquin Murietta, "Three-Fingered Jack," and several other rather celebrated gentlemen of the road, and he had an inexhaustible supply of bear stories, and was so thoroughly versed in the details of those stirring times that it was 11 o'clock before we sought our blankets. Add to this the fact that his wife was one of the best cooks we met, and that the natural attractions of the place were very great, and all combined made this one of the most pleasant memories of the trip.

Before noon the next day we reached a station called Topsey, the highest point on the road between Ager and the Falls, with an altitude not far from 6,000 feet. The forest here was very heavy, and soon after crossing the divide we began to find deer tracks in the road with abundant evidence of rattlesnakes. In one place six of these reptiles had crossed the road within a space of fifty feet. We were now in Oregon; off to our left and 2,000 feet below us the rapid Klamath, here about seventy-five yards wide and ten to twenty feet deep, was coursing its way to the sea. It is not a clear stream, the immense growth of tule around the lake at the source has colored the waters until they look like turbid absinthe.

The next night we passed at Chase's ranch, sixteen miles from Ways; and the following day we crossed another timbered ranch at the eastern base of which we found a hamlet consisting of two general stores, as many saloons, a blacksmith shop and a few dwellings, that rejoiced in the name of Keno. Here we crossed the Klamath on a substantial bridge. The valley now widened to three or four miles, stretching northeast as far as the eye could reach. On both sides near the river it was a tule marsh, but the borders were fine meadows, where many mowing machines were at work, although the yield per acre was not more than half as great as in the smaller mountain meadows. We reached Klamath Falls, twelve miles from Keno, early that afternoon.

This queer little town of about 2,000 inhabitants has some peculiar features that merit special mention. It consists chiefly of one business street, which extends for nearly a mile down the river, which at this point is the habitat of incredible numbers of garter snakes, many

thousands of which can be seen in a few minutes' walk along its banks on any bright summer day congregated in horrid squirming masses that would have adorned "Dante's Inferno," or furnished John B. Gough with a temperance lecture that would have thrown his audience into hysterics. Even on the main street they can be seen crawling about in the yards and on the sidewalk, regarded with equal indifference by the women and barefooted children. Strange to say the people pride themselves upon this phenomenon, saying that they kill mosquitoes and rattlesnakes. A night's stay at one of the hotels made me rather skeptical as to the mosquito part of the proposition, but it is said to be a fact that no rattlesnakes are found in that vicinity, although they are abundant in every other part of the country.

Soon after the sun went down myriads of little black toads came swarming out upon the sidewalks, which were soon highly decorated with large splashes where the batrachians had been crushed beneath the feet of the pedestrians. Great white pelicans floated fearlessly like tame swans upon the water within shotgun range of the bridge, and ospreys, eagles, Canada geese, ducks, shags, etc., were continually passing overhead between the lakes. The front portion of a broken shell had jammed so firmly in my rifle at Topsy that I could not dislodge it; but I found neither gunsmith nor locksmith at the Falls, and had to resort to a blacksmith shop, where, by the aid of a bent file shank, it was finally removed. The town seemed quite prosperous, and at the store of Mr. Isaac Duffy, where we laid in a few supplies, we found the prices very reasonable, and the goods of a good quality, but the postoffice and many of the stores close an hour at noon and at night for meals.

Our destination was the ranch of the Griffith Brothers, at the north end of the lake. They have a large scow steamer that makes occasional trips to the Falls, but as we could not learn when it would arrive, we decided to go there by land. The distance was about thirty miles by either route, and I started with the pack horse at 5:30 the next morning, Z. remaining behind to come with a saddle horse, as he was getting footsore.

There is not much timber in the immediate vicinity of the Falls, but about five miles out I ascended a well wooded range and went down into a valley on the other side which was about four miles long by one wide. It was a charming place to look at surrounded by the timbered hills and dotted with grazing stock; but as I went through it I found a number of deserted cabins, which indicated that its resources were less than had been expected by the settlers. Indeed, Klamath did not seem to me to be a very prosperous section outside of the Falls and the main lines of traffic and travel; its elevation and latitude made late springs, and summer frosts common. Its resources were confined to lumber, hay, and stock raising; and squaw men were more numerous than I had seen elsewhere. In some cases the deserted cabins had belonged to logging camps; in others they were the accessories of fraudulent timber entries, but there were those which gave pitiful evidence of the failure of some poor settler to establish a home. Little gardens inclosed in neat picket fences, milk and chicken houses all falling into decay and left to mice and squirrels, told the story of wasted years.

At the upper end of the valley swarms of grasshoppers about the size of the Kansas variety, but of a light yellow color, had devoured everything but the sage, and were so numerous that they changed the color of the soil; and the grasshoppers in turn were being devoured by hundreds of sparrow hawks.

Again I ascended into the shaded hills and hour after hour pursued my lonely way through forests of spruce, fir and tamarack. I had left without breakfast, before many of the easy going dwellers at the Falls were astir, expecting to eat at some wayside house or to stop and prepare my meal by the water; but I found neither occupied house, water, or grass until 2 o'clock, when I reached the banks of Rock Creek, twenty-five miles from the Falls. Here I found all the requisites for a camp, but it was still early in the day, and I pushed on several miles further, only to return and unpack for the night beneath the great trees that shaded its rocky bed.

I did not hurry the next morning, as I knew I had not far to go, and by 10 o'clock I reached the ranch of the Griffith Brothers, only about three hours ahead of Z., who came through on horseback that day.

As I neared the lake the road passed through thickets of young cottonwood, and in one of these a full grown ruffed grouse arose like a rocket at my feet and went sailing away over the tops of the trees. It was the first I had seen in thirty years, and my heart warmed within me at the memories of youth that flooded my breast at the sight and sound of this splendid bird.

We were now at our destination, and a brief description of our surroundings will be in order. The lake is about twelve by thirty miles in area, most of it is from ten to twenty feet in depth, the deepest place being about 160 feet; it has an altitude of 4,800 feet. Around it, especially on the north and east, are immense tule marshes of many thousands of acres, intersected by lagoons, making of it a breeding place for water fowl that can hardly be surpassed by the Great Slave Lake of the north, and giving its waters the peculiar color noticed in the river. There are two prominent islands in the lake, each having an area of over 100,000 acres; both had families on them a few years ago, but now have only a few horses that live there the year round.

The Griffith ranch, "The Poplars," is located on a lagoon that enters the lake half a mile away; this lagoon, which is about seventy-five feet wide by eight in depth, is formed wholly by springs, and in its upper reaches is perfectly clear and very cold. Half way down on its western bank is a clump of large pine trees in which there is an immense spring; this grove was for many years the summer resort of ex-Gov. Budd, of California, and is known as "Budd's Grove." It is an ideal camping spot.

The scow steamer spoken of was moored to the bank close to the house when we arrived. It is about 70 by 14 feet, with a stern wheel propelled by a threshing machine engine and boiler. We were told that next year a new boat was to be put on that would make regular weekly trips to the Falls.

The afternoon was spent in pitching our tent and in arranging matters for a two weeks' stay. There were six or eight other campers there, and in September there

fishing. They are genuine Green Mountain boys of the sort that followed Ethan Allen, each worth half a dozen of our softer valley folk. They are lathy and wiry, made of such rock-hardened stuff as was Gersham Beach, who on foot made the rounds of the scattered settlers, sixty miles in a day, to rally the men for Ticonderoga. They hardly wait to get themselves steady on their feet or more steadily seated on the rocks, before they ask if I have caught any pickerel! Of all fish that swim, these mountain men, past whose door stones trout dart, covet most this gaunt, hungry and slimy fresh water shark.

From fishing talk we presently get to hunting talk, and it turns out that the captain of the crew is a bear trapper when he is not tending a sawmill, for up in the mountains there are yet logs to saw as well as bears to trap. In the lowlands logs worthy the name will soon be as scarce as bears.

The captain shot a wolf a few summers ago, and has trapped many bears, but never shot a free one. This he greatly desires to do, for he says:

"It don't somehow seem nowadays fair nor no satisfaction to shoot a bear in a trap." He once heard his dog barking all day, but paid little attention to it, as he supposed it had only a hedge hog treed, but found out next day what an opportunity he had lost, when, going that way, he saw in the mellow soil the tracks of a bear, and once he snapped two ineffectual caps at a bear running through a berry lot. To-day he is intent on pickerel, and I fancy he would exult more in the capture of a 10-pounder than he would in the trapping of a big bear.

I once knew a hunter of the Adirondacks who had had an adventure in a bear's den that put in the shade General Putnam's killing of the wolf, who wished for three things to satisfy his ambition as a hunter—to kill a panther, a moose and a wild goose! More than once he had seen the track of his moose, made only the night before; for two days he had followed two panthers, twice getting sight of them, just too far off for a shot; and once the wild geese had their harrow wrecked in a snowstorm within gunshot of him, but, alas! his gun was at home, further from him than the geese were.

Our captain's crew, younger than he and unused to the hardships of hard-water drinking, cannot stomach the water of the lake, good enough for us, but so unlike their crystal wine of the hills, pressed from perennial snow banks. So they propose going over to the mainland for cider, for the apple and its juice is in favor with highlander and lowlander. When they are fairly off and headed under my direction for the nearest cider mill, I take the captain into my boat and go trolling about the island shore, he holding the line. Presently the glittering spoon flashes past the harbor of a pickerel, and Longface, the Pirate, dashes out of his weedy port to capture it. The captain's arm is suddenly jerked out full length, and his fingers sharply cut by the line, which is wound round them. He hauls in the twenty yards of it in frantic haste, making many a misgrab and getting more excited, I'll warrant, than he ever was with any but his first bear. At last, by main strength and good luck, he gets his prize aboard, a 5-pounder, and is jubilant over it. He "hefts" his fish and caresses it and swears by a wood god of the hills, "By gum, he's a lounder!" and asks with little doubt of an affirmative answer, "Now 'tain't often you git a better one, is it?"

Seeing that pickerel can make a man so happy, I shed my prejudices and wish the tribe may increase. Luck now forsakes us, and after some unprofitable fishing we go ashore, and the captain tells me of some of his familiars—as strange animals to me, a dweller in the lake region, as bison and bighorns—the "saple" or pine marten, and his big cousin, the black cat or Pennant's marten. The last, he thinks, lives to a considerable age, judging so from the great difference in the age of individuals and from the largest ones being grizzled about the head. In hunting them, the hunter must go slowly on the track, to tree them. If hurried, they will whip almost any dog. They are as easy to catch in a steel trap as a skunk or a woodchuck. The best bait for them is roasted hog's liver. The fisher is very tenacious of life. The captain and a comrade fired six charges into one without any apparent effect. At last, the captain found two buckshot in his pouch, which brought the fisher down. After being so peppered with small shot and brought to unconditional surrender with the two buckshot, and then carried a mile on the back of his captor, he revived enough to catch hold of a limb and nearly pull himself away from his bearer. Then he was pummeled with a club till he went over to that class of fishers which are now the majority. The small shot were found flattened just under the skin.

With such discourse the captain entertained me till the big line boat comes wallowing past in the old path of Champlain's canoes, gay with flags and streamers, and belching steam and smoke, and sets my storyteller agape with wonder and admiration. On his waters are no craft but the mill pond scow and the toy boats of children.

A quarter hour later the swells of the steamer come in, lashing the rocks with slow beats, and rolling in even lines with the bay. Then we see the boat of the cider-seekers tossing over them, and presently it comes to port and lands its crew and stores. The captain welcomes them joyfully, for his clay is dry, and after irrigating it with cider, shows them with modest pride the monster of the lake which he has caught. They wonder at it and admire it as inland people visiting the sea coast might a stranded whale, but are sorrowful it was not their fortune to bear a part in its capture.

To my thinking four men over-populate this small island, though last summer a party of twenty-one campers were crowding and jostling one another upon it; so bidding farewell to my friend, the captain, and his comrades, I leave them to hold the island, and embarking, take my way homeward into the mouth of Little River of Otters, and up between its green paling of rushes.

ROWLAND E. ROBINSON.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

are often 300 or more encamped there. About four in the afternoon two ladies went down the lagoon to near the mouth and returned an hour later with two trout, one of 12 and the other 16 pounds, the landing of which had exhausted the energies of both; these were the largest fish taken during our stay.

The next day, as the steamer was going to the Falls, I decided to take the trip to get a view of the lake. We were nearly seven hours on the way, stopping an hour at one of the islands to pick berries and take off one of the horses that were running loose there. The boat was beached on the south end of the lake and we walked a mile down the river to the town. The boat stayed at the landing that night, and early the next morning steamed homeward. Many geese, pelicans, shags, and ducks could be seen in all parts of the lake. When we came to the other island we made a landing to get a cook stove from the deserted dwelling. The oven door was slightly ajar, and looking in we found a rattlesnake cosily coiled up inside. He was ejected and dispatched without ceremony, and the stove and a lot of potatoes from the garden were taken on board, a few more berries were gathered, and we continued our homeward voyage.

The next morning Z. and I took a skiff and went down the lagoon with a spinner and fifty feet of line trolling behind. We had not reached the mouth before we had a strike, and after a sharp fight, in which the gamy fish cleared the water many times, we landed a 7-pound trout. This was all the fish we needed for a day, at least, and we returned to camp.

The next morning we started out with our rods, reels and long gut leaders, more intent upon sport than for count or big fish. Not getting a strike in the lagoon we pulled out into the lake and went three miles north to another similar branch, going inland more than a mile, at the head of which was a fishing resort called The Lodge. This stream, like the other, came from springs and was equally clear and cold. We did not see any fish at first, but began casting soon after we entered it, and within ten minutes had a strike that set the reel humming like a buzz saw. Z. sprang to the oars, and, with swift and skillful strokes, anticipated every possible move as I strove to keep him from the brushy banks, until he gave that up and started at full speed down toward the lake, more than a quarter of a mile away. The braided silk drew like a wire through the water, as, in spite of the heavy drag, yard after yard left the reel with alarming rapidity; fifty and then seventy-five feet disappeared through the rings, and a moment later the water broke one hundred feet away and the grandest fish I had ever hooked with a rod cleared the water with a spring that carried him two feet into the air.

My line and leader were new and of the best quality; my rod was of steel and equal to any strain that was likely to be put upon it, but four times I drew him almost within reach, only to see him dash away again apparently as fresh as ever. Once more he was brought to the side of the boat, this time within reach of the gaff, and a moment later a rainbow trout of full 6 pounds lay gasping on the boards at our feet.

Two smaller fish were taken soon after, and four others ranging from 2 to 4 pounds were lost by their getting to the banks. Then we took in our lines and returned to camp in time for an early dinner.

Early one morning a few days later we pulled down the lagoon and out into the lake to explore a stream called Crystal Creek, about four miles north of the Poplars. Not a breath of air was stirring, and the surface of the water was like a mirror as we rowed across Pelican Bay toward a vast flat of tules and lily pads, through which the stream makes its exit. Mallard ducks were swimming about near the edge of the tules with broods of from four to fifteen ducklings about the size of robins. Trout were jumping continually all about us. In the rarefied atmosphere the snowy pelicans floating on the surface looked as large as swans. I noticed that here only the white variety was in evidence, whereas in San Francisco Bay the smaller gray species largely predominates. Overhead the great fish hawks and a small species of gull, some white and others slate, were soaring and screaming for their breakfast. Twenty miles to the west, with its image distinctly reflected in the lake, the snow-clad peak of Mt. Pitt, by far the most conspicuous object in that region, rose to an altitude of 10,000 feet. This beautiful mountain is as sharp as a saw tooth, so that two men can barely find room at the same time upon its apex, from which point, I was told, forty-two lakes can be seen with the naked eye.

The lower reaches of Crystal Creek meander for several miles through the great tule marsh before mentioned. It is about fifty yards wide by ten or fifteen feet deep. For quite a distance up the waters are the same color as the lake, gradually growing clearer as it approaches the higher ground until the timbered hills are reached, where the exceeding purity even in this region of pure waters doubtless suggested its name. In most places along its banks in the marsh the tules are growing in the water but there are a few spots where the land is a little higher for a few square rods and these are covered with willows. On one of these, near the mouth, we found three Indian families who had come out from the reservation near Ft. Klamath for a few weeks' life in their old primitive style. They had built frail little wickiups of willows, where the squaws were weaving baskets to supply the popular civilized fad of the day, while the men paddled about in their dugouts fishing and gathering the roots of the lily pads. They were industrious and intelligent, spoke fair English and seemed to be a rather superior class when compared with the California Indians. Most of them have good farms with substantial houses and barns on the reserve, and some are quite wealthy, having many cattle and horses.

We rowed for five or six miles up the creek, preceded by flocks of half grown mallards that were very tame, swimming a short distance ahead until we pressed them too closely, when they would disappear in the tules. Trout running from ½ pound to 4 pounds we found in abundance everywhere, and frequently each of us would have a big fellow hooked at the same time, which, in a light skiff with fifty feet of line out, made lively work for us. Many that were not badly hurt we returned alive to the water, many others broke away in the tules.

After three hours of such sport as neither of us will be likely to forget, we returned to the mouth of the creek with twelve fine fish, enough to last us two days,

besides giving six pounds to some new arrivals who were making camp and had not yet been out. When we got back we found that two of our camping friends had been out on the lake with hand lines and had returned with twenty trout running from 3 to 12 pounds weight. They went for fish and we for sport, and I think both came back perfectly satisfied.

Although, with one or two exceptions, we had trout at every meal while encamped at the lake, still we never seemed to tire of its delicious flavor, and even brought away a mess or two to eat upon our way home.

There was no extortion at The Poplars. The Griffith Brothers were the most generous of hosts. The camping grounds, fuel, tables, etc., were all free. Horses had the run of a fine pasture for ten cents a day, and were stabled and fed for twenty-five cents. Meals were the same price, and butter, eggs, milk, bread, etc., were as cheap as in San Francisco. Good boats, skiffs, and white-halls, with lines, could be had for fifty cents per day; but, as is generally the case, it is safer to bring your own tackle. The Griffiths and their wives were untiring in their efforts to make it pleasant for their guests, and we shall always remember them with the most kindly feelings. The only disagreeable feature there was the mosquitoes; their name was legion, and they were of the most bloodthirsty variety, but they never troubled us on the water.

OAKLAND, California.

FORKED DEER.

[TO BE CONCLUDED.]

Lost in the Wilds of Alaska.

THERE is something weird and interesting still lingering about camp life in Alaska that renders it a fit theme for song, poetry and prose.

At the time of which I write, almost primeval simplicity reigned over that northern land—almost solitude and stillness.

The crew at the old salmon cannery operated by the Alaska Packing Association at the little post of Loring had completed their task of catching and canning 600,000 salmon, had loaded this valuable cargo aboard the sailing ship Coraphine, and had sailed to headquarters at San Francisco.

The little handful of men left behind to look after the cannery, trading post, and property in general, through the long winter months, could be counted on the fingers of one hand without including the thumb.

As the sun sank lower and lower down behind the wooded island and the western portion of Clarence Straits which formed the southern horizon of our lonely habitation; as the days grew shorter and shorter, until it seemed as though it was almost always night, a peculiar, weird, canny gloom crept over the little band left to our fate and in the grasp of an arctic winter.

Snow came down from the dull black heavens in a slow drifting zig-zag course that seemed to add gloom and solemnity to the already cheerless situation.

There are life and electricity in the howling tempest, the booming thunder, the chains and streaks of lightning that split and rend heaven and earth with its mighty force that compel one to look upon its devastation with awe and admiration. But the deathless stillness during the short days of my first northern winter, without a trace of life or animation, accompanied by that incessant drift, drift, drift of the ghostly little particles of frozen vapor always coming down, down, down, burying everything with its feathery, fluffy whiteness, and making travel impossible for everything except the meanest, cruelest, and most savage beasts—the wolves and wolverines—more than I could bear.

Oftentimes during the long dark night as I lay awake thinking of the peculiar influences that surrounded me in this northern home, and wondering how the loved ones at home in sunny California were faring or enjoying themselves, I would hear the calling death cry of some unfortunate deer that was being torn to pieces while alive by a hungry pack of the great black and gray timber wolves the late snow had driven from the interior.

During the summer some of the crew brought home a poor little half starved motherless fawn, and by giving it great attention we managed to improve its condition until it was large and strong, and almost as beautiful, innocent and as playful as a girl baby. Fearing that the Indian dogs would kill or injure it if it was allowed to run at large around the post, we decided that we would take it down the coast several miles and turn it loose on a small island which lay several hundred yards off shore, and made what we supposed to be an ideal home for our young pet. I had been detailed to look after it for the winter; I knew its sweet, innocent voice as well as I did my own.

It was hard to lie still and listen to an average ordinary wild deer meet its fate at the mercy of the wolves, but when one night I was awakened and listened to the call of our little pet fawn for help, the sluggish blood ran cold in my veins. I leaped from my cot, grabbed my rifle and fired several shots into the black night air in the vain hope of scaring or driving the beasts away from our helpless, innocent pet. But alas! the cries came louder and louder, and then, what made it all the more effective, it seemed to call my name and speak it as plainly as a child would that was calling me under the same circumstances. I took a solemn oath that night that the blood of our pet fawn would be atoned.

In referring to my old diary I see the following entry: "November 13, 1901. Went hunting in Deep Bay after wolves. Found remains of our pet fawn. Tom Brown lost."

Tom had been ship carpenter on the steamer City of Topeka, operated at that time as the only regular mail and passenger steamer in southeastern Alaska. He had left his ship during the summer months to join a party searching for placer gold mines, and had turned up with us fellows at the post in the fall.

I told the boys that I had heard the wolves kill our pet fawn during the night, and that I was going to exterminate the whole pack, and asked Tom if he would assist me in the work. He readily agreed to help. We left the post in a rowboat and traveled south to the island where we had left our pet fawn. On arriving I looked for tracks and saw where it had left the island and taken to the water. We rowed across the channel to the mainland and saw where it had landed on the

beach after its long swim and had started straight for home, or in the direction of the post. It had gone more than two-thirds of the distance when it had been overtaken, killed and devoured.

The scene of the death struggle presented a picture that plainly showed the experienced hunter and close observer how the cunning wolves had outwitted the brave little fawn. From their tracks it was plain to see that after the deer had been located by the pack, two of the largest and most powerful had made a great detour and had got in ahead of the fawn and secreted themselves, one behind a large boulder and the other at the end of a large log, around the end of which the fawn would undoubtedly pass. Then the main pack had brought up the rear with a rush. A half dozen great leaps brought the frightened fawn to the end of the log behind which one of the cunning brutes had concealed himself, and by leaping out just before the fawn was up to him, he had the advantage of its momentum, and in its endeavor to stop and go the other way it was overtaken by one, then another, and finally the whole pack. The attack and finish were complete. After the feast they had rolled around on the snow to clean their coats and had left in a body for the dense timber, traveling, as they always do in the snow, in single file, and every wolf stepping exactly in the leader's tracks. I judged from the signs at the scene of the killing that there were twelve or thirteen in the pack.

I had come well prepared with strychnine and cyanide of potassium, and displayed all my skill and energy in laying a bait that I was sure would bring results. Before leaving the post I had made a number of small tallow balls, and after drilling a small hole into the center of each and inserting about one grain of the deadly poison, then filling the hole up with fresh tallow and sealing it carefully I made a bait that was tasteless on the surface and deadly when it had melted in the throat and stomach of the wolf.

Knowing the wolf's partiality for fish, I told Tom I was going out to get a halibut for them. He wished me good luck, and said that he would take a little tramp through the woods while I was gone and arranged for me to meet him, after I had completed my work, at the head of the bay, about one-half mile down the beach.

I rowed out in about twenty fathoms of water and was not long in getting a fine hundred-pound halibut. Tom in the meantime had disappeared in the dark green snow-burdened timber on his snowshoes. I came back, inserted the deadly little balls or tallow capsules in the flesh of the halibut, and dragged it up on the beach far enough so that the next floodtide would wash over it and remove any scent that I had left behind. Having completed this work, I set about to bury the remains of poor pet Peggy, and as I noted the little red braided ribbon that had served as a collar, all plaited, ornamented and decorated by some half score of sailors and employes around the post, I remember that I whispered to myself that the whole pack will bite the dust for this. I was only a boy then. Since that time I have assisted in laying to rest in the interior snowy wastes of Alaska some of my good old camp mates and comrades, but never was I so completely overcome with grief as when I buried the remains of that innocent, harmless, pet fawn.

The day was drawing to a close, it was now 2 o'clock, and it would be dark at 4. Tom had been gone some time. Dull gray snow clouds overhung the cheerless sky. I knew from the indications that it would be snowing soon. I jumped in the boat and rowed up the beach to where I was to meet Tom. He was not there; a hunter's intuition told me that he was lost. I hurriedly gathered a huge pile of knots and limbs and with some difficulty built a fire, and after leaving a note in a conspicuous place telling him to remain there until I returned, I rowed back and took his track. Snow was falling thick and fast. Getting the general direction of the wind (I had failed to bring my compass with me, and this was my only guide), I snowshoed hard and fast with the vain hope of overtaking him. It was plain to see that he had not been in the timber ten minutes before he was lost and traveling in the opposite direction from the one he intended and told me he would take. The trail grew dim and finally completely disappeared, entirely obliterated by the fast falling snow. I could see by the course taken that he would be likely to follow the base of the mountain in an easterly direction.

Hastily retracing my steps I went back to the boat, rowed along the coast to where I had built the fire and was not surprised when I failed to find him there. Minutes were now hours to me, and not one was to be lost. Darkness was coming on, the snow falling fast, and the weather growing bitterly cold. Raising my good old rifle to my shoulder I decided to fire the old Hudson's Bay hunters' and trappers' signal of distress—three shots at intervals of five seconds each. Bang—1, 2, 3, 4, 5; bang—1, 2, 3, 4. At this I stopped as the last faint echo of the heavy gun died in a distant rumble over and among the deceptive hills. I heard a call; I listened. I heard again. It grew louder and louder, until it finally was on continuous chorus. I had heard it before. It was the same pack of wolves that had killed the pet fawn. Would my good partner share its fate? A nauseating sickness came over me. Then, too, I was feeling the effects of the piercing cold, and had not eaten anything since breakfast. Tom having taken the lunch with him in his hunting coat pocket.

Again I fired the signal of distress, and again came the same unwelcome blood-curdling chorus of the wolves. But not a sound from Tom. I fired only singly now, as my ammunition was growing short, and I did not care to be left without any under the conditions. I landed in several places and called long and loud, only to be answered by the hungry, howling, mocking pack that seemed to haunt me with their mimicry. I rowed along up the beach until I was directly opposite where the wolves were howling. I broke my way through the shore ice and landed on the beach. My efforts in trying to build a fire were in vain.

The darkness was intense. The wolves stopped howling, but this was not a relief to me, as I knew that they were either sneaking down to have a look at me or were stalking other unfortunate prey. I was at a loss to know what to do; I thought seriously of going back to the post and getting help. But then what was to be gained. If I could ever find my way in the total darkness I would not be able to return before morning, and by that time Tom would be dead. No, I would stay and call often and loud and try and get him to hear me. I sat and listened for

his welcome voice or an echo from his rifle. It did not come. A thought flashed through my dizzy brain. There was a small river a half mile up the beach; would he know enough when striking that river to follow it down stream to its mouth. Shivering with cold I worked the boat up to the mouth of the river and waited. It was now 11 o'clock. I grew sleepy, but with all my remaining energy I climbed from one end of the boat to the other, and was threshing my hands about me when I saw a flash of light a long distance up the river. I called long and loud, but got no reply. Jumping on my snowshoes I traveled hard and as fast as my weakened condition would allow. There, beneath the spreading branches of a large spruce tree, lay Tom in a delirious condition. In his mad rush to extricate himself from the wilderness and from the wolves he had discarded his coat, hat, rifle, cartridges, and belt. In climbing over the logs and rocky ledges he had torn his finger nails, and lacerated himself. His last match that threw out that last little spark of light saved him.

Drawing on my last match supply I managed to get a small fire started. A clumsy, wise looking, prickly little porcupine, in making his rounds for food, was attracted by the light of the fire, or was sent to us by Providence, and served as our food until the storm had passed and day again dawned upon us. CALVIN H. BARKDULL.

The Old Saratoga.

A SHIP left Philadelphia a few days ago on a three months' voyage that I would give a good deal to make as one of her crew; she was the old wooden frigate Saratoga. This is the only vessel of the old navy that I ever had a chance to examine, but I was shown all over her while she was still in commission. I afterwards tried to inspect another of them as she lay in the harbor of Callao, the Hartford, but a marine on guard would not let me board her, even after I had told him I had rubber-soled yacht shoes on and would not scratch his deck, then held up a shoe for him to inspect. That set my Kanaka boat's crew to laughing and hurt the marine's feelings; he told me to "get that nigger crew out of that right away."

A large English cruiser also lay at anchor here. I tried her next and fared better. The blue jacket was on guard; he invited me on board, then sent me to the officer of the deck, who sent a side boy with me to show me all over the ship. Her big engines and guns were what I most wanted to see.

The Saratoga is out of date now, but was a fine ship in her day, and is claimed to be one of the fastest vessels under sail flying the flag of this or any other country today. She has made 14 knots an hour. Our Baltimore clippers in their time could not do much better than that, and they were the fastest ships afloat.

She is now, and has been for some time, the school ship for the State of Pennsylvania; and has just been completely overhauled at the Navy Yard, making her nearly as good as new again.

She is under the command of Commander G. W. F. Holmes, U. S. Navy; his executive officer Lieutenant Kunkle, and watch officers Allen and Davis, together with Dr. Reeser, the surgeon, completes the ship's roster.

His crew will be of about seventy boys between fifteen and twenty years of age, who go before the mast to learn to be sailors. The boys must all be residents of the State, and what surprised me most was the fact that until a day or two before she sailed the full quota of boys had not yet applied to go with her; they have to "pass the doctor," and not every boy who applies will be taken.

When I was a boy, could I have got a chance of this kind, I would have traveled on foot the whole length of the State if I had to do so to get there, and I would probably have had to walk most of the way; there were not many railroads then. I might have driven mules on the canal part of the way to save walking.

The Saratoga does not carry her battery now, but there has been put on board an elaborate sounding apparatus, to teach the boys how to find the bottom; this affair will find it if it has to go a mile after it. The boys will not have to sing out, "No bottom, sir," as I have had to do. But then if that bottom was a mile below me it could stay there; I did not need it, and this affair when it comes up off the bottom can be made to bring some of that bottom up with it to show the boys what it is composed of.

She will go first to Southampton, and has thirty-two days to go there in. After leaving there she goes to Cherbourg, France, and from there to the port of Madeira, then home. While lying at these ports the boys get shore liberty and a chance to see all that there is to see.

These boy crews have been making these voyages for years now; a different crew going nearly every time, and I have never seen any complaint of their having tried to take the towns; which speaks well for them; but the regular moral discipline which they are under may have something to do with their not giving the police extra work. At least from what I know of the average boy when he gets as far from home as they do, I think that is the way to account for their not trying to run things, the police included. CABIA BLANCO.

ERIE, Pa.

Fishing.

Gladys Young was fond of fishing,
So she fished from morn till night;
But, to tell the truth about it,
Gladys never had a bite.

Hat awry and cheeks like roses,
Empty basket on her arm,
Told the giggling lads and lassies
No wee fishes came to harm.

"Where's your fish?" they cried in chorus,
"Lovely day!" and "Stream so still!"
Gladys blushed; "I caught but one fish,
And he's climbing up the hill."

Natural History.

Man and the Other Animals.

Editor Forest and Stream:

Your correspondent, I. W. G., fires a lot of questions at me that I have fully answered in my communications. Take as an example the question: "If the mew of a cat is pertinent to this discussion, why is the bawl of a calf impertinent?"

I answered this question fully in the paper from which he quotes so freely. He had claimed that language is inherited and had mentioned the bawl of a frightened calf to prove it. I answered that language is acquired, that the bawl of a calf is not language, only a cry of terror. That most animals, man included, inherit the cry of terror. That these inherited functions were not denied, therefore had no standing in this discussion. As the mew of a cat is not a cry of terror, I claimed it to be a part of the cat language, and therefore it is pertinent to this discussion. It seems to me that anyone whose ideas are not petrified could have found an answer to his query in my paper if he had looked for it.

Proof, proof, is the reiterated cry of I. W. G. But his mind is only open to impossible proof. To show I. W. G.'s peculiar ideas of proof I will quote from his paper: "Hermit tells us that a kitten was taught by the cat to anticipate the approach of a butcher cart by signs made by the cat as she watched by the window. * * * If the cat instructed the kitten in the language of signs, how did she do it? If Hermit affirms that the cat told the kitten beforehand that her ears pointed forward would mean one thing, and when they were pointed back it would mean something else, he should be able to describe definitely the process by which the cat communicates this information."

It is not enough that I, and others, for over three months saw the cat communicate with her kitten every morning by signs. No, the fact is nothing to I. W. G. It must be proved just how, when, and where the cat educated her kitten.

Can he tell us how the human mother educates her child before it learns to talk, that the shake of the head means no and a nod means yes? Can he tell us when a cat arches her back and spits why the dog interprets the sign language to mean "beware of the cat?" I don't believe I. W. G. has devoted any time to the study of such subjects, therefore his answers would be only guess work from memory.

I intended to drop cats from this discussion, but I. W. G. and other writers will not allow the cat question to drop, so I am again tempted to continue. I related the cat story because it struck me as being peculiar, for it was outside of the education which cats give their kittens. I did not explain how the cat taught the kitten sign language, for I thought that anyone with brains enough to write on the subject ought to know how a cat teaches her kitten.

There are cats the world over, and when one weans a kitten any human observer that can reason from cause to effect, can fully understand how the sign language is communicated. The hungry kitten follows the cat. The cat turns and lays its ears back. The kitten persists and gets a severe mauling. This lesson repeated a few times teaches the kitten that when its mother depresses her ears it means "keep away." A cat does not wean her kitten suddenly. The flow of milk will not admit such a method. When the udder is distended the cat will allow the kitten to approach. If the kitten hesitates the mother pricks her ears forward, and the kitten soon learns that the ears pointed forward means "come."

My sister's little girl, a mere child, while her pet kitten was being weaned, offered friendly advice: "Come away, kitty, she's cross." Then at other times: "Go long, kitty, she's clever." This child, without instruction, other than what the cat had afforded, had correctly interpreted the sign language.

I think I stated before that I had observed Mr. Wilson's cat for years. The kitten mentioned in relation to the butcher cart was under my observation every morning from its birth to the day of its death, two years later, with the exception of ten days when I visited St. Louis. I saw just how the cat taught the kitten that pointing the ears forward meant yes, and pointing them backward meant no. It was done largely through the kitten's mistakes. The cat sat on the showcase and watched the approaching carts, and persisted in pointing the ears forward when the right cart came in sight, and backward for the wrong cart. The cat made no mistake, but the kitten did. At first it ran to the door at the rumble of every cart and was called back by the mother. After a while the kitten seemed to understand that its mother was giving it a lesson in sign language, and it made few mistakes. At last it understood fully the meaning of the signs, and did not make a mistake during several months.

I have a way of jotting down my observations, and my note book on this subject is well filled with items, so that I do not depend on my memory; but I. W. G. will not be satisfied with such proof. He wants me to prove that the cat took her kitten in hand and with uplifted paw told the youngster, in the English language, that pointing the ears forward means yes, and that pointing the ears backward means no. His statement, "If Hermit affirms that the cat told her kitten beforehand," etc., covers the line of proof he demands. Now I do not, and did not, affirm that the cat told her kitten anything beforehand. I simply stated facts in relation to the sign language as I saw it from day to day.

I ask for a halt in this discussion until the writers who claim that all functions are hereditary explain themselves. I don't know where a writer stands when he admits that animals have crude ideas and can communicate them to other animals; for biology teaches us that sounds and signs that convey ideas are acquired after birth and not inherited. My belief in acquired functions has been the outcome of a life long observation, and a thorough study of the scientific side of the question. It is supposed that everyone who writes on language by sounds or signs knows that biology gives lessons which cannot be

assailed by assertion, yet there are many writers who are ignorant of, or wholly ignore, this fact.

I. W. G. wants information on the bovine language, whether it is hereditary or acquired. He has answered his own question, for he writes: "It is admitted on all sides that they (the animals) do communicate crude ideas to each other, and this could not be without some sort of a language." If he will turn to biology he will find that all language, no matter how crude, is acquired and not inherited, so he gets his answer when he admits that animals can convey ideas. Now, I have held to observation in presenting this question, only calling attention to the scientific bearing now and then, for the reason that observation reaffirms what science proves. And again, it would be out of place in FOREST AND STREAM to treat of anatomy and physiology. I. W. G. ought to know enough of these studies to answer nearly all the questions he asks. His treatise on "prearranged language" has nothing to do with the question before us. He should examine the animal organism to ascertain how language originated, how signs and sounds came to represent ideas, and to learn if the nervous system that makes language possible is common to man and beast. He should learn how the symbols of words, seen or heard, are located in the brain, then he might make comparisons between human language and brute language. He might possibly feel humiliated when he was brought face to face with the fact that the human animal is not so far above the brute animal after all. He might find that if a kitten's ear drums were destroyed at birth, that it would be just as reasonable to expect that kitten to talk cat language as it would be to expect a child born deaf to talk the human language. He would find that both animals could utter sounds conditioned on the structure of their vocal organs. He would learn that both had tracts in the brain vainly awaiting the symbols of sounds. That these symbols would never be acquired because a sensorial impulse derived from sound can never be sent over the eighth nerve—the auditory nerve—when the nerve has been destroyed from any cause. If I. W. G. will study the nervous system of the higher animals and of man he will be surprised, and might be induced to drop his guess-work on language for solid facts.

M. A. WALTON ("Hermit.")

New York Zoological Park.

THE New York Zoological Society's Park is a pleasant place to visit during the heats of summer. There one may get away from the noise of the city streets, and the sweltering heat of pavements which for a month or more have been absorbing and giving out the sun's rays until there is as much heat given forth from the ground and the walls about us as there is by the sun which blazes down from the sky above. In the Zoological Park there is quiet, green grass, the shade of great forest trees, and often a strong breeze cooled in its passage over the waters of the Sound or of the Hudson.

No matter how often one may visit the park, there is always something new to be seen there; improvements are continually going on, new buildings are being erected, new animals are received and put on exhibition.

During the year 1903, the Lion house has been completed and its occupants installed; the Antelope house has been built and roofed in, while plans are under consideration for the Administration building, which is likely to be the next one constructed.

The Lion house has already been described in FOREST AND STREAM, yet no description can give a satisfactory idea of the beauty and good taste of this edifice, nor of

PRZEWALSKY'S HORSES.
Courtesy N. Y. Zoological Society.

the admirable provisions which exist in it for the comfort of its occupants and those who visit it. The house is large, its total length being 240 feet and its width, including the outside cages, 110 feet. The cages are on the east side of the building, there is a broad space in front of them for those passing through the building, while on the east side is a platform six or eight feet wide along which seats are ranged for the accommodation of those wishing to sit there and watch the animals.

There is now on exhibition a considerable representation of the great cats. There are three or four lions, as many lionesses and two litters of young cubs, of which four were born in December, 1902, and three in March, 1903. The latter, which stand about as high as a good sized fox terrier, are as playful as so many kittens, and devote much of their time to games with each other and with their mother, whom they greatly worry. The other cubs have been taken from their mother and now occupy a cage by themselves. They are more or less solemn creatures, very different in

their demeanor from their younger relatives. All these cubs, of course, still bear the spots with which young lions are always marked, and which indeed may be noticed on the young Senegal lioness about two years old here on exhibition, and on one of the breeding females. The lions are all particularly fat and sleek, and seem to be in the very pink of condition. The large male tiger Rajah, which, with his mate, was presented to the society by Mr. Chas. T. Barney, is, on the other hand, thin in flesh, and his hindquarters seem to lack muscular development. The opening of the outside cages—which are not yet completed—will un-

In England it has quite generally been believed that Przewalsky's horse is a hybrid—a cross between a pony and a certain Asiatic wild ass known as Kiang—and the question has excited much interest and been much debated by British zoologists. Recent experiments by Prof. J. C. Ewart seem to show that this animal has no close relation to the wild asses, and is, in fact, a true horse. In his paper read before the Royal Society of Edinburgh last June, Prof. Ewart says: "Granting Przewalsky's horse is a true wild horse, the question arises: In what way, if any, is it related to our domestic horses? It is still too soon to answer this question; but I venture to

death by the bite of the tsetse fly, which is so certainly destructive to horses and cattle, the zebra has never been domesticated and reared for commercial purposes.

The type species of the Burchell zebra form is reported as probably now extinct, and since in Africa these wild equines are commonly regarded as game, there seems every likelihood that as the country settles up other species will disappear.

The zebras are tremendously stout and sturdy beasts, and seem to be thriving under the conditions of the park. Both the horses and the zebras are kept in small stone or gravel paved paddocks, where no grass grows, and are fed on dry hay. This seems to have been found necessary on account of the deplorable experience had with some of the herbivorous animals, which appear to have found among pasturage of the park the germs of disease which has carried off many of them. The buffalo, the caribou, the moose, and mule deer have all of them suffered from this cause, and the difficulties which have attended keeping the society's herd of antelope alive are well remembered. Happily the society has secured the services of Dr. Harlow Brooks, eminent as a pathologist; Mr. Frank H. Miller, veterinarian, and Dr. W. Reid Blair, D.V.S., whose examinations of sick and dead animals cannot fail to be of the greatest use not only to the New York Zoological Society, but to all other zoological gardens.

While on many accounts the summer is a delightful time to visit the Zoological Park, yet it is not the time for seeing the animals in their best condition. The birds are moulting, many of the highly colored males of the duck family have assumed the plumage of late summer, while animals which in winter commonly bear heavy coats are now likely to be ragged, and not to show up at their best. On the other hand, the young animals which were born in the spring have now attained a considerable growth, and are, for the most part, on view, forming interesting family groups. In the park, for example, at the present time there are besides the families of lion cubs, two of wolves, two of coyotes, some young deer, antelope, fallow deer, wild sheep from the Punjab, aoudad, some young rodents and a number of wild geese and ducks.

The constantly growing popularity of the Society's park is indicated by the attendance for the present year which shows, during the five months from January to May inclusive, an increase of 230,000 or almost double the number of visitors during the same period in the year 1902.

The last—seventh—annual report of the Society recently issued is a handsome illustrated volume of 205 pages. It contains a great amount of interesting information, some of which—Mr. Madison Grant's article on the caribou, for example—has already been referred to in these columns. The reports of the various officials of the Society take up the most of the volume, and there is an extremely interesting article entitled "In the Home of the Giant Tortoise," by Mr. R. H. Beck, which will repay reading. In the report of Mr. Raymond L. Ditmars, Curator of Reptiles, is mentioned an observation which corrects an erroneous idea long prevalent. It has been believed that alligators grow very slowly; Dr. Hugh M. Smith, of the United States Fish Commission, having said in a recent work, "Alligators grow very slowly. At 15 years of age they are only two feet long. A 12-footer may be reasonably supposed to be 75 years of age." In October, 1900, five young alligators were hatched in the reptile house of the Zoological Society, at which time they measured eight inches in length and each weighed 13½ ounces. A year later they were again measured and found to average 18 inches in length and to weigh 9¼ ounces, while in August, 1902, they averaged 23 inches and weighed three pounds each, and on March 5, 1903, they averaged three feet nine inches in length and weighed 14 pounds. Mr. Ditmars believes that the growth of wild alligators must be fully as rapid.

While the growth of the young crocodilians in captivity is seen to be very rapid, the larger alligators also grow more rapidly than would have been supposed. The great specimen named Mose has grown five inches since his arrival at the park in July, 1899. Another specimen which measures at the present time 10 feet and 11 inches, grew during the first year in the park 15 inches in length, during its second year 13½ inches, and during the last year 19½ inches. Mr. Ditmars notes other interesting observations on reptiles.

The paper by Mr. C. Wm. Beebe, Curator of Birds, treats entertainingly of the psychology of birds, and gives interesting examples of the relations existing between the tame birds in the park and the wild ones which approach it in migrations.

The New York Zoological Society, though in a most flourishing condition, greatly needs additional members. Annual membership entails an expense of \$10 a year, in return for which are to be had all the privileges of the Society, including admission to the park on pay days, all the publications of the Society, admission tickets for friends, and the use of the administration building—after that shall have been erected. Every citizen of New York, or New York's vicinity, who can afford it, should be a member of the Society, and should frequently visit its park and the aquarium, which within the year has come under the charge of the New York Zoological Society.

An Early Description of Texas Buffalo.

ONE of the very earliest descriptions of the Texas buffalo is contained in the journal of Fernando del Bosque, under date of May 14, 1675:

"We started, having with us the Indians of the Yoricas and Jeapes, already mentioned, and traveled from the place called San Gregorio Nasianseno for about three leagues toward the north. We reached a watering place in a plain without other trees than mesquite.

"On the same day and in said province and place called San Bisente Ferrer, the Indians and Spaniards killed two buffalo for our people to eat; the form of these animals is very ugly; they resemble bulls and cows; the skin is covered with wool; their shoulders are high, which makes them look humpbacked; they have a short

CRAWSHAY'S ZEBRAS.

doubtedly be of great benefit to all these cats, by giving them more range and opportunity for exercise.

Besides the lions and tigers, there are the male jaguar, which killed the female when they were introduced to each other some months ago; a number of leopards, including a pair of black ones, and one cougar, or mountain lion.

It is remembered that in the lion house a large room has been set aside as a studio, for the use of artists who may desire to work on animals. This room has been fitted up in accordance with the suggestions made by a committee of artists, but precisely how satisfactory it will prove cannot as yet be said.

Of the animals recently received at the society's park

think that should we by and by arrive at the conclusion that our domestic horses have had a multiple origin—have sprung from at least two perfectly distinct sources—we shall probably subsequently come to the further conclusion that our big-headed, big-jointed horses, with well marked chestnuts (callosities) on the hind legs, are more intimately related to the wild horse than the small-headed, slender-limbed varieties without chestnuts on the hind legs; that, in fact, the heavy horses, whether found in Europe, Asia or Africa, and Przewalsky's horse have sprung from the same ancestors."

Two fine specimens of Crawshay's zebra, imported from the Kilimanjaro district of German East Africa by Mr. Carl Hagenbeck, and now four years old, have

BENGAL TIGER RAJAH.

By permission N. Y. Zoological Society.

Perhaps the most interesting are the two Przewalsky horses, which, it will be remembered, many naturalists believe to be the nearest living relative of the domestic horse, and perhaps its ancestor. They are exceedingly horselike in character, and those at the park—now two years old—are about the size of yearling Indian ponies, or perhaps a little larger. They are tan or buckskin in color, with blackish manes and tails, and have a brown or bay dorsal stripe. Of the two, the female is the larger. They give one the impression of great endurance and possibly some speed.

recently been received at the park. This species is a form of Burchell's zebra, and is one of the largest and handsomest of the zebras. It closely resembles the rare mountain zebra of South Africa, being very broadly striped.

It used to be said that the zebras were all untamable, but this statement was long ago shown not to be true. Zebras have frequently been broken to work, and have often been bred in confinement, and it seems rather extraordinary that, in view of the numbers of these animals in South Africa, and their immunity from

neck and their heads are covered with long woolly hair, which hangs over their eyes and interferes with their seeing well. Their horns are short and thick, but like those of a bull; their rump and buttocks are shaped like those of a hog; their forefeet and knees, and from there up until the junction with the shoulders, are covered with long woolly hair, like the beard of a goat. Their tail is naked to near its end, where it has a heavy tuft of hair. The female has four teats. They were about the size of neat cattle; they looked at people in a sidelong way like wild boars."—National Geographic Magazine.

The Carcajou.

BROOKLYN, September 11.—*Editor Forest and Stream:* As to the identity of the carcajou: Audubon, in his "Quadrupeds of North America," places the carcajou as the French Canadian synonym for the wolverine or glut-ton (*Gulo luscus* Linn.), and kuickhatch as the English Canadian synonym for the same animal. He adds: " * * * Carcajou appears to be some Indian name, adapted by the French, and this name has evidently been applied to different species of animals. * * * Charlevoix, in his 'Voyages to America,' Vol. I., p. 201, speaks of ' * * * The carcajou or quineajou, a kind of cat, with a tail so long that he twists it several times around his body, and with a skin of a brownish-red.' He (Charlevoix) then refers to his climbing a tree, where two foxes have driven an elk under the tree; the cat, being on the watch, pounces on it, in a manner ascribed to the wolverine. Here, he evidently alludes to the cougar, as his long tail and color apply to no other animal in our country * * *"

Audubon evidently had never seen a specimen of the quineajou, or kinkajou, from South America, which was so well described (with illustration) in FOREST AND STREAM early last spring. Moreover, I do not think, from its size and habits, that the kinkajou would ever meditate an attack on any living animal the size of an elk. There is an excellent specimen from northern South America, I think, at the Bronx Zoo.

J. K. HAND.

[Not much confidence can be placed in the natural history of Charlevoix, as is shown by his statement that two foxes drove an elk under a tree. He confused the names carcajou and kinkajou, the latter an animal about the size of a domestic cat. For many years carcajou has been used only for the wolverine, *Gulo*. Who can tell what animal it is that the Indians call weazle bear?]

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Nebraska Game Fields.

SINCE I have been writing for the FOREST AND STREAM and giving away the secrets of Nebraska's grand hunting grounds I have received so many inquiring letters from sportsmen abroad, especially from the larger eastern cities, that I sometimes think that I have made a mistake in thus advertising these good things to the world. By a little ingenuity the reader could have been misled as to locality without impairing the interest in the story, and thus insured, for years to come, to myself and local sportsmen alone, the rare enjoyment that is so plentifully accessible to us. That there will be more foreign hunters visit Nebraska during the present season than ever before, the inquiring letters I have received bear ample testimony, and in the long run it will be all right. He is a poor sportsman, indeed, who is not willing, in a measure, to share the goods that are so bountifully his with his less favored but just as enthusiastic brethren from abroad. If they are willing to subserve our laws, and pay for the morsels we have to offer, all well and good. He should be welcome to them. So let them come—the more the merrier, and so far as I am personally concerned they will find me both conscientious and truthful in my advice and guidance.

In reply to a bunch of inquiries which I cannot even hope to answer individually by mail, with reference to chicken and wildfowl shooting in Nebraska and surrounding States, I will say that in this State a non-resident license of \$10 is assessed and 50 birds permissible per gun per day, and 50 birds can be carried or shipped out of the State when accompanied by the man who killed them. The open season begins here on October 1 for chicken and November 1 for quail. On wildfowl and waders the open season began September 1. In South Dakota a \$10 non-resident fee is charged, and but 15 birds are allowed per gun a day, and 50 birds can be carried from the State. This fall the crop of birds is said to be very large, and the shooting prime almost anywhere. The season opened September 1, as it did in Iowa. In the latter State the non-resident license is \$10 for each county, 25 birds to a gun per diem, but none can be taken out of the State. The quail law in Iowa is up November 1.

I notice in the reports of Nebraska's late field trials several of the writers complain of the scarcity of chickens on the grounds, and why shouldn't they have been scarce after half a hundred men and two or three hundred dogs have been ravaging the country for miles around for months previous to the trials? The fact is the birds were literally driven away from the locality long before the trials opened. Holt county, and particularly roundabout O'Neill, where the late competitions were held, has always been a famous chicken country, and the birds left over last fall were abundantly numerous to insure a great crop this season.

And so far as all the chicken country in this State is concerned, the present year has been and is still a wondrously favorable one for the birds, and the field has been a tremendously large one. The past winter was just the right sort of texture to presage good things in the way of bird increase throughout the summer. While the weather has been especially hard on the agriculturalist, it has been superb for the grouse family. Small grains have suffered much, and it was feared that the

corn would fall woefully short, but later developments show that it will not. However, be this as it may, the chickens everywhere in chicken country are thrifty and plentiful. The early spring and summer could not have been more propitious for breeding, and up to very recently the favorable conditions continued to prevail until now it is too late for any serious results from meteorological influences. Right after the hatching of the chicks there was a considerable spell of nice dry weather, in which they thrive and grew famously, gaining such size and a capacity for protecting themselves that they have suffered comparatively little from the recent terrific rain-falls. Owing to our new game laws, and the better sentiment prevailing among a large preponderance of sportsmen, there was a much larger number of birds left over last fall than usual, and now from all the wild and untrammelled localities come reports of the remarkable plentitude of birds. That they will ever again be restored to our limitless prairies in anything like their old day swarms is a fact patent to all sportsmen familiar with the possibilities of the bird. Neither is the present pleasing increase to be continued for many years, except in the most remote and inaccessible regions. The condition of things is such as to absolutely prohibit anything but a temporary thrift on the part of these most royal game birds.

The prairie chicken is a bird that thrives and multiplies with the first stage of civilization; stands still at the second stage, and fades away forever with the third. The third stage is now rapidly possessing this great State of ours.

Despite the fact that the law does not permit the killing of these birds this year until October 1, and despite the fact that we have a corps of active game wardens patrolling the chicken districts, the killing has been going on almost everywhere, but by no means as extensively as of yore. That the constitutionality of the present statute governing the matter is now being tested by certain malefactors, will in nowise lessen the activity of the wardens, and sportsmen everywhere anxious to get in the field are warned to keep within the bounds of the law as it reads. October 1 is plenty early enough to commence killing chickens in Nebraska, notwithstanding the claims of those who would like to exterminate the birds before they are strong enough to lift themselves out of the tall grass.

All we have to do is to curb our patience. We are promised great sport this autumn—sport which, in many places, may approximate that which was so generously showered upon the gunners of former generations. Surely no bird ever lent a greater charm to its environments than the chicken to Nebraska's broad prairies, yucca-covered sandhills, fertile valleys, and sunflowered fields. It has been and is to these more than the rose-wood quail is to the wheat stubble, the cornfield, and lingly creek's bottom, or the tinkling upland plover to the big pastures, the mystic jack to the bog and damp meadows. It is what the Canada goose is to the long barren bars of the Platte, and the mallard and the red-head to the marsh and the rice beds. Without it our great plains would lose more than half their enchantment, and were it not for the never ceasing "chip-chip-chip-dee-tee-tee" of the song sparrow and the piccolo of the meadow lark, they would relapse, indeed, into a lifeless expanse, a fitting home for the skunk, the badger, and the coyote. No sound ever stirred more thrilling sensations within the sportsman's thoracic department than the far-reaching "boo-oom! boo-oom! oom! oom-m-m-m" of an old cock swelling from the distant hillside or cottonwood barricade before the faint azure of the liverwort beams beside the soggy and bedraggled snow-bank in the shade of blow-out or draw, or the bright face of the sweet clotonia lights of the scrawl of the burnt prairie.

When the mallards and the widgeon have departed from the frozen marsh when Bob White has fled to the matted towheads for protection from the wintry blast, when the yellow vest of the meadowlark no longer flashes amid the brown verdure of the plain, and when the resonant "auh-unk! auh-unk!" of the wild goose southward bound, grazing the gauzy clouds with his ashen sails far above your head, is the only sound of all the medley of game life in the melancholy autumn time, then the prairie chicken is the only companion, save the ever frowsy wolf remaining for the wayfarer of the prairie!

But what I have said of the plentifulness of the chicken will also hold good with the quail. The three years' prohibitive period which ends with the last day of October, has resulted in a very decided recuperation in the ranks of this precious little game bird. The past season, especially, has been the most favorable for years, although the winter was severe and many were destroyed by the cold and heavy snows. This summer, however, the conditions have been extremely propitious for fecundation among the birds. The whole trysting, laying and hatching season was an unbroken stretch of exquisite weather, with no continued drouths or excessive rainy periods, but of uniform temperature and general conditions particularly adapted for the purposes of nidification. That they did not allow the golden opportunity to pass unimproved is attested by their unprecedented plentifulness this fall. Almost every stubble field holds its bevy, and more birds are to be found along the Missouri, Platte, Elkhorn, Loup, Rawhide, Republican and Niobrara Valleys than there has been in a quarter of a century. To be sure, the late prodigious rains may have destroyed a good many birds, but the number will prove comparatively small to what it would have been had they come a month earlier. The chicks are now full grown, the most of them, and well prepared to protect themselves against excessive dampness, and the loss has not been so great, probably, as one might expect.

But as the season stands, now is the time to begin to enjoy, at least, the full fruition of the happiness a ramble over the fields and in the woods affords. Whether it be in eager pursuit of lagging plover, turtledove, or young duck, or in the simpler study of the character of the early autumn time, in breathing the invigorating air, with its suspicion of frost, or in merely seeking a temporary relaxation from business cares, the glorious month of September yields an appreciable reward which no other month, save the always peerless October, affords. The true hunter's idyl.

But what a shame it is that pessimists should endeavor

to excite our mistrust in nature and put dangerous knowledge in our heads which could only have ripened on the tree of evil. Yet only yesterday I ran across a column and a half of merciless type in an alleged sportsman's magazine which warned our September ramblers of woods and fields of poison in the fall blossoms. Almost every flower in my long category of favorites seems to have some taint or bane; the buttercup, the anemone, hellebore, poppy, laburnum, bryony, parsley, nightshade, foxglove, ambrosia, the spurge, sorrel, smart and ragweed, goldenrod, and even the dear old-fashioned sunflower is not exempt. What a queer lot of scientists the world is producing. Their one aim seems to be to make life miserable.

SANDY GRISWOLD.

Wanted: Moral Courage.

SAN FRANCISCO, September 4.—*Editor Forest and Stream:* A short time ago I directed a letter of some length to you anent the unreasonable slaughter of game in Colorado and California. Though there has been very much written and printed about the subject, it seems that no matter what is uttered, either in ink or by word of mouth, the slaughter will continue. Perhaps, in time, the utterances and publications against the nefarious practices and indulgences will have some effect, and public opinion will shame and awe the game-hog into decency. So far it appears that the latter is immune to all scoldings, reprimands or lectures. Perseverance, however, may result in good, and the doctrine of game protection may be sown upon fertile ground and take root, with results of good to all concerned, brute as well as human animal. And it is high time that the gospel of game protection be made a tenet of the everyday life of every good citizen, and that the same be constantly preached, so that the just and unjust may hear alike. The just and innocent will not be offended; the unjust and guilty may have their consciences awakened. But there is really more than this matter of ethics involved. It is a matter of moral courage—moral courage to see that the law be enforced.

The other day I read in a California paper of instances where the prevailing game laws were ruthlessly violated, but, the paper stated, no one seemed to care to file the information with the proper authorities for prosecution. There's the whole fault or weakness in a nutshell. The parties who had knowledge of the violations of the law—call it crime, misdemeanor or felony—none were willing to go before the court and bear witness against the offender! *We lack moral courage.* I ignominiously confess to that weakness myself. That's a degrading confession, all right, I admit, but why did I show such weakness? Simply because I got no support in my fight against the transgressors from those who should be in sympathy with me. It was probably on the basis of that old obnoxious truth that "what is everybody's business is nobody's business." I incurred the enmity of the man I sought to bring to justice, and was denounced as "a d—d fool" by others for having made the attempt. That is human nature, as illustrated in America, when it comes to one's attempting to have game properly protected.

As intimated before, perhaps time and the "everlasting-keeping-at-it" idea will have potent effect. I wish to say here, however, that FOREST AND STREAM is entitled to sincere and unlimited lapdation for the space it gives to these complaints and agitation. I feel, in this matter, that if you and all other publications interested will keep up the agitation for more strict observation of all game laws, something will turn up, as it did for one of the two frogs who unwittingly jumped into the can of milk—something is bound to turn up if we keep a-kicking. Apropos of all the foregoing I would like to quote the following from the Victoria (B. C.) Daily Colonist of August 26 last:

"Arrivals in Victoria from the Comox district have some decidedly interesting stories to tell of the strange state of affairs which has for some time past existed in that quarter owing to the conduct of the wandering bands of striking coal miners, who have taken the Comox Valley as their especial camping ground, and have been carrying things with a rather high hand.

Soon after the labor troubles began at Cumberland, parties of the colliers were noted roving over the fertile farm lands of the Comox Valley, each member of the parties armed with a shotgun or rifle. While they were ostensibly after game, they displayed a catholicity of taste which enabled them to include in their bag such small deer as prize milch kine, imported cattle, and even valuable horses. The poultry, of course, stood a still poorer show of escape, and many a fine collection of fowl was decimated.

"Naturally enough the farmers objected, but they were quickly informed that it would be worth their while to keep their mouths shut, as the man that informed would have a short and stormy experience of life after the information was laid. Indeed, one farmer who declared that he would certainly inform and claim protection from the law, was warned that if he did so his life would not be worth an hour's purchase. He did not inform, although his loss was heavy and hard to be borne.

"As a consequence of the depredations of those visitors from Cumberland," said one gentleman in an interview last night with the Colonist, it is almost impossible to find a game bird within many miles of the Comox Valley, so thorough have been the murderous operations of the striking miners. They have now gone back to work, but they have wrought irreparable damage to that region, for it will be years before the shooting will be worth anything. Formerly that valley was famed far and wide for the plentifulness and variety of its game. The feeling in the valley is very bitter against the marauders."

Careful inquiries have been made by the Colonist in the quarters supposed to be the best informed on the subject, and it is greatly to be regretted that there seems to be a unanimity of opinion there that the prospects for the sportsman on the first of September are none of the brightest. Reports from all the surrounding districts are in agreement in declaring that, owing to the unrestrained ravages of the unlawful hunters for months past, there will certainly be a serious shortage in the number of game birds, and those that may be encountered will be so wild that success will be exceedingly hard to attain.

"Farmers, country gentlemen, officials of the Government who have visited the country, all express their indignation at the wanton slaughter which has been going on everywhere by persons who seem to have the utmost confidence that they will not be caught and punished, and the utmost contempt for the law.

"In some districts so serious has been the slaughter of the young game that hardly a bird is to be seen in the course of a whole day's march. Ready sale for the game thus killed is found in Victoria, where enormous quantities are regularly disposed of. Those persons who thus anticipated the opening of the game season were heartlessly cruel in their operations; it was not only the parent birds that were massacred, but in many instances the entire brood, too young even to tempt the appetite of a starving cat. They seemed to be killed just for the delight of slaughter.

"Stories innumerable are also told of the intolerable insolence of these lawless armed banditti, who in not a few instances turned upon the farmer or proprietor of the land on which they were trespassing and threatened to blow his head off if he said another word. The marvel seems to be that no conflicts with serious or even fatal consequences have ensued.

"It is not only near Victoria that this extraordinary state of things has been going on, but from distant parts of the island and mainland come the same stories. From all these reports it would appear as if the provincial sportsmen who have waited patiently for the opening of the season according to law, will have somewhat poor results for their tramps through the neighboring woods."

It would appear from the foregoing excerpt that the offenders in this instance were not that class of so-called sportsmen who could buy immunity because of their wealth from any violation of the law, but, on the other hand, were persons who felt themselves without any restraint from the law, and were making the most of their freedom. Ignorance may be a more charitable excuse for them, and missionary work, with tracts as to the rights of game and animals, is probably the medium to avoid their committing repetition of their lawlessness.

British Columbia as well as most of the rest of British North America has been looked upon as a vast national game preserve, to be a *dernier resort* for the sportsman when the United States is teetotally played out. But the game-hog and market-hunter are evidently very much in evidence there, too; so much so that the press finds it necessary to voice a protest. The Victoria paper says editorially:

"On several occasions lately representatives of the Colonist have been spoken to by visitors from various parts of the country in regard to the violations of the game act which are now creating so much bitter complaint. The ground taken by those gentlemen is that it is useless to try to enforce the provisions of the game act in the country if the storekeepers and restaurateurs, hotel keepers and others in the large cities and towns are quite willing to handle the unlawful produce brought to them for sale by the poachers.

"That this practice goes on at the present time to an extent that may surprise a good many people is a fact. As one protester put it: 'There is no exaggeration in saying that game of almost every kind is brought to the city every month of the year, is readily bought up at prices that appear to be satisfactory enough to the hunters, seeing that the traffic increases rather than diminishes every year, and is as regularly served to the public who may call for game, be the month what it may.'

"It is notorious that in some restaurants in Victoria, game may be had at almost any time of the year by anyone who wishes to call for it. Those establishments seem to pride themselves on the fact that they can supply such orders. Something like the famous Palmer House of Chicago, whose boast it was, and is, that nothing on its yard-long bill of fare can be called for that it cannot supply. There is no such thing as asking for something on the bill of fare and being told that it is just 'off.' So it is in some of our local restaurants and hotels; it is not possible to catch them without game on request.

"In the opinion of those who have made a study of this urgent matter, there is only one way to stop the infractions of the game act, and that is to make it unprofitable in such manner as the law may devise, for any person to supply game out of season in a restaurant or hotel."

A correspondent in comment says:

"During the past five years I have endeavored to get some members of the Legislature to have the Government amend the game act similar to the Ontario game laws, which provide that hunters must take out a license costing \$2.50 each year. Along with this license is issued two tags, which entitle the holder to kill and transport two deer in the open season, each deer so killed to have a tag attached before any transportation company can carry the carcass on any conveyance whatever under a heavy penalty. I think it would be highly in the interest of British Columbia to have the game act amended like the following: Gun license, \$2.50. Number of deer to be killed by any one person during open season, 6. Number of grouse, 50; pheasants, 6; elk, 2; caribou, 2; moose, 2; mountain sheep, 4; and any other kind of animals added that are likely to become extinct. I am sure no true sportsman would object to paying the small sum of \$2.50 for the privilege of finding some game when he chooses to look for it. Besides, it would effectually put a stop to so much pot-hunting as is now carried on. I know one man who, about four years ago, killed and shipped to Victoria 125 deer in three months and a half, selling some for fifty cents each. I also know some members of a certain gun club killing over 100 grouse in one day. Such slaughter as that is not sport. Then again, is it fair that a miner should have to pay \$5 for a license to hunt for mineral, while the game of the Province can be hunted with impunity by anyone who chooses to buy some powder and shot? I think if the fish and game clubs would devote some of their energies in the direction I have mentioned, the trouble could soon be overcome. The money so collected from licenses would go quite a way toward paying for police protection during the close season."

The swell restaurants and big hotels of large cities are, by their character, perhaps incentives to violations of game laws, but there are also probably some mitigating

circumstances in which they are not such black devils as they are painted in that respect. Those institutions cater to people who have appetites or cravings that they want satisfied or gratified at any cost—price is no object. There are some people who want venison or some sort of game every day—the ordinary beef, poultry, pork or mutton being too plebeian for their epicurean palates. The difference in the time of close or open seasons in different States would make it possible for these establishments to have game on their bills of fare, by importation, when it was "out of season" in the State where the hotel or restaurant is located. Cold storage plants can also make the "game in season" phrase perennial.

And there need be no necessity of the chefs passing off "delicate young ram cats" for wild rabbits or hares, nor for offering young crows for partridges, nor for tying long wooden bills on sparrows for imitation snipe. It is easy to pass young guinea fowl, young covies, young peafowl, squab, capons, young turkeys, kids, lamb and veal for game and venison, but I would prefer them under their true colors without the sauce and tag of deception. Still, it is the province of swell hotels and restaurants to cater to the appetites of their customers, and if I get "game hungry" at the wrong time of year I ought not to blame the cook if he appeases my appetite with a clever "mock" or imitation. Most sardines are not sardines, but how many people know the difference? Barnyard fowl may be fed and fattened so as to give their flesh a game flavor, further enhanced by dressing or curing, and by appropriate cooking. If the diner mistakes a ducklet, turklet, cockerel or gosling for teal, quail or frog, or a piglet for a 'possum, what is the difference, so long that he is blissful in his ignorance, and the check or chit calls for the figures or price of the real thing?

But seriously, as a matter of fact, there is no dire menace to game, even if hotels and restaurants are permitted to have game and venison in their menus, provided the laws are carried out strictly and relentlessly as to the amount of game any hunter may kill. Most hotels and restaurants know who their customers are, and serve game without fear of being "peached" upon. Open permission to serve game might be met in return with honest observance of the law, and in order to give customers a taste of game once in a while game could be reserved for the menus of Sundays and holidays, and not on week or ordinary days. I think that with the enforcement of proper game laws, there is not so much to fear from the hotels or restaurants as there is at any time from the game-hog, the poacher, and the out-of-season killer, or "sooner." The danger to game is from the man who hunts in an effort to make hunting a lucrative employment or occupation, and the one who kills and finds his enjoyment in the number of pieces brought down, and of course the one who kills regardless of close seasons.

Our legislation has not always been the wisest, and sometimes the laws of one State have been a detriment to it while the same favored commerce in an adjoining State, and sometimes it looks as if there was collusion. Laws that ostensibly were of a high moral principle sometimes are really viciously ulterior. Take, for instance, the matter of prohibition in Iowa, Kansas, and Nebraska. It forced out the brewing industry from those States and they lost thereby much revenue directly and indirectly, while at the same time there has always been a large quantity of liquor consumed in those States. The effect was to benefit the breweries of St. Louis and Milwaukee by killing off the competition they might have had from the incipient brewing interests in Iowa, Kansas, and Nebraska. This statement may be challenged, but it is a reasonable proposition that financially, if not morally, those three States have been the losers by their past prohibition laws. Game laws sometimes work the same way. A law that bars non-residents from its State deprives its own people from incomes and revenues, and yet may not protect its own game. It may keep out the outsiders, but permitting game to be shipped, encourages market-hunting and illegal killing, demoralizing its own shooting or fishing community. States like Iowa and Illinois, where there is no large game, nor any public domain, may have very strict laws without hurting themselves, or they may have very lax laws and do themselves neither harm nor good, but the commission houses in Chicago may drain all the rest of the States of their surplus game for the trade and traffic to be derived therefrom, to the detriment of some of those States. Game law legislation needs to be broad, deep, comprehensive, and yet on a simple and common sense basis. There is a complaint from nearly everywhere that there is already too much law-making covering every phase of criminal, political and civic life, and in some States there has been very much legislation, as affecting game and fish, without being effective for good. Laws are passed in one session that must be changed in the next, but to a man up a tree it looks as if game and the gentleman sportsman "gets it in the neck" instead of the law-breaker being given his just desserts. Sometimes the game laws are taken up in the Legislatures as a filibustering measure to retard or obstruct other matters, and while the legislators are seemingly struggling in dead earnest for the welfare of our wild, dumb brute friends, it is a bluff and a blind, and more than likely some game dealer finds a loophole left open for him by which he can escape responsibility for infractions. The flaws and weak points of the new law are commented upon by the daily newspapers, the shooting and fishing clubs pass resolutions of denouncement, and we write letters of indignation to the organs of our craft, and after all we never seem "to get there." Meanwhile Bre'r Rabbit, Miss Turtle Dove, Quack, Honka, Bob White, Curlew, Mazama, Lightfoot, Velvet-horn, and Moss Cropper all wonder why they don't get better protection.

As shown in my previous letter, the tuna fishing in California seawaters is already jeopardized, and there is complaint that the abalones are also threatened with extinction. This year some of the northwestern waters have shown an alarming decrease in the usual spring and summer runs of salmon. The scandalous waste of salmon is a notorious fact on the Pacific Coast. Sacramento River ran as high as 200,000 cases in a year. It has dwindled down gradually but steadily to a measly paltry 15,000 cases a season, and the probabilities of a future betterment are precarious and uncertain. The diminution in some of the northern waters has been so marked this year that there is consternation among the canners, and

relief is asked for through artificial propagation in hatcheries.

Reports from the Atlantic Coast would indicate that the peerless lobster is getting beautifully less, and it is also apparent that the popular cod has been about fished out. And I presume the same thing has happened to the diamond-backed terrapin.

So rapid is the decrease in game when once it starts on decimation through the vandal, iconoclastic, destructive hand of man, that the decline in the United States is almost dramatic and startling. The passing of the passenger pigeon, bison and antelope, and the growing rarity of the bighorn are sad examples. Wild turkeys have disappeared from some States altogether. There are lakes in the Rocky, Sierra and Cascade mountains that were the home of rare trout—the golden of Twin Lakes being one of them—that are either extinct or of such few number now as to be the next thing to it. Swans and whooping cranes, once plentiful in certain localities, are not seen at all there now. Even the land terrapin is disappearing from the Mojave desert, and patriotism is not saving the eagle from impending extinction. "Sooners" have lately been detected killing pheasants so comparatively recently introduced into Oregon, Washington and British Columbia.

Time was when quahogs in Puget Sound between Seattle and Tacoma grew as big as coconuts, their shells sticking out like the ears on a man's head, and they had necks like rubber garden hose; they were the real article in rubber-necking, squirting and singing; but they were so fat and tender that they had to be cut up into steaks! But the farmers took to feeding these luscious clams to their hogs, and it's a much smaller clam that they use at the clambakes at Port Townsend and Olympia nowadays. Once the sweet-meated Golden Gate crab attained a size of two feet square; now, while still abundant in San Francisco, they are seldom seen above ten inches!

Even the harmless, useful, poetical, musical bullfrog needs protection, for I hear complaints that this choice tidbit is getting scarce in places where once they existed in myriads.

There is, perhaps, some show of the rabbit or hare getting some recognition as an animal entitled to humane consideration, and it is to be hoped that the cruel, cold-blooded rabbit drives in the West are now a thing of the past. Bunny was rounded up in these drives and a gala day made of the event when the rabbits were to be slaughtered—aye, murdered, massacred, ambushed, assassinated by a howling mob of men and boys armed with sticks, stones and clubs. Over in Oregon the wild rabbits are caught and delivered alive at a rabbit abattoir, humanely killed, and then packed in tin cans for export. Boiled Australian rabbit in tins has already found a good market in British Columbia and Alaska. Belgian hares sell at the stalls in San Francisco markets at from 50 cents to \$1 each, and compared with a seasonable jack or cottontail, I think the comparison is in favor of the latter, and if Belgian hares, slaughtered and dressed, command a fancy price at the butchers' stalls, it seems to me that the wild animal ought to be more in demand, and this wholesale slaughter, just to get him out of the way, to cease. True, the rabbit is prone to multiply, and if let alone might become a nuisance, as he did in Australia. But in this country, with the price of meats from farm animals at their present figures, there ought to be a good and steady demand for rabbit meat in competition to beef, pork and mutton.

And one more word before I close. I notice the fish dynamiter is getting ubiquitous. He is the most detestable and depraved of all game destroyers. The following from the Everett, Wash., Record depicts him in these terms:

"A man who will fish with dynamite is utterly 'ornery.' He would pick pockets if he had enough of the elements of manhood to be nerry, and chicken stealing is his long suit. The dynamiter is a relic of barbarism, worse than the Indian, a coward, a hog, a wanton destroyer of life, and without the faintest notion of good citizenship."

That's a fierce denouncement, but is it not deserved?

WM. FITZMUGGINS.

Pheasants in New York.

For the second time in a decade Major W. A. Wadsworth, of Geneseo, has liberated a big brood of pheasants, with a view of restocking the fertile fields of the Genesee Valley with the same which once teemed in its hills and woods. The first stock numbered 1,500 birds, and they were let go to the wild in 1891. The second freeing, that of June 2 to July 4, this year, sent 3,500 sturdy young birds into the open. Besides these pheasants, Major Wadsworth, aided by George Bleistein, of Buffalo, and the Fall Brook Sportsmen's Club, has freed several hundred quail. These birds are protected by law until 1905, and it is expected that by that time their numbers will have increased enormously.

The Genesee Valley was originally well filled naturally with game birds, such as partridges, woodcock, snipe and quail. In 1888 the sportsmen began to see that the unrestrained banging of green hunters from the city and villages had practically shot out all of the game birds from Portage to the rapids at Rochester. Major Wadsworth, whose devotion to sports of all kinds has been recognized as one of his most noticeable characteristics, decided that the only way to save the valley from total denudation was to restock it. He consequently employed a skilled English gamekeeper, and under his advice imported a large number of quail from Kansas and Mongolian pheasants from Oregon. These birds were set to breeding, and a year later he set free his first batch of pheasants. These birds soon accommodated themselves to their surroundings, and penetrated all through western New York, to the surprise of many a farmer, who was puzzled to decide what kind of a bird it was he saw in the pasture lot. The wideness with which the birds have ranged is seen by the fact that only the other day a flock of pheasants was discovered in the fields north of Webster, in the upper part of Monroe county, fifty miles distant.

In 1898 George Bleistein liberated about 500 quail on the east and west banks of the Genesee. They were Kansas and Nebraska birds, and, according to all reports, have thrived well. Several of the winters have been excessively severe, however, and the birds had a hard time

of it. Their state was somewhat mitigated, however, by the thoughtfulness of the members of the Fall Brook Club, who scattered many bushels of corn where the birds could get at it. The little fellows flocked around these feeding places by the hundreds, and became tame and approachable, and few of them died. It is probable that each year young birds will be liberated in various numbers, and in another five years the valley, it is hoped, will once more be stocked.

The breeding pens of the pheasants are kept filled with old birds, the proportion being 40 hens to 16 cocks, divided up into 16 pens. Each hen can be depended on to lay about forty eggs a year. These eggs are hatched under ordinary hens, the pheasant hen refusing to set in captivity. If possible, bantam hens are used, as they do not injure the young birds by clumsiness. The young pheasants are hardy youngsters and can care for themselves in four or five weeks after hatching. They are fed on ordinary chicken provender. Major Wadsworth's birds at present are half English and half Oregon in numbers. The latter birds are larger and sleeker than their English cousins.—New York Tribune.

Maine Summ'r Deer Killers Fined.

THE Maine Commissioners, having been informed that deer had been killed out of season at the camps of A. B. Douglass, at Deer Pond, in the Dead River region, dispatched a detective to the camp on September 1. At Eustis the detective fell in with Geo. Wood, from North Anson, who was going to Deer Pond. Anson told the detective that he was a guide and could give him lots of fun. As the detective tells the story, this is what happened: "On the way to Deer Pond, when about four miles from Eustis, Geo. Wood said: 'We have got a deer up here a little way, and we will show you some fun.' We all got off. Fred Berry took a bag from the buckboard and we started into the bushes. Berry said: 'I will show you where it is and then go back and watch, and if I see anyone I will whistle.' Berry led us to a spot where lay a disemboweled fawn deer, a little spotted one, which he told me he had shot the afternoon previous while coming out from camp, saying, 'I don't allow them to stand and blat at me.' Wood put the hindquarters in the bag, carried them to the buckboard and put them under the seat. At the camp, Gus Douglass carried the bag into the house and we had venison steaks for dinner. Gus Douglass introduced me to Dr. C. B. Parker, of Brooklyn, who told me of his seventeen years' acquaintance with Mr. Douglass, and of his hospitality and ability as a guide. We talked about the opportunities to get deer and partridge. The Doctor said there was plenty, but we must be careful and not get caught at it, and went on to tell how to manage, saying: 'When there is need of meat in the camp you will know it. Then if you get a deer, leave it right in the woods and let Gus know and he will take care of it.' Gus Douglass and I had a chat regarding shooting deer. He said: 'There is very little trouble here. Of course, we do not mean to waste the game, but so long as we get only what we need in the camp, there is no trouble.' I asked him if it would be safe for me to shoot a deer; that I did not want to get to jail while in Maine. He thought by using caution I would be all right; that if a deer or partridge bit and abused me, I must not come to him with any complaint. To-night Gus and the Doctor have gone out on the road toward 'King and Bartlett.' Gus has a bag and probably they have gone after venison. Waited for their return until 11 o'clock, but did not see them. We had partridge for supper.

"The Doctor and family are getting ready to go home. We had deer meat for breakfast this morning and again this noon. This afternoon Gus and a guest started out on a trip, to be gone over night. They have no guns in sight, but Gus carries a bag which I am satisfied contains a gun. Before they went, George Wood said to Gus in my presence: 'I have told Mr. Leighton that if we get a deer this afternoon you will take care of it all right. I wanted Mr. Leighton to know that what I tell him is all right with you.' Mr. Douglass then said, 'Yes, what you do will be all right. If you get a deer hang it up, say nothing, only let me know where it is and I will take care of it. Be careful.'

Upon receipt of this information by the Commissioners, a warden was sent after Dr. Parker, but he had left for home before the warden arrived. Douglass, Berry and the others were arrested. Douglass pleaded guilty on two counts, and paid a fine of \$100. Two others are held over him for future good behavior. Berry turned State's evidence and was fined \$50. A Harvard student implicated in the killing was fined, but appealed, and after the appeal the case against him was dismissed at the instance of the Commissioner.

He Brought in the Bear.

N. A. KUHN, who has just returned from a trip through Colorado, tells an interesting story of an adventure with a bear by F. D. Wead, who accompanied Mr. Kuhn on his trip. Wead had always had a longing to shoot a bear, and his desire being known to Kuhn, the latter notified the hotel proprietor at Steamboat Springs a week before their arrival to prepare for a bear hunt.

The hotel man had a pet bear which he kept at the hotel. Every night for a week the hotel man took the bear up to the top of a nearby mountain and tied him to a tree. In the morning he released him and the bear, being hungry, started on the dead run down the mountain side to the hotel for breakfast. After this had been kept up for a week the bear learned his part pretty well.

When Wead arrived he was told to prepare for a bear hunt the following morning. During the night his stock of cartridges were replaced with blanks. In the morning Wead started up the mountain and, at a given signal, the bear was released. When Wead saw the animal coming down the path headed straight for him, he blazed away with his gun a half dozen times, and then, seeing that his shots had no effect, he dropped his gun and fled, with the unsuspecting bear, intent on breakfast, following at his heels.

Wead won by a neck, and tried to claim the bear, insisting that he was responsible for bringing him down to the hotel.—Omaha Daily News.

Sentries and Black Cartridges.

Editor Forest and Stream:

The editor in the current number notices that affair at Fort H. G. Wright, where Private Price shot a sergeant with what he thought was a blank cartridge, and his remarks on the subject fit it exactly. There is nothing in the regulations that will warrant an officer in giving a command to shoot a man, even if he is a prisoner; and most officers are careful not to give any such order. They may tell a sentry "if that prisoner tries to escape, fire at him." Then the sentry will most likely fire a mile above the prisoner's head, not at it. The fact that he has fired clears him; he won't generally have to suffer if his prisoner escapes him.

When acting as sergeant of the guard I have taken the gun out of the sentry's hand and fired at an escaping man myself; the ball went close enough to him to stop him; that is what I meant it to do; but I would never tell a sentry to fire.

This sergeant was not even a prisoner, though, and no one, except the man who shot him, will ever know whether that ball cartridge was put in the gun for a blank or not.

These sergeants often get the ill will of some men, and that man may have put in that loaded cartridge. I don't say he did do it; but he may have done it, just to shoot that sergeant; he had an excuse now for doing it—an officer had told him to fire.

Blank cartridges have only been given to men on guard within the past few years. I never saw any of them. We only used them at a funeral. Why the guard should have them I do not know; they cannot stop an escaping prisoner with them. I think that probably the officer who gave that order was a young one. He will learn more as he grows older. They all do.

CABIA BLANCO.

Washington Game Law Decision.

MYERS FALLS, Wash.—*Editor Forest and Stream:* The Superior Court of Spokane county, Washington, Judge Belt presiding, has just declared the game law of the Legislature of 1903 unconstitutional. The State game law of 1901 met a similar fate. His honor pronounced the law "wonderfully and fearfully made." That is, it was badly made, or it was no law at all. It is to be regretted that the people elect so many men to legislatures who are adapted neither by education nor training in the important and difficult matter of making laws. These blacksmith legislators seem to rush in "where angels fear to tread." While very few good angels participate in law-making, it would seem that fewer botches or law-making butchers should tamper with subjects for which they have neither ability nor experience. Too many men with more conceit than sense manage to get into positions which should be occupied by citizens who know something about the matters entrusted to their care. These incompetents expose their own ignorance, bring their State into disrepute, and inflict damage on valuable interests.

I wish to suggest that some game association should prepare a law for those States in which the task is left to so many blunderers. It is not enough that law makers shall mean well. They should know what to do. Every State has a law library and it would not take a competent committee from a game association long to frame a law that would "hold water" and meet the respect of courts and citizens. The draft of such a measure could be sent to someone who would attend to its enactment, and in this way our game would not be exposed to extermination while suitable laws are being put upon the statute books. Is this not a practicable suggestion? A foolish State pride should not intervene in accepting a well digested measure of this kind.

A. MEACHEN.

Flaking Woodchucks.

PLAINFIELD, Mass.—Old sportsmen have long been up to the knack of "barking" squirrels; that is, of killing them by percussion of a chip cut by a close rifle ball out of the trunk or limb to which they are clinging, thus saving unsightly mutilation. But a similar practice applied to woodchucks is new. It was recently introduced to the profession in this wise: Capt. E. A. Atkins, an ex-member of the Legislature, and a prominent G. A. R. man, was a pretty good rifle shot in his day. During or after the Civil War he brought home from Tennessee a Sharpe's rifle which a guerilla of the period had no further use for at the time, and has since put it into occasional service in target practice and turkey shoots. The other day he spied a woodchuck sitting bolt upright on the little mound at the mouth of his burrow, as his relatives, the prairie dogs, do, and placed a ball square on his left jaw at 200 yards. His son Arthur gathered the quarry before he could work into his hole, and soon after had a chance to try his own skill on another rodent, which happened to be in the same position. He did not make as good a shot as his father, but he performed a more noteworthy exploit, for, instead of hitting the animal, the ball struck a stone which was driven against its head and killed it. The deflected ball went into the woods at an oblique angle, and came near striking Warren Dunham, the road overseer, who was chopping half a mile away.

P. S.—There would have been a good many partridges to shoot here next October 1 if a certain immune had not shot a big part of them during the last week in August.

CHARLES HALLOCK.

Law Breaking on Vancouver Island.

THAT our cousins across the line in Canada have troubles of their own in the matter of game protection, is shown by the following note from Nanaimo V. I., B. C.: "Bitter complaint is made by local sportsmen and farmers in this district of ravages made on game out of season. Deer and grouse are alike destroyed by hoodlums from here, the trouble being especially bad in Englishmen's River district. Unless extreme measures are taken at once there will be a great reduction of game in this district."

The Adirondack Elk.

UTICA, N. Y., September 8.—*Editor Forest and Stream:* The movement which was inaugurated a few years ago for the propagation of large game in New York State received a serious setback this week by the killing of three elk near First Lake, North Branch of Moose River, in the Adirondacks. These animals belonged to the herd of five elk which were liberated in the wilderness during the past year by the Brown's Tract Guides' Association, with the hope of permanently establishing this splendid kind of game in that region. One of the quintet was accidentally killed near Clearwater on the Mohawk and Malone Railroad, and on Monday of this week the big bull and two cows were found dead in the woods in the vicinity of First Lake, where they had been shot down by some unknown parties. The elk, when liberated in the Adirondacks, took kindly to the change of environment, and thrived from the outset. They had become so tame that they manifested little, if any, fear of man, and were frequently seen at different points in the Fulton Chain region and the North Branch country. Only last Sunday the herd made its appearance near Old Forge, and was seen by upward of one hundred people. It is a matter of profound regret that these noble animals should have met such an untimely fate, and much indignation has been aroused by the apparently wanton slaughter of the trio.

W. E. WOLCOTT.

A PLATTSBURG, N. Y., dispatch to the New York Times, under date of September 9, says: "Two carloads of elk from Wyoming, constituting a herd of forty-three animals, were delivered at Paul Smith's to-day, and will be turned loose in the immense forest preserve of 40,000 acres owned by Paul Smith at St. Regis Lake. The elk are a present to Paul Smith from a friend in California. They arrived in good condition, and will be liberated tomorrow."

"William C. Whitney, of New York, has notified Dr. F. E. Kendall, of Saranac Lake, that he is about to ship to him a carload of elk, to be distributed about the Adirondacks wherever he finds places for them. Dr. Kendall has been active in agitating the question of restocking the forest with big game. He has decided to release some of the elk on the State road, just above the new State bridge near Saranac Lake."

"The number of deer reported killed in the Adirondacks during the first week of the open season is far greater than was ever before killed at this time of the year. Some attribute the increase in their number to the destruction of their usual feeding places by forest fires early in the season. Hardly an oat field or a meadow in the woods does not serve as a feeding place for deer."

Catgut, Cats and Sport.

HIGHWOOD, Conn., Sept. 11.—*Editor Forest and Stream:* Hearst's yellow dispenser of manufactured facts editorially imparted some startling information on September 4. It runs like this: "You hear a cat mournfully howling on the fence, the least musical of all created things. Part of the interior of that cat is necessary that the great violinist may produce his beautiful music." Now, as catgut used on violins is prepared from the intestines of sheep, it would seem that Hearst's natural history classes must be led somewhere astray by the above teaching. Instructively the writer of that editorial ranks "about as the backyard cat ranks musically."

As the editorial was intended to expound a moral principle, it seems somewhat out of place, anyhow, in the columns of a sheet which apparently values the intelligence of its readers just high enough to palm off a picture of a yacht as Shamrock which has two sets of spreaders, and looks suspiciously like Constitution.

In the same issue with the "backyard cat," fully one-third of the front page is given over to the important and intellectual announcement that "Jeff Will Fight Munroe." Some of the type is nearly four inches long, and ought to tempt the appetite of a goat at 500 yards. The heading extends entirely across the page. Such a delightful mixture of ink, misinformation—and sluggers!

And this sheet, which devotes its most important columns to the doings of bruisers, has the effrontery to prate of the inhumanity and brutality of hunting and fishing! Sluggers, good morals, humanity, hunting, fishing—inhumanity. Devery in the pulpit! What yellow insincerity! It is nauseating.

Camping on the Manistee.—I

Preparation.

PREPARATION is one of the many delightful states of existence known particularly well to the angler, the hunter, and the bridegroom.

In preparing for these events our actions are comfortably seasoned with acute anticipation, which is the gravy of reality. It is the smell of the cooking to the hungry, the grooming of conscience before confession, the unfurling to the breeze of life our standard, hope; we are "the whole show" of the darky and the watermelon; the spending of money comes easy because we need the goods.

It was only three months ago that Mr. C. L. Lockwood, of Grand Rapids, Mich., wrote me that his health would necessitate my joining him on a camping and fishing trip on the Manistee River in August. This letter was followed by a second one, saying that if I could see the beauties that Mr. Widdicomb, who had just returned from the Manistee, had sent to his house I would get sick, too. That did settle it. From that time until I saw the northern lights relieve the gloom of a departed day in

northern Michigan I had an unconquerable "failing" in that direction. For three months I had the pleasure of preparation.

Different waters needed different supplies; flies, waders, creels, nets, etc., and all must be just right. Letters were exchanged all the time, seasoning the gravy that has flavored a reality which memory shall retain, a palate taste, and friends made that shall last until the evening glow of life has gone out—men who have contributed their share toward the world's betterment by having lived in it.

The Start.

I find that the actual starting on a camping trip is like moving up to the fire, the warmth increases, the glow intensifies, while the gravy of reality reaches that state of epicurean detail that it only needs to be served, and the over-burdened soul of man is released from its fetters. The knife and the watermelon have met.

I reached Grand Rapids at 5 o'clock Saturday evening. At 11:15 the same night Mr. Lockwood and I left for Kalkaska. Of course we went to bed immediately, but not to sleep. Why sink into even temporary oblivion an anticipation whetted by time to a keenness of perfection? In the glow of the fire contentment is best felt in the waking hours. Then, too, our train should reach our destination at 3:45 in the morning. Surely an unearthly business hour; but we were going fishing. We didn't need

GOING IN.

sleep, refreshing sleep. From my berth I heard Mr. Lockwood lecturing the porter on the subject of wakefulness in all things in life, and particularly on those events so closely centered about Kalkaska at 3:45 the next morning, closing with the remark, "Porter, if you carry us past Kalkaska, somebody's mother will be without a son when I do get up."

That porter's love for his mother should be commended; he called us at a very safe distance from the danger line. But none too soon for us. We were not going to Kalkaska to live.

As we descended from that train our orientation was assured by silvery cast in the horizon, a glowing, though silent, yet majestic proclamation—another day is born. While the greater part of the world slumbers nature performs many of its most fascinating changes. The sunrise is the beginning of the play; the sunset is after.

Near the station we found a comfortable hotel, the good landlord of which had been notified of our coming by Mr. Harry Widdicomb, and the door was open. Mr. Widdicomb had gone on ahead the day before to have all things in readiness for an early start shortly after our arrival. At five o'clock the tried pioneer put in an appearance, welcomed us, and told us that everything was ready, while from the kitchen there drifted to our senses on that morning atmosphere the wholesome, welcome aroma of boiling coffee.

Mr. Harry Widdicomb.

It would not take a tailor long to measure Mr. Widdicomb with a tape line for a suit of clothes, nor cause him much anxiety as to the fit. How different a task, however, do we find it to measure a man in cold type. 'Tis the standard of manhood, not the human anatomy, that we must fit—the things left undone, the thoughts unsaid—that we must applaud with a greater zeal than the things done and said by him, when dealing with our field companions. In this case should I use my heart as scissors it would take too much cloth. To cut with my judgment would illy fit him—the pattern would be too small. A camera picture always produces the exterior view only; that won't do in this case. I can best describe Mr. Widdicomb as the Nestor of the Forest, the Sage of the Stream, and still hold in reserve very many pleasant thoughts of him all deserved, but, unsaid.

The Outfit.

In reviewing the outfit which left Kalkaska that pretty morning in August that was destined to carry us to scenes not to be forgotten, I am most impressed with its completeness in detail. The two teams were in charge of Marion Furgeson, whose knowledge of horses and the country traversed brought comfort to man and beast alike. Frank Taylor, of Mayfield, was in charge of the commissary department; his experience in the woods was insurance against a broken egg, and a guarantee of plenty. Harry Sherwood (deputy game warden), boatman, auxiliary cook, was always in evidence, always useful, always willing; of Sherwood I can best applaud myself for the things left unsaid. The detail of accessories for this encampment was only made possible through necessities, many needs gathered together by long experience, dictated by careful thought of Mr. Widdicomb.

It was only after reaching camp that I discovered that the box of the wagon that carried the outfit was a boat, built to fit the hounds of the wagon. In this boat were packed all the necessities for our life in the woods, besides many luxuries. At 6:30 this formidable calcade moved forward, its outrider being Duke, Mr. Widdicomb's blue-bellon setter dog.

For many miles we traveled through a prettily settled farming district, so rich in the produce of plenty that happiness only seemed the lot of all, both wanderers and those at home. It was not by the side of a turnip patch nor in the shade of a peach tree, however, that our

pathfinder proposed pitching our camp. The luscious plums hanging beside the picket fence looked inviting; so did the red apples nestling in clusters amid their green abode; but we were after different fruit. It was the wilderness beyond the reach of the plowshare that held for us the things that had cost us many hours of sleep, things not found in the market places, out beyond a land whose only value is the yearly crop of wild blackberries—a land devastated of its worth, its beauty, its splendor, a land stripped and left to its own decay, and made more ugly by the blackened stumps of the monarch pines that once had "netted the sunbeams" that warmed their growth—a once beautiful forest seemingly stricken of heaven. It was to a point through this, and still beyond, that our standard of hope was unfurled and waiting.

From the farms we entered the barrens; from the barrens on into the woods, where the hat brims were turned up, and the horses shook themselves in their harness to cool their parts that were bound. They were watered from a brook where Duke lay, showing only his head, while we men leaped from the confines of a spacious carriage to stretch our legs in the shaded road. Here gigantic birch and hemlock trees meet like a flock of sheep when the sound of the wolves is in the distance, as though in self-protection. The ax and the saw had not entered there, a lesser market value had spared those trees. Beyond, however, we come again to the skeleton, and the horses stop of their own accord, as if loath, indeed, to leave so lovely a spot. Even Duke took refuge in the carriage. Out there a chipmunk even would be disgusted with life. The teamsters dropped to the road and walked. The dray horses' heads were released from their reins, and their necks grew longer, as if to meet the miles to come.

At 12 o'clock Duke grew restless, drew in his long purple tongue and sniffed the air, then left the carriage. Our horses seemed to quicken their pace, and the teamsters remounted their seats. At last the Manistee River was in sight. Around a bend in the road we saw that splendid torrent of hope winding past the alders with the quiet grace of a vast serpent.

Our dullness fell to dust as the wheels passed over the unhewn timber bridge and came to a stop on a grass plot watered by a nearby spring. Here everybody and everything took a drink; and with the hearty assurance of Mr. Widdicomb that "It's only two miles more," we pushed on.

The Camp.

Where the river loops but does not meet, with a river's margin on three sides of us, on a spot once famous as the site of a lumber camp, where Jackie played seven-up by the camp lantern, we pitched our tents on a site from which radiated the minds that directed and the muscles that swept the land of its natural beauty—yet happily now so long ago that nature has spread over the ruin a green mantle of scrub, hiding the black tombstones of an ancient glory, and giving a youthful and hopeful appearance to the rolling landscape. Here, ten miles from human habitation, we selected our temporary abode.

The completeness in detail noticed early in our journey was here made manifest, flavored by the gentle and thoughtful touch of her who rules. One tent 16 by 10 sprang into shape as our sleeping quarters; another one, 12 by 10, soon basked in the sunshine for the camp men; still another, of the fly variety, fell into shape for culinary purposes. One mind and many hands made short work of an intricate job.

The horses, released from their harness, rolled and reveled in bunch grass. Duke warned the nearby trout of our arrival, and dried himself on the fond master's blankets.

In one hour we were housekeeping. Beds were pumped up and put in hospital order. White blankets with pretty pink borders, gray blankets with blue borders, red blankets with black borders, were brought to view with a lavishness that could only have been directed by those at home. Even sheets and pillows hove into sight as the mysterious packages were unfolded. The sheets were not

WHERE THE RIVER LOOPS.

used; we were camping. A closer view revealed a compact medicine chest with remedies for all legitimate ills and some accidents.

In reviewing the time and the place, when and where this camp was made, I am apt to remember in a vague sort of a way that the time was Sunday, the place the wilderness, and pass on. A supplementary thought that almost loses itself in the race with other thoughts, balances itself in bold relief long enough, however, to determine that we ought to have had trout for supper. As the darky dances in the moonbeams beside the worm-fence, and the fallen dew makes silver ornaments of the watermelon leaves, and the crickets make merry, drowning the noise of his bare feet amid the dewberry vines, does conscience check his smile?

As the sun passed beyond the western hills, giving place to the stars, the care of night, a few of my New Jersey neighbors, "pinged" their usual songs; but for a short time only. The falling dew dampened their ardor and gauzy wings at the same time. A whippoorwill called his nine hundred and ninety-seventh note without taking breath. The crickets chirped in great glee. Logs from the ruins of the Jackies' homes were piled high and lighted, making a camp-fire that from a distance looked like a premature sunrise, while we sat around dishing out the gravy of a ripe reality; breathing, feeling, seeing and

knowing the fullness of preparation and anticipation. The darky, the knife and the watermelon were together.

On the Manistee.

The gentle sound of running water as it swirls past the end of an old water-soaked log, away from the confusion of the habitation of man, gentle though it is, indescribable indeed by any namable sound, in a stillness so intense that the discordant call of a wandering 'coon is musical, would cure insomnia in the early night and produce the electric awakening of a vivid alarm clock in the early morning hours. Such are the effects on the human mind where the river loops but does not meet on the Manistee. We needed no calling on Monday morning; nor did Mr. Taylor serve breakfast too early for the animated anglers. Our Sunday inspection had led us to believe that we should catch some trout on this the second day of the week, and we did.

Breakfast over, Mr. Widdicomb introduced us to our wading attachments for the preservation of our fish. My heart was quite broken when I found my new creel could not be used. It consisted of a floating creel or live box attached to the belt with a rope three feet long. I think it was Mr. Lockwood who made the remark that "It seemed a wise purpose, but a deucedly awkward one." I for myself knew that I would get mixed up in the harness within an hour, and I did. My legs were over the traces more than once; but at the end of a week I was "broken,"

THE MANISTEE.

and not a single trout was killed until we left camp.

At the end of the day the team always met us on the margin of the river; the boat was placed on the wagon, the well in the center was filled with water, and our trout were transferred to the well. On arrival in camp they were then placed in the permanent live box in the river and kept there until we should need them.

Sensations.

In referring to sensations, I would that I could corner the market in print as I did in feelings. But I am not so old, nor yet so foolish, as not to know that others in the years sadly agone, and still in the active and thrilling period of youth to come and middle age, elsewhere have felt, and still feel, and will continue to know the sensations that come and are still felt by the angler when the water is gurgling around his thighs as he stands alone in the middle of a beautiful, active, musical river; on each side of him in thick array a variety of foliage and wild flowers, dipping as if drinking from the current under whose surface lie the speckled trout. The stillness is majestic. Expectancy increases the heart beats. By an opening in the alders hangs a red flower; on the grassy bank, just this side of it, is seen an old log mostly hidden; just one end of it rests on a stump. You make your short cast and draw the line from the reel; draw back and cast again, always in line with the red flower. Another backward movement with the graceful rod that takes up your forty feet of line and carries it up and back in graceful curves. Again the guides are fed and the rod springs forward. The red flower seems near; by it the fly strikes the water, turns over on its side, as if the flight had tired it; yet it moves across the current and hesitates. From beneath the log the greedy eyes of a big trout see the exhausted fly, and on murder bent he darts with the quickness of a flash, rises powerfully in the air, and with head down pounces on his prey. Quicker still do the muscles of the arm tighten and gather and strike. The suddenness with which that trout is straightened sends the water three feet high on either side of him, and the contest begins. A "rough house" is created. He mixes the fight with muscular endurance and determination; churns the pool into foam; tiring of this, he breaks for cover, is held in check and sulks. Your heart beats disturb him again, and he rushes, but is rounded up at the end of each go. Your nerves disturb him again, and he mixes once more—runs, backs and fills, until your line is gathered in, the rod passed over your shoulder, and the landing net confronts him. He mistakes it for the gateway to paradise and loses. You have conquered, and enjoyed sensations that the selfish would grieve at dividing, the generous give to all. The watermelon has been cut.

T. E. BATTEN.

[TO BE CONTINUED.]

Whales on the Florida Coast.

THREE whales were stranded the other day on the South Beach at St. Augustine. The correspondent of the Jacksonville Times-Union writes:

"The three whales lying stranded on South Beach have had their measures taken. The largest is thirty-seven and one-half feet long, the next is thirty-six, and the third a little more than thirty-four feet from nose to tail. They range from seven to seven and one-half feet through, and weigh, perhaps, not less than three tons each."

"It was not a difficult task to secure them last night when the tide had receded. The three monsters were entirely out of water, but still alive. Mr. Atwater, the discoverer, Frank Reddington, Harry Robertson, and half a dozen others took part in anchoring them. It was impossible to kill them with a rifle or pistol ball, or to make any impression on their hides with shot. Ball and shot simply made a slight abrasion of the outer cuticle."

"When the tide was lowest, Mr. Atwater succeeded in passing stout ropes around their tails. In this work he

was aided by a bright moon. The ropes were then secured to the beach with stakes and the flopping of the huge tails was all that remained to prove that the whales still lived. Watch was kept all through the night, but when the tide came in they were too far gone to escape. One lived until about 9 o'clock this morning, notwithstanding the fact that huge holes had been cut in their carcasses just below the head with sharp axes.

"The arrival of such prominent tourists from the north, they having probably passed all the beach resorts on their way down, speaks well for Anastasia Island as an attraction. But were the truth known, it would be that the whales, evidently mating, had ventured too near the shore, and had been thrown into shallow water by the fury of the storm that prevailed during the time. It was observed that there were many other whales a short distance from the shore before the three captured ones were seen struggling in the breakers.

"Awake to the opportunity, the management of the South Beach Railway Company issued dodgers early this morning, and ran trains every hour for the convenience of citizens desiring to visit the beach. They went by train, in carriages and on wheels. Even the only automobile at present in service here made the run with a party to view the unusual sight.

"No one here seems to know how much sperm oil whales of the size of those captured will produce, but the find must be worth many hundreds of dollars, as the oil is worth upward of one dollar a gallon. Under the direction of Mr. Reddington, a gang of men is now at work securing the blubber and cutting up the flesh to be rendered into oil. The whales are imbedded in the sand so that no more than one-half of their bodies is exposed to view. This half has been stripped of the outer cuticle, which peels off easily. It is black and glossy, and looks exactly like a camera film.

"The whales are shiny black, with heads more than one-third the length of their bodies. Their eyes are back of their heads, the apertures being very small. They have thick fins on either side of the body, and tails similar to those seen in pictures. They lie stranded not fifteen feet apart. Two lie with their heads to the shore, and the other with its head toward the sea. He evidently managed to turn, and would have escaped if the rope had not been there to detain him. They have square snouts and small mouths, with teeth something like an alligator's. The jaws will be preserved for exhibition.

"Cottagers on the beach are anxious that the monsters be reduced to oil as speedily as possible. The blubber does not decompose rapidly, but it is feared that the flesh will send forth anything but a pleasant odor if not quickly disposed of. The 'rendering' will be done in sugar kettles, and the oil will be stored in lard barrels.

"It will require several days to dispose of the carcasses, and meanwhile hundreds of people will be attracted to the beach to view the sight."

Camps on State Lands.

UTICA, N. Y., September 6.—*Editor Forest and Stream:* There appears to be quite a difference of opinion as to the wisdom of the policy which the New York State authorities have inaugurated in regard to the parties who have erected camps on State lands. It is not many years ago since Adirondack lands were frequently sold for unpaid taxes, and in those days men could locate their camps almost anywhere they pleased in the wilderness region without danger of protest or molestation from the owners of the property. They hunted in any portion of the woods and fished in any of the waters, and there was no desire or attempt on the part of anyone to prevent their doing so. Some of those whose homes are now on State lands have spent nearly all their life time there, and others have resided for a score or more of years where they do at present. Possibly when they located and built on the land it did not belong to the State, and the settlers had no thought that it would ever become the property of the Commonwealth; but however that may have been, the probabilities are that they felt they were injuring no one by their action, and anticipated no attempt to dispossess them. Many of the men who have dwelt for a long time in the woods and retained peaceable and undisturbed possession of their homes have come to feel that they have some rights there which others, as a matter of justice, ought to respect. They love their wilderness homes, and would naturally be deeply hurt if compelled to give them up. Notices have been sent by the Forest, Fish and Game Commission to quite a number of campers on State lands in the Adirondacks, making them defendants for illegally withholding the land from the use of the State, and naming the sum of damages as \$1,000, and these notices served to throw the occupants of the camps into a panic. Indignation is said to run high in one part of the woods at the action of the Commission, and it is freely hinted in that section that if the campers are compelled to vacate their summer homes the fires of this season will not be a circumstance to what the Commission may expect next year.

It is possible that from a legal point of view some of the woods dwellers are trespassers on State lands; but admitting it to be true that the titles to the sites upon which their homes stand are vested in the Commonwealth, what can the State hope to gain by peremptorily ejecting them? It might be quite difficult in most cases to show that they are doing any actual harm to the property or that the land is lessened in value because of their occupancy. On the contrary, there are understood to be instances where the actual cash value of the site has been materially enhanced because of the improvements which have been made by the settlers, and instances, too, where these men have rendered good service to the State in preventing or suppressing forest fires, or aiding in efforts to insure the observance of the game laws. What harm can it do to allow them to retain their homes for life or for a term of years at least, subject to certain conditions or regulations? While the presumption is that the State has the authority to eject parties who are occupying camps or cottages on its lands, there is no law, so far as can be learned, which renders it mandatory upon such parties to vacate unless explicitly ordered to do so; or, in other words, nothing in the statute books which makes it illegal for them to occupy their present homes providing the State does not object to it. It is also understood that the State is at perfect liberty to allow them to remain

if it is disposed to do so. Section 7 of the new constitution of the State adopted in the fall of 1894, says: "The lands of the State now owned or hereafter acquired constituting the forest preserve as now fixed by law, shall be forever kept as wild forest lands. They shall not be leased, sold or exchanged, or be taken by any corporation, public or private, nor shall the timber thereon be sold, removed or destroyed."

For some time the policy was adopted of permitting those who had buildings on State lands at the time the new constitution was adopted to retain them, although emphasis was laid on the fact that no additional structures of a permanent nature would be allowed. More recently, however, the authorities seem inclined to get rid of all settlers, and that they have the authority to do it appears evident, for section 222 of the forest, fish and game law provides that: "Actions may, on the order of a commissioner, or of the chief game protector, be maintained in the name of the people, through special counsel, whose compensation shall be fixed by the commission, to recover damages for trespass or waste on lands in the forest preserve, or to prevent trespass or injury thereto with relief by temporary or final injunction; or to recover possession of lands belonging to the State within the forest preserve," etc.

Beyond a doubt many of those who now reside on State lands in the Adirondacks would feel that it was a very great hardship to be compelled to give up their homes, and possibly some might think they had a just cause for grievance. Reference has been made to the hint thrown out to the effect that if campers are compelled to vacate their summer homes that the fires this season will not be a circumstance to what may be expected next year. Of course it may be argued that such expressions as this ought not to influence the action of the State or to be given a moment's consideration, but it is well to look at every matter of business from a business point of view. The State is confronted by a condition rather than a theory in this connection. It is fair to assume that if the State insists upon ousting all occupants of its territory that it hopes to gain something thereby, for otherwise why should it undertake a movement which necessarily involves a great deal of labor and expense and will occasion serious inconvenience to many of its citizens?

Everyone who is at all familiar with the Adirondacks knows that a few determined men could cause the State an endless amount of trouble if they started out to do so; for by setting forest fires in a dry season they could bring about a general conflagration there which no force that it would be possible for the State to muster could hope to control or check. It is true that if a calamity of such a nature should occur a few of the offenders might be captured and punished, but that would not in any degree compensate the State for the loss incurred. It must be borne in mind that when the primitive forest of the Adirondacks has been destroyed by fire, this means the destruction of the soil as well, hence hundreds of years must elapse before the original growth of trees can be duplicated. To put the matter in a nutshell, it would not be a difficult feat for a few incendiaries to cause a thousand fold more damage to the forests than the monetary value of all the camp sites on State lands, and it could be done in two or three days. Furthermore, there are many other ways in which the State's interest could easily be injured by parties who undertook to do it, and this is notably true of the fish and game, which, if certain illegitimate methods were resorted to, might soon be practically exterminated. It would be a source of gratification to law-abiding citizens if there were no such possibilities as have been suggested, but they apparently exist, and the question as to whether it is wise to ignore them seems a very pertinent one. The State has recently had a very expensive object lesson in regard to forest fires, and it is one which should be profited by. The Adirondack wilderness covers a vast area, and in order to thoroughly protect it from fire and guard its fish and game, should enemies of the State attempt to work havoc in that region, would require regiments of trained and trustworthy men. It is always better to avoid trouble than to court it unnecessarily. Viewing the situation in a practical light, therefore, it would seem to be the part of wisdom not to act too hastily in regard to the ejection of settlers on State lands. Possibly some arrangement might be made with many of them by which they would agree to aid the State so far as possible in preventing forest fires and protecting fish and game in consideration of being allowed to retain their present homes. They would certainly make very efficient helpers, if they could be sufficiently interested to act, and it seems advisable to give the matter careful consideration before any decisive steps are taken which are likely to antagonize the woodsmen.

UTICA, N. Y.

W. E. WOLCOTT.

Vermont Fish and Game League.

THE annual meeting of the Vermont Fish and Game League was held at Fort Frederick on September 4. Among those in attendance were Congressman Sibley, Justice D. J. Brewer, of the Supreme Court of the United States, Senator Redfield Proctor, Congressman D. J. Foster.

President F. L. Fish, in his address, spoke of some features of Vermont's present fish and game laws. He said that in the lower part of Lake Champlain each spring there were taken thousands of barrels of wall-eyed pike when they were on their spawning beds, and when they were then valuable to the fish interests of the great lake. New York has already passed a law forbidding the spring seining, and Vermont had a statute co-operating with the laws of Canada. He asked the assistance of the league in securing the passage of a law in Canada forbidding all seining in Lake Champlain. He also called attention to the law passed by the last Legislature allowing an open season for black bass in Lake Champlain the year around. Certain fishermen have gone on the spawning beds of this valuable fish and committed great depredations as a result of this law, and he asked that an effort be made to repeal it. Another need was more wardens, especially to protect the deer in this State. During the past closed season seven deer in this immediate vicinity had been shot and their hides hung up in the woods to dry. Some of the league's money was being used for wardens, but more are needed.

Pointer Club of America.

Editor Forest and Stream:

Enthusiastic reports are now frequently received from reliable sources relative to the abundance of quail which are frequently seen on lands adjacent to the Holmdel estate, on which the fourth annual field trials of the club will be held. The property exceeds 4,000 acres in extent, and has always been preserved. The Field Trial Committee may therefore be congratulated on having the concession granted the club for the holding of our trials. The trials will commence on Monday, November 16, and in addition to the stakes and added money, a valuable silver trophy will go to the winner of first money in each stake.

The Derby, All-Age and Championship Stakes will close on October 15, the entry money, \$5, with each nomination; balance, \$5, \$10, and \$20, respectively, on the morning before starting. Members' stake will close before starting. The championship stake has \$50 added, to be divided between first and second dogs, and is the only event on the card which is open to the world, and will also close on October 15. The placed dogs in all stakes will receive 50, 30, and 20 per cent. of the stake.

Holmdel, N. J., is situated three miles from Hazlet Station on the New Jersey Central Railroad, 35 miles from New York, via Liberty street ferry. Excursion rate, \$1.35.

The headquarters of the club will be at Union Hotel, Holmdel, conducted by E. W. Perrine, who will furnish good accommodation at \$2 per day. Ample provision has been made for the care of dogs.

C. F. LEWIS, Secretary.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

SEPTEMBER.

19. Chicago, special, Lake Michigan.
19. Seawanhaka Corinthian, club, Oyster Bay.
19. Larchmont, schooner cup race, Larchmont.
19. Atlantic, fall regatta, Sea Gate.
19. Bensonhurst, Y. R. A. of Gravesend Bay.
19. Manhasset Bay, Y. R. A. of L. I. Sound, fall regatta.
26. Riverside, Y. R. A. of L. I. Sound, fall regatta.
26. Seawanhaka Corinthian, club, Oyster Bay.
26. Chicago, handicap, Lake Michigan.
27. Williamsburg, open, fall regatta.

OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.
3. Columbia, special, Lake Michigan.
5. Southern, fall, New Orleans.
10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the

boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

The Cruise of a Catboat.

BY C. E. NOXON.

To a person inexperienced in the art of sailing, and ignorant of the caprices of wind and wave, there is a vast deal of schooling to be gained by a week or two of small boat cruising, and moreover when such a cruise is taken in a season like that of last year—a year in which there were but two months of summer, March and November—it is more than probable that the novice will have an experience at once lasting and impressionable.

At first we were not agreed as to the best way to spend our vacation. Carl was in for a hunting and fishing trip; I rather inclined to the idea of canoeing around the peaceful solitudes of the Kawartha lakes in Canada, while Beck stolidly held out for yachting. He could get a boat, he said, and a first-rate skipper, and all we would have to do would be to lie around on deck and smoke, read and sleep. And then he launched out into a rapturous burst of eloquence over the prospects and possibilities of a cruise. He spoke of the delightful sensation

HUGHEY'S TABLE D'BOAT.

of skimming lightly over the waves, with the exhilarating breezes fanning our ruddy cheeks; the ever-changing vistas passing like a panorama; putting in here and there at quaint and lovely little harbors, making new friends and talking nautical "shop," and perchance a lively and exciting brush with some ever-eager opponent. And then the charm, the grandeur of the nights; with the boat dancing merrily on the deep, the musical lapping of the water at the bow, the cool evening zephyrs lulling us into an ecstasy of repose, and the great yellow moon and myriads of sparkling constellations shining like a benediction on the scene.

That was Beck's idea of yachting. He is wiser now. He knows that when it comes to cruising there is a whole lot more fun in anticipation than in realization; and he knows also that on an innocent-looking catboat, with only one sheet and a couple of halliards—simplicity itself—there is more work and hustle than the average land-lubber wots of. It has furthermore been borne in on him that a yacht prancing around at her anchorage in the harbor is not the same docile craft, once out where she can cut loose and have her own sweet way. Carl and I know all this now as well as Beck. But we didn't before, and so, in a moment of weakness, we yielded to the alluring temptations of a yachting cruise, and put in two strenuous weeks of battling with wind and weather and the unfathomable mysteries of a catboat.

And yet we cherish no very great animosity toward yachting. We had a lively lesson in the school of experience, and now, in the afterglow of retrospection, memory loves to wander back over the scenes of disorder and delight; to plunge madly about in stress of storm and glide gently by on the placid depths; to hear again the thunder's roll and gaze with anxious eyes upon the lightning's angry flash.

It was a beautiful morning in August when Hughey, the cook, finished stowing away the last box of provisions, Skipper Charlie Eastwood yelled "All aboard," and the big 30-foot catboat, Kittie, of the Rochester Yacht Club, filled away for Sodus Bay. It is unnecessary to dwell on the harrowing events of the first day out. It seemed as though the elements had been in hiding somewhere outside the Charlotte light waiting to get a good whack at us, for we had hardly squared away when the wind increased, the sky became overcast and old Ontario looked like two parallel walls of water. It has been said by some irresponsible person that waves never attain a height of more than fifty feet, but I can summon witnesses to prove that the horizon was directly over our heads all the way to Sodus. The dinghy, which we were towing, after several unsuccessful attempts to board us, finally parted company with us, and subsequent events proved that that dinghy was a wise little boat. How we

ever made Sodus will forever remain a mystery, at least so far as I am concerned, for I was a cabin passenger during the last half of the trip, nursing a well developed grievance against yachts in general and catboats in particular. That night, however, after eating one of Hughey's table d'boat dinners and puffing peacefully at what Ouida calls a "pocket philosopher," I began to take a more cheerful view of the situation, and being assured by the wise old skipper that such weather couldn't last, I decided to continue on to the next port. But the weather did last, and all the next day a furious gale swept down the lake, lashing the water into tremendous seas. Toward evening, however, it showed signs of dying out, and the following morning we drifted slowly out into the lake almost in a dead calm. We fell in with the Kee Lox, also of the Rochester Yacht Club, and challenged them to a drifting match. They were going around the

SACKETT'S HARBOR.

same course that we had marked out, and megaphoned us that they would stay with us all the way. But after we had put a mile of nice open water between the Kittie and their spick-and-span sloop yacht, they evidently changed their minds about "staying with us," for we saw them putting into North Fair Haven along in the afternoon, while we continued on. It was a slow day and nobody was sorry when, just as the sun was dipping behind the western horizon, we sailed into Oswego harbor under the white ash breeze of Charlie's sweep. Here we met a horde of yachtsmen whose apparent sole ambition in life is to see that visiting yachtsmen are royally entertained. It is not within the province of this article to state what they did to us, but when the reader understands that on the nights of the two succeeding days, after making unsuccessful attempts to flee the city, we crawled back under the cover of darkness and moored our boat in the Stygian shadows of lumber piles, he will realize that we had no particular yearning for continuous performances of Oswegonian hospitality. If the god Bacchus were ever to come and make his habitation among the children of men, he would find his natural element among Oswego yachtsmen.

It was not until Saturday morning that we finally got away from the Starch City, and with fresh westerly wind almost astern, we shaped our course for a long run across Mexico Bay, one of the most treacherous spots on the lake. This bay is marked by a long cove, the southeastern end of Lake Ontario, and with a brisk wind driving down the lake, combined with a suction-like draft from off-shore, we were compelled time and again to tack out into the open to save ourselves from being drawn into the breakers. Many rotting hulks line the shore, eloquent testimony of the treachery of this bay, and, as we learned afterwards, sailors avoid it as they would a plague. It was about five o'clock in the afternoon when

PRINYER'S COVE, BAY OF QUINTE.

we cleared the bay and were standing off Stony Point Light in a dead calm. Sackett's Harbor, our objective point, lay about ten miles further down the lake. The prospects for a dreary night's sail were excellent. There was not enough air stirring to give us steerage way. The tedium of the run across Mexico Bay had put everybody in anything but good humor, and the skipper particularly was a bundle of irascibility. Suddenly he jumped to his feet.

"Stand by!" he yelled, "and help me reef her. There's something ugly cookin' over there."

And following his outstretched hand we saw there was "something," indeed. Over back of Galloup Island great black, ominous looking clouds were looming up and coming our way at a great rate. As I couldn't tie a reef knot any more than I could fly, I was ordered to take the tiller and "hold her off the wind." This was the other horn of my dilemma, but I courageously grabbed it and waited for the oncoming hurricane. I must have shoved the fool tiller the wrong way, for when that storm hit us the Kittie spun around like a top, and before I had a chance to mend matters, Charlie was on me like a flash, and like another flash I was in the cabin with Hughey. That storm must have been born somewhere up in the Baffin Bay region, for there were hail, snow, rain, wind,

and several other elements mixed up in it, and the way that catboat ironed down the waves was a caution. About half-way to Sackett's the storm abandoned us, leaving as a memento of the occasion a temperature of about 25 degrees. Of course Beck and Carl were out in all of it. An armless wonder can navigate a catboat—anybody knows that—but they had become possessed of the idea that it required everybody on board to sail the Kittie, and as a consequence they would fuss around on deck and become all tangled up with the halliards, and swear, and get sworn at, and get wet, and dislocate a joint or two, and then, after it was all over, jump on me because I wasn't outside helping to make a confusion worse confounded. So that night while they heaped maledictions on my head, I quietly curled up in a blanket and went to sleep.

Sackett's Harbor is a quiet little town admirably located on an eastern arm of the lake and possesses one of the most charming coves imaginable. It was here that the American and British clashed in a sea fight in 1812, and the old town still carries the scars of that battle, the big town hall, built of stone, being perforated in a dozen places. It is here also that the Madison Barracks are situated, in which is stationed the "Fighting Ninth," the regiment that covered itself with glory in China and the Philippines. Soldiers literally throng the streets, their long, swinging gait demonstrating the regimen of army training, their ruddy complexions testifying to arduous service under tropical skies.

We spent Sunday here, and on the following morning, with a fair wind abeam, we headed for Cape Vincent, intending to spend the night in the gateway of the Thousand Islands. But we had hardly gone three miles when another exasperating calm settled down and left us to fiddle around in the doldrums the rest of the day. We whistled for wind, prayed for it, and then fell to cursing it, but it cameth not, and along toward sundown the trusty sweep was called into play, and we crept slowly back to Sackett's Harbor. The next morning ushered in a cold, drizzling rain that put a damper on everybody's spirits, but we ordered Skipper Charlie to make ready and get somewhere if we froze to death in the attempt. We had just swung clear of the dock and were spreading sail when Hughey, the bright boy, made the interesting

KITTIE IN PRINYER'S COVE.

discovery that there was no bread on board. This bit of intelligence put us all in a happy frame of mind; especially Charlie, to whom the task of making landing and getting under way was a matter of life and death. It is not necessary to repeat here the dialogue that ensued between him and Hughey over the bread question; suffice to say that the latter was ordered out after that important staple. He returned in about an hour, said there was a bread famine in the town, and that he had had to reach out into the country for it, backing up his statement by producing two loaves of such prodigious size (such as only a farmer's wife can bake) that they had to be cut in two to get them into the cabin.

Then we made another start, the sun came out, and, catching a lively breeze on our quarter, we were soon abreast of Peninsula Point, and with a slight shift of position and a started sheet the Kittie began to lay down to her work with a vengeance. The Cape Vincent light shimmering white in the glare of the noonday sun soon appeared away to the east, the Duck Islands loomed up on our port rail, while a smoky haze in the northeast told that we were rapidly picking up Kingston. In another hour or so we had Cape Vincent put down, the Ducks were mere specks on the water, and away to the north, almost directly off the horn, a shaft of white bespoke the Point Pleasant light at the entrance to the Bay of Quinte.

And then the wind died away.

It was evening before we got another breeze, and about ten o'clock we were standing off Prinyer's Cove in the Bay of Quinte, not knowing whether to put in there or anchor outside for the night. Charlie said we had better anchor, as he was afraid a sandbar might ground us. Accordingly he made haste to heave the anchor, and sent me below to loosen the anchor line. I uncoiled all I could find in the dark, and Charlie let her go. About sixteen feet must have gone over the side, but somehow it did not strike Charlie as being quite right.

"Is that all the blanked line there is?" he asked.

"Sure," I replied, coming on deck.

Then he consulted his chart. It showed twenty fathoms. Then he swore. Then he went below himself. Then he swore some more. Hughey, who was sleeping, awoke just in time to dodge frying-pans, blankets, pillows, dress suit cases and other miscellaneous articles which had been sweetly reposing on about three hundred feet of anchor line. In the meantime the boat, under Carl's skilful guidance, had been steadily drifting toward the cove, and when Charlie got through swearing we were inside and didn't need the anchor. We bumped up alongside a big excursion steamer in the darkness which was moored to an apology for a wharf, and, being tired out, we put a stern line over the steamer's deck railing and a bow line over her flag-pole and retired to peaceful dreams.

We had a rather rude awakening the next morning about five o'clock when that big steamer commenced thrashing around in her efforts to back out into the channel. After a succession of bumps which jarred us all out of our bunks, we heard two voices engaged in conversation. It was not exactly the drawing-room variety, but it was couched in comprehensive and unequivocal language which carried with it the conviction that it was dominated by some vigorous thought. As I poked my head out of the hatch I saw Charlie making heroic efforts to get his lines free from the steamer, while the mate of the big boat was as industriously bent on fouling us in every way he could, evidently thinking it was a fitting punishment for our audacity in snubbing up to them. Both men were carefully tracing out each other's genealogy, and the chances for serious trouble seemed good. Finally, however, by our combined efforts, we cast free from the steamer, and with a parting fusillade, this time from both crews, we warped into the berth just vacated and waited for breakfast.

It was a beautiful morning. The sun was just peeping out from behind the horizon, shimmering the landscape and water with light; there was the faintest rustle of a breeze, and we were anxious for an early start. Breakfast was soon over, sail spread, and in a few moments we were floating lazily out of the cove. Then for the first time the beauty and grandeur of the Bay of Quinte were spread out before us. The magnificently wooded Prince Edward Island, broken here and there by towering hills on the one side, and the low, undulating country of the Canadian mainland, dotted by picturesque and romantic farm houses on the other, completed a fascinating scene. As we reached further up stream, the hills became more rugged and frowning, the bay more winding, and every turn afforded a fresh surprise. The sun was now high in the heavens, what breeze there was held well on our quarter, and as we lounged lazily on deck, puffing our pipes and enraptured with the delightful scenery, we beamed on each other with smiles almost beatific in their expression.

As you near Deseronto the scenery becomes even more beautiful; charming summer cottages line either side of the bay; dozens of yachts and other small craft are flitting about and the whole picture is one of animation and gayety.

We tied up at Deseronto long enough to satisfy ourselves that it is the limit in the way of towns, and that one can't buy or beg milk there (as we were on vacation, we did not attempt to steal). I don't know what that town does for lacteal fluid. Between Sackett's Harbor and Deseronto a man with an appetite for bread and milk would starve to death.

Skipper Charlie predicted a fine night to sail to Belleville, twenty miles further up the bay, and we joyously entered into the proposition. In the light of what happened, I hardly think we can ever take Charlie's word for anything again. He meant well, but as a prognosticator he is a glittering and iridescent failure.

It was a glorious night. The pale moon hanging in the southern sky shed a soft refulgent light over land and water. There was a light air stirring as we swung into the main channel, and after proceeding a mile or two a delightful night breeze sprang up that caused the Kittie to jump forward at a rollicking speed. Blankets were spread out on deck, pipes were lit, and we settled back to ease and comfort. Lighthouse after lighthouse was picked up and left behind. Away off in the east could be heard at intervals the hoarse whistle of a steamer, and presently the fierce rays of a searchlight were dancing on the water astern. The wind freshened; the yacht heeled still further.

"That steamer won't catch us in a hurry," remarked Charlie, as he trimmed the sheet.

Then we fell to speculating on how long it would take to overhaul us, what steamer it was, and a hundred other things of equal importance. In fact, we had become so engrossed in what was going on astern of us that we had utterly forgotten to keep a watch ahead. Suddenly Charlie gave a little cry of surprise.

"What's up?" inquired Carl.

"Lightning," was the laconic reply.

Sure enough, away to the westward, vivid flashes could be seen, and in a few moments the distant rumbling of thunder was heard.

"I guess we are in for it," said Charlie, yanking out his oilskins. "These d—d thunderstorms always work to windward, and it's going to be nasty out here."

Already we were beginning to pick up the Belleville light, and we thought if we could only make that harbor before the storm broke life would be worth living after all. The big steamer Caspian finally passed us and we had the whole bay to ourselves. It was now twelve o'clock midnight. Charlie had begun to shorten sail, his valuable assistants rendering heroic service in the way of getting everything all mixed up and making night hideous with their vituperation. I put on a rubber coat and stationed myself before the mast prepared to desert the ship at the first sign of danger.

By this time it was blowing a gale; the sky was covered with clouds; the lightning played about us with rude familiarity, while the roar of thunder was deafening.

"Keep a sharp lookout for the light," yelled Charlie, "and tell me when you see the base."

"Aye, aye, sir," I yelled back, thinking of home.

And then the storm broke with all its fury. Out went the light, leaving us nothing but the compass to steer by. Every few seconds the Kittie would poke her nose into a towering wave and I would get barrels of water over me. I was yearning most fervently for an inside job, but to let go meant good-by, so, like Ulysses of old, I lashed myself to the spar and hung on for dear life. Charlie had dropped the peak half-way down the stick, while Beck and Carl, bundled to their eyes in great coats, stood by to take in the sheet should it come to blow too hard. Suddenly the light blazed out almost dead ahead, and in another minute the brilliantly lighted harbor of Belleville was opened up on the starboard side. In the twinkling of an eye Charlie put the Kittie about and we scooted into that haven of refuge like a scared cat.

It was a tired, wet, and disgruntled crew that sought the bunks that night, but the next morning, after a hearty breakfast and a constitutional turn about the pretty little city, we took a more philosophic view of our misadventure of the night before and felt rather eager to continue

on the last leg of our voyage to Brighton. We decided to give the skipper a holiday, however, in recognition of his valiant services, and on Friday morning we started out on the last day of the cruise. Of course at the entrance to the Murray Canal we encountered a headwind. There is never anything else there. A fellow told me that once a yacht actually did sail through this canal from the lower end, but it was so long ago that the story is more legendary than historical. There is only one means of propulsion on the Murray Canal from east to west and that is human. Don't wait for a slant. Get out with your line and pull. It will save time and temper. Besides, you will need that temper when you come into contact with the toll-office. It is said of the toll officer on this canal that he feels hurt if yachtsmen pass him without consigning him to the Plutonic realm. He

GLENORA, BAY OF QUINTE.

seems to think he has been slighted. If that is so, we left him in a state of blissful tranquillity.

It took us the greater part of the day to pull that big hulking catboat through the canal, and when at last we got to Brighton, we all struck. Charlie had a number of seafaring friends at this port with whom he wished to visit, and as we had to get back into the maelstrom of business on the following Monday morning, it was unanimously decided to leave Charlie and Hughey to ferry the Kittie across to Charlotte while we came over on one of the returning Thousand Island steamers.

"Well," said Carl, as we stood on the deck of the floating palace and waved our adieux to Hughey and Skipper Charlie, "we had a pretty good time after all."

Beck said that was a very good sentiment to drink to, and invited us below.

I disdained the toast, but silently following my friends down the grand staircase, I felt, with J. K. Jerome, that we were "three men well out of a boat."

Clarice—A Single-Hander.

BELIEVING that many amateur yachtsmen pay more than a passing thought to the development of the single-hander, we publish herewith a photograph taken of Clarice in a strong breeze, at Hull, during a regatta of the Boston Y. C. The wind was blowing at the rate of twenty miles an hour. This 18ft. single-hander was designed by Mr. Isaac B. Mills, of Boston, for Mr. Walter Burgess.

In Clarice are embodied the results of experience of one of the best all-round amateur yachtsmen in the country. Mr. Walter Burgess is as enthusiastic a devotee of real sailing as he was keen and ardent racing man in his earlier years; but, like many another real yacht sailor, he has grown apathetic toward the existing extreme racing yacht, and has been compelled,

THE SINGLEHANDER CLARICE.

for the sake of having a yacht easily managed under all conditions, to start out independently of yacht club rules and measurements, and have a yacht designed to suit his own ideas.

The points agreed upon with Mr. Mills were as follows:

First—A boat that would not pound.

Second—One that could be managed by one man alone.

Third—The largest boat that would fill the above requirement.

Fourth—An uncapsizable boat.

Fifth—A boat with a cabin giving good sitting head room and sleeping accommodations for two.

Sixth—A boat that would steer easily.

Seventh—A boat that would carry her sail in a fresh breeze.

Eighth—A boat that could be gotten under way in five minutes.

Ninth—A boat of strong construction, which, when pressed, would stand all strains and not leak.

Under the above conditions, Mr. Mills designed Clarice. Her dimensions are as follows:

Length—

Over all27ft.

L.W.L.18ft.

Extreme breadth8ft. 2in.

Extreme draft4ft. 6in.

Sail area450sq.ft.

Ballast (all outside).....1500lbs.

She has answered the purpose for which she was designed admirably. Her trial trip was made last November, from Marblehead to Boston in a strong N.W. wind blowing at the rate of 30 miles an hour. A breeze of this weight is just to her liking, and she handles perfectly under two-reefed mainsail and no jib.

Mr. Burgess cannot keep out of the racing, as it is in the family clean through. So he occasionally enters Clarice in the handicap classes.

The little craft, designed without a single idea of racing, has already made a creditable showing. She is quite good in light airs, her heavy weight serving to carry her along when lighter boats are hung up. She won the first place at Marblehead, Aug. 8, in the handicap class of the Boston Y. C.

One feature of the boat is well worthy of imitation in a single-hander. All the gear of the jib leads aft to the cockpit—the jib halliard, jib downhaul, jib burton and jib sheets; so that the sail can be set or taken in without going forward.

Bensonhurst Y. C.

BENSONHURST, L. I.,
Saturday, September 12.

The Bensonhurst Y. C. held a closed handicap regatta on the afternoon of Saturday, September 12. Twenty-one boats of all types started in the event. The winners on corrected time were Esperance, Chespa and Rascal. In awarding handicaps, age, sail area, and past performances were considered. This gave boats of all types, old or new, a chance to compete with some show of success.

The starters were divided into three classes. A was for sloops and yawls of new type, B for a like class of older boats, and C for mainsail yachts open or with cabin. Commodore A. C. Bellows offered fine cups to the winners in each class on corrected time.

The boats covered the usual Association course in reverse order, leaving all marks to port. A light wind from the S. E. was blowing. This gave the racers a run to the Marine and Field Club mark, a reach to Fort Hamilton, a beat to the mark off Sea Gate, and a reach home to the start off Ulmer Park. The journey was taken twice. The summary:

Sloops—Class A—Start, 3:03.			
	Finish.	Elapsed.	Corrected.
Esperance, T. A. Hamilton.....	4 31 13	1 28 18	1 07 18

Keystone Y. C.

RIVERTON, DELAWARE RIVER,
Saturday, September 5.

Although an unlucky number of boats started in the Keystone Y. C. regatta sailed on Saturday, September 5, all of them finished and there were no mishaps or accidents. Four classes filled and thirteen boats came to the line. The race was sailed in a fresh N. W. breeze, and the boats covered a four-mile course. The summary:

Skiffs—Start, 11:00.		Finish.
Laura C., Geo. Wheatcroft.....	12 10 30	
Alberta, J. Wilmington.....	12 10 55	
Jesse, J. Smith.....	12 14 45	
Second Class Duckers—First Race—Start, 11:15.		
Clown, John Hirst.....	12 36 30	
John Hirst, Stanley Collum.....	12 27 37	
Martha, John Derr.....	12 38 33	
Anna, Stanley Auskland.....	12 47 52	
First Class Duckers—Start, 1:16.		
Marie, Wm. Callum.....	2 32 30	
Bessie, Samuel Dongee.....	2 32 55	
Second Class Duckers—Second Race—Start, 1:34.		
John Hirst, Stanley Collum.....	2 52 40	
Martha, John Derr.....	2 57 10	
Clown, John Hirst.....	2 57 10	
Anna, Stanley Auskland.....	3 30 05	

The winners were Laura C., Clown, Marie and John Hirst.

Newport Special Thirties.

Saturday, September 5.

On Saturday the 30-footers raced for a cup offered by Mr. Winthrop Rutherford. The course was from Brenton's Cove to and around the Compass buoy in Codding-ton Cove and return. The wind was fresh from the S. W., making it a run out and a beat back. Carolina was first over the starting line, and led all over the course. The summary:

	Finish.	Elapsed.
Carolina, Pembroke Jones.....	4 35 54	1 10 54
Raccoon, J. R. Drexel.....	4 38 05	1 13 05
Vaquero III., Payne Whitney.....	4 38 40	1 13 40
Barbara, Winthrop Rutherford.....	4 41 06	1 16 06

The International Races.

Now that they are all over, including the shouting, how much better off are we than we were before? Have the contests for the America's Cup, the Seawanhaka cup, and the Canada's cup worked any permanent good to the sport, or added to our stock of useful information? So far as the major event is concerned, most yachtsmen will answer No. The America's Cup boats were the same costly useless toys that have served the purpose in the three last contests, and if any change was observable, the sport was duller than usual. Unless another challenger appears they will all be laid up or broken up. Fortunately, the owners can afford it, but it is a pity the enormous expense produces such small results.

Turning to the other events, the outlook is brighter and more practical. Both the Seawanhaka and Canada cup boats are ready for more good work, and the reason is simple and apparent—they were built under sensible restrictions covering both design and construction. This fact has been so little touched upon in the reports of the racing that it will bear further exposition.

It is now five years since restrictions were framed to apply to the boats for the Seawanhaka cup races. At that time the possibility of a general use of restrictions was under discussion, but it was not generally favored—some opposing it outright on the ground that it would be an unwarrantable interference with the freedom of design; others offering lukewarm support, and predicting that the restrictions would not restrict, and that to be effective they would necessarily lead to one-design classes. Since Seawanhaka cup boats were admittedly racing craft, and in no way required or intended for cruisers, the few restrictions applied to them were necessarily of a simple character intended to prevent the building of boats which would barely hold together for a few races. To this end, and in view of the fact that the class is essentially a live ballast one, sail area was restricted to 500 square feet, four men not exceeding in weight 650 pounds being allowed as crew. This for a 25-footer under the length and sail area rule allowed a waterline of over 27ft.—more than most designers would care to use. Draft was fixed at 5ft. for a keel boat (none have been used), and 6ft. including a centerboard, the latter not to exceed 450 pounds if of iron, or 300 pounds if of any other metal. A minimum thickness of 1/2 in. for deck and hull planking, with suitable requirements for framing, provided against dangerously light construction, while still permitting it to be light enough to require first-class work. Nothing whatever in the restrictions which are set forth in detail in about 250 words could be construed to needlessly hamper the designer, and yet the result has been the building up of a strong and useful class. Some twenty boats have been built during the last four seasons, several on the small Western lakes, some in the East, and perhaps half of them on Lake St. Louis; this latter group has hung together well, there being a sentiment in the Royal St. Lawrence Y. C. averse to disposing of good boats to outsiders, but in any case there has been no need to do so, the boats being generally useful on Lake St. Louis. As knockabouts for day sailing in shoal water they are really excellent. This season when Thorella and Kolutro were racing, with four men each, under reefed canvas, last year's champion, Trident, was carrying full sail and ten or a dozen passengers, young men and maidens, and carrying them comfortably. As designer Shearwood remarked, this is a little more than the construction was intended to stand, but all the ex-racers on Lake St. Louis have had to stand more or less of this sort of thing, and they appear none the worse. Nor are these boats, as a class, at all slow, a speed of 10 knots an hour was observed on a broad reach in this year's racing. What unlimited racing 25-footer of flimsy construction would do any better? Finally, a lot of cup boats and others cruised up to Kingston and back this summer. Of course they were towed through the canals, but there was plenty of sailing and some racing on the way. There is not much the matter with boats that can be put to such work. Of the challengers, it is not so easy to speak with certainty, as they are scattered over a wide area, but none of them were either wrecked or useless after a season's work. No man who wants a fast and handy sailboat need fear to build for the Seawanhaka cup.

Turning to the Canada's cup fleet, we find the original Canada still in commission, and both cruising and racing on Lake Ontario. For two seasons, with an off year between, the matches were sailed with boats of the 35ft. corrected length class, measured under the girth rule, and of these Genesee, Beaver and Cadillac are still fast and useful boats, although the only restrictions in use were those on construction. The class was, however, rather small for general work on the Great Lakes, and several boats built for the trial races on one side or the other were not kept up after the first season. Two years ago the Rochester Y. C. decided to challenge for the cup, and was prepared to send a boat last year of any size nominated by the holder, the Royal Canadian Y. C., the defending club having the right to name the class to be used. After friendly consultation, however, it was agreed that the permanent interests of the sport on the lakes ought to be considered, and as new rules with restrictions on design were about to go into effect, it was decided to wait a year and to build to suit them. The 40ft. waterline class was eventually selected, and but two boats built, the Irondequoit and the Strathcona. After examining these boats afloat and ashore, above and below, the average yachtsman rubs his eyes and wonders if the millennium has arrived. Moderate in every way and well proportioned, they are handsome and satisfying, but surely this comfortable freeboard and headroom under decks means the fast cruiser and not the racer. For comfort, accommodation, and seaworthiness, they compare with nothing so well as the best of the old 40ft. class that began with Minerva and practically ended with her, for it took so many boats to beat her that interest in the class had subsided by the time the thing was done. For ten years at least things have been going the wrong way, and it really looked as though another decade would be required to work back to the old position. But the thing has been done—these are the boats, cup boats at that—and if they are fast cruisers all well and good, but watch them sail in a race. Just how Strathcona has beaten everything of her size on Lake Ontario has been reported from time to time in FOREST AND STREAM. That she is

actually, as well as relatively, fast has been proved by her work alongside Gloria—a much larger boat—and, as we all know, Irondequoit is in every way equal to Strathcona, and sometimes a little better. No reasonable yachtsmen can doubt for a moment that these boats are fast and in every way a credit to their designers, while the fact that they are so evenly matched as to make every race a trial of seamanship and full of interest from start to finish simply shows that we are raising the sport to its proper level. It is a pity that Jarvis and Hanan could not sail a match off Sandy Hook, because it is so hard to make some people believe that real international racing ever takes place elsewhere.

Of course the new system is on trial, and the future may develop weak spots in unexpected places. Meanwhile we have had a splendid series of races and two yachtsmen have acquired boats that will afford them both sport and comfort for many seasons to come. It is worth mentioning in conclusion that Mr. Macrae, the owner of Strathcona, would not have built under the old rules at all, so that while the Royal Canadian Y. C. has parted with the Canada's cup (for the present), it has gained a good boat and a satisfied owner.

WM. Q. PHILLIPS.

American Y. C.

MILTON POINT, LONG ISLAND SOUND,

Saturday, September 5.

The American Y. C. held races for power boats on Saturday, September 5. In the morning there was an endurance race, and in the afternoon the speed trials took place. The racing was conducted under the rules of the American Power Boat Association.

The preparatory signal for the endurance race was given at 11:15, and the boats were sent away five minutes later. The course was from the starting line off Milton Point to and around the red and black horizontal spar buoy which lies to the north of Execution Light, and back to the starting line, a distance of seven knots. The boats covered this course three times, making a total distance of twenty-one knots. The eight boats were divided into two classes, but all started on the same gun. Express and Spark were disqualified. Standard ran away from the other boats, and won easily. Allure was second. The endurance race was decided on points. The highest number for a boat to secure was 100—50 for speed and 50 for performance of boat and engine. The 50 points allowed for performance were subject to the following deductions: Five points for each stop of motor or propeller for any cause; 5 points for each minute or fraction of a minute of any stop; 2 points for each adjustment of motor, dynamo, batteries, reversing gear, or other mechanism connected with the motive power of the boat except for lubrication; 50 points for a stop of five minutes' duration, and 50 points for three stops.

Eleven boats came to the line for the speed races in the afternoon; they were divided into five classes. The boats covered a ten and one-half knot triangular course. Queen Bess won in her class, but as many of the other boats had not been measured, the corrected times could not be figured. 999 broke down and could not go over the course. The summary follows:

Endurance Race, 21 Knots—Class 1—32 to 50ft—Start, 11:20.			
	Finish.	Elapsed.	Corrected.
Queen Bess, R. H. Stearns.....	1 39 18	2 19 18	2 19 18
Alester II., R. C. Fisher.....	1 49 39	2 29 39	1 59 10
Allure, Alex. Stein.....	1 03 40	1 43 40	1 42 04
Express, C. D. Mower.....	Disqualified.		
Howdy, Geo. Mercer, Jr.....	1 59 44	2 39 44	2 02 04
Clara, T. D. Hughes.....	2 06 55	2 46 55	Not meas.
Spark, E. D. Falford.....	Disqualified.		
Class 2—Over 50ft—Start, 11:20.			
Standard, E. A. Riotti.....	12 34 52	1 14 52	1 14 52
Speed Race—10 1/4 Knots—Class B—Start, 4:05.			
Allure.....	4 58 39	0 53 39	0 53 39
Onaway.....	5 31 38	1 26 38	Not meas.
Class C—Start, 4:10.			
Queen Bess.....	5 28 13	1 18 13	1 10 18
Alester II.....	5 30 47	1 20 47	1 20 47
Howdy.....	5 36 36	1 26 36	1 23 22
Class D—Start, 4:15.			
Clara.....	5 44 09	1 39 09	Not meas.
Class H—Start, 4:05.			
Standard.....	4 45 52	0 40 52	0 40 52
Express.....	5 06 56	1 01 56	Not meas.
Class K—Start, 4:15.			
American.....	5 10 07	Finished alone.	
999.....	Disabled.		

Indian Harbor Y. C.

GREENWICH, LONG ISLAND SOUND,

Saturday, September 5.

The autumn races of the Indian Harbor Y. C. were held on Saturday, September 5. There was a good list of starters, nearly forty boats coming to the line, but a nasty thunder squall rather spoiled the race, and one of the boats was dismasted.

The race was to have been started at noon, but at that hour it was very thick and foggy, and the Regatta Committee thought it advisable to postpone the start until half past two. At the time of the start the wind was light from the S. W., having a strength of not over five knots. Boats in the 36 and 30ft. classes sailed twice over a nine-mile course, the first leg of which was E. by N. 3 1/2 miles, the second S. W. 1/2 S. 3 1/4 miles, and the third N. W. by N. 2 1/4 miles.

None of the 43-footers were on hand, so the 36-footers were sent away first. Spasm beat Anotok for the first time this season. Cymbra was rather outclassed by the two modern Herreshoff boats; still she was not badly beaten.

Alert captured another first prize in the 30ft. class, beating Oiseau, the only other boat to finish, just two minutes. Mimosa and Naiad withdrew.

In the regular raceabout class there were four starters. Sis won by a narrow margin, beating Mavis, the second boat, by only six seconds.

Hobo had matters her own way in the American Y. C. raceabout class. Jolly Tar, the only other boat that finished, was badly beaten. Maryola, one of the boats in this class, had just rounded the second mark when the thunder squall broke out of the northwest; her mast broke off about ten feet from the deck, and after her rigging and sails had been secured she was towed into the harbor by the steam yacht Hanniel.

Firefly won in the 25ft. sloop class, and Robin Hood was second. Hourli was the only one of the Larchmont Y. C. 21-footers to start, and she withdrew. Pampero, one of the Seawanhaka knockabouts, had no competitor, but she covered the course and took a sailover prize.

There were three starters in the 21ft. sloop class. Neola won, and as Montauk did not finish, Jeebi was second. Only two of the Manhasset Bay one-design boats started, and Bab finished alone, as Arizona withdrew. Cape beat out her three competitors in the New Rochelle one-design class and got first prize.

When the boats finished the wind was E., it having shifted to that quarter after the squall. The Regatta Committee consisted of Messrs. Frank Bowne Jones, Charles Kirby, and Charles E. Simms. The summary follows:

Sloops—36ft. Class—Start, 2:40—Course, 18 Miles.			
	Finish.	Elapsed.	
Spasm, E. B. King.....	5 59 40	3 19 40	
Anotok, W. G. Brokaw.....	6 02 51	3 22 51	
Cymora, F. C. Henderson.....	6 09 38	3 29 38	
Sloops—30ft. Class—Start, 2:45—Course, 18 Miles.			
Alert, J. W. Alker.....	6 01 15	3 16 15	
Mimosa, T. L. Park.....	Withdraw.		
Oiseau, H. L. Maxwell.....	6 03 03	3 18 03	
Naiad, J. B. Palmer.....	Did not finish.		
Raceabout Class—Start, 2:50—Course, 12 Miles.			
Sis, F. T. Bedford, Jr.....	5 49 22	2 59 22	
Nathalie, F. G. Stewart.....	6 02 53	3 12 53	
Rogue, A. B. Alley.....	6 03 46	3 13 46	
Mavis, G. L. Pirie.....	6 49 28	2 59 28	
American Y. C. Raceabouts—Start, 2:50—Course, 12 Miles.			
Jolly Tar, Slocum Howland.....	6 01 08	3 11 08	
Hobo, T. L. Park.....	5 45 39	2 55 39	
Maryola, C. W. Allen.....	Dismasted.		
Sloops—25ft. Class—Start, 2:55—Course, 12 Miles.			
Firefly, G. P. Granbery.....	5 55 54	3 00 54	
Lotus II., Morgan Barney.....	6 19 22	3 24 22	
Chingachcook, E. A. Stevens, Jr.....	5 58 19	3 03 19	
Robin Hood, George E. Gartland.....	5 57 18	3 02 18	
Larchmont 25ft. Class—Start, 2:55—Course, 12 Miles.			
Hourli, J. H. Esser.....	Did not finish.		
Seawanhaka Knockabouts—Start, 2:55—Course, 12 Miles.			
Pampero, R. T. Bailey.....	6 04 26	3 09 26	
Sloops—21ft. Class—Start, 3:00—Course, 9 Miles.			
Jeebi, A. D. Beam.....	5 15 41	2 15 41	
Neola, J. R. Johnston, Jr.....	5 05 33	2 05 33	
Montauk, George P. Sheldon.....	Did not finish.		
Manhasset Bay T. C. Class—Start, 3:00—Course, 9 Miles.			
Bab, J. R. Hoyt.....	5 14 29	2 14 29	
Arizona, E. A. Corry.....	Did not finish.		
New Rochelle One-Design Class—Start, 3:00—Course, 9 Miles.			
Caper, P. L. Howard.....	5 12 05	2 12 05	
Knave, R. N. Bavier.....	5 27 25	2 27 25	
Deuce, Newbury D. Lawton.....	5 18 47	2 18 47	
Ace, A. Bavier.....	5 19 56	2 19 56	
Sloops—18ft. Class—Start, 3:05—Course, 9 Miles.			
Lobster, A. B. Brush.....	Did not finish.		
Louie Belle, J. M. Williams.....	6 07 18	3 02 18	
Ity Bity, W. E. Douglas.....	6 03 47	2 88 47	
Seawanhaka 15ft. Class—Start, 3:05—Course, 9 Miles.			
Mayita, George B. Watts, Jr.....	6 07 45	3 02 45	
Indian Harbor Y. C. Sailabouts—Start, 3:10—Course, 9 Miles.			
Noggin, W. Carney.....	5 22 21	2 12 21	
Bug, George F. Dominick.....	Withdraw.		
Stingy, Edward E. Zittel.....	5 16 14	2 06 14	
Hempstead Harbor Y. C. Class—Start, 3:10—Course, 6 Miles.			
Scud, D. B. Abbott.....	4 57 58	1 47 58	
Gosling, M. C. T. Pratt.....	4 57 48	1 47 48	

The winners were: Spasm, Alert, Sis, Hobo, Firefly, Pampero, Neola, Bab, Caper, Louie Belle, Stingy, and Gosling.

Jamaica Bay Y. C.

JAMAICA BAY, L. I.,

Monday, September 7.

The Y. R. A. of Jamaica Bay held a very successful regatta on Labor Day under the auspices of the Jamaica Bay Y. C. The wind was from the S. at the start, but it worked around to the W. before the boats finished, and lightened considerably.

The course for all sailing yachts was from the starting line, drawn from the dock of the Jamaica Bay Y. C., and a stake boat anchored a hundred yards off shore; thence to a stake boat anchored off Rockaway Park dock; thence to a stake boat anchored in Broad Channel; thence to starting line.

The course for launches was from the starting line to the red can buoy in Rockaway Inlet; thence to a stake boat anchored in Broad Channel; thence to starting line, sailed over once. The summary follows:

Sloops—20 to 30ft.—Start, 2:04.			
	Finish.	Elapsed.	
Marion.....	4 36 38	2 32 38	
Jennie.....	4 35 40	2 31 40	
Yank.....	Disabled.		
Kismet.....	Did not finish.		
Folly.....	Disabled.		
Baby Roger.....	5 18 16	3 14 16	
Lassie.....	5 26 30	3 22 30	
Cabin Cats Under 25ft—Start, 2:14.			
Matilda.....	Did not finish.		
Diana.....	5 25 51	3 11 51	
Louise.....	Disabled.		
Irene.....	Disqualified.		
Shadow.....	5 15 36	3 01 36	
Open Cats—25ft. and Under—Start, 2:18.			
Ariel.....	5 07 32	2 49 32	
Bill Nye.....	Did not finish.		
Aurora.....	4 56 37	2 38 37	
Minnehaha.....	Disabled.

Open Cats—17 to 20ft.—Start, 2:20.			
Doctor.....	5 41 44	3 21 44	
Vision.....	5 26 22	3 22 30	
Celine.....	Did not finish.		
Avocat.....	Not timed.		
Open Cats Under 17ft.—Start, 2:22.			
Free.....	Disabled.		
Charlie D.....	5 54 23	3 32 23	
Alert.....	5 51 00	2 29 00	
Launches.			
	Start.	Finish.	Elapsed.
Gracie.....	2 28 01	4 07 32	1 39 31
Eckford.....	2 28 15	3 57 30	1 28 15
Wave.....	2 28 47	Did not finish.	
Rockaway.....	2 28 03	3 57 46	1 29 33
Nadine.....	2 28 26	4 04 20	1 35 54
Anna M.....	2 28 07	3 59 00	1 30 53
Seba.....	2 28 01	3 59 50	1 31 49

The winners were Jennie, Shadow, Selfish, Vision and Alert.

At a meeting of the Shelter Island Y. C. held on September 5, the following officers were elected: Com., George F. Little; Vice-Com., Arthur C. Whitney; Fleet Surgeon, Dr. J. L. Keep; Treas., George H. Bradley.

Atlantic Y. C.
SEA GATE, L. I.,
Monday, September 7.

The Atlantic Y. C. held a regatta on the afternoon of Labor Day, September 7. Twenty-four boats of all classes started, all but two of which finished. The winners were Bagheera, Cockatoo, Trouble, Opossum and Martha M.

Nearly all of the classes filled well and competition in each was spirited. Class N. went once over a course with turning marks at Craven Shoal Buoy and West Bank Light. The start was off Sea Gate. A light but steady breeze from the south gave them windward work to the first mark, a close reach to the second, and a broad reach home.

The other starters twice covered the regular inside courses. They had a close reach to Fort Hamilton Buoy, a spinnaker run to the Marine and Field Club mark, a reach to the white buoy off Ulmer Park, and another reach to the start and finish off Sea Gate. The two class P boats, Ogeemah and Smoke, entered protests against each other for crowding at one of the marks. A meeting of interested parties was held on Saturday, September 12. The protest was decided in favor of Ogeemah. Smoke was disqualified. The summary:

Class N—Start, 3:25.		
	Finish.	Elapsed.
Bagheera, H. Chubb.....	4 56 15	1 31 15
Bobtail, E. F. Luckenbach.....	4 57 15	1 32 15
Vivian II., S. E. Vernon.....	4 59 38	1 34 38
Class P—Start, 3:30.		
Cockatoo, W. A. Barstow.....	5 07 04	1 37 04
Karma, J. C. Erskine.....	5 16 03	1 46 03
Vagabond, T. A. Vernon.....	5 10 12	1 40 12
Smoke, L. H. Dyer.....	Disqualified.	
Kate, yawl, J. S. Negus.....	Did not finish.	
Ogeemah, Brophy & Mackay.....	5 09 45	1 39 45
Corona, J. E. Boggs.....	5 20 00	1 50 00
Lizana, Wylie & Archer.....	5 11 55	1 41 55
Class Q—Start, 3:35.		
Careless, F. J. Havens.....	5 27 40	1 52 40
Mary, M. Grundner.....	5 21 13	1 46 13
Wraith, C. Tompkins.....	Disqualified.	
Trouble, W. H. Childs.....	5 15 52	1 40 52
Spots, D. D. Allerton.....	5 25 25	1 50 25
Cicada, A. O'Neill.....	5 28 30	1 53 30
Class R—Start, 3:35.		
Scalawag, E. S. Ludlow.....	Did not finish.	
Sandpiper, W. W. Redfern.....	5 20 30	1 45 30
Opossum, R. P. Doremus.....	5 16 48	1 41 48
Constance, F. D. Prentiss.....	5 28 40	1 53 40
Pecunia, G. H. Church.....	5 34 30	1 59 30
Class V—Start, 3:40.		
Martha M., R. Moore.....	5 22 47	1 42 47
Rascal, D. G. Whitlock.....	5 22 27	1 42 27

Seawanhaka-Corinthian Y. C.
OYSTER BAY, LONG ISLAND SOUND,
Thursday, September 10.

The first of the three days' racing given by the Seawanhaka-Corinthian Y. C. was held on Thursday, September 10. There were nine starters in the raceabout class and six starters in the 15ft. class. A good sailing breeze from the S. held throughout the contest. The course was from the starting line N. N. W. two miles to and around a mark boat, thence E. ½ N. two and one-quarter miles to and around a mark boat, thence S. W. by S. two and one-half miles back to the starting line, a distance of six and three-quarter knots. The raceabouts sailed over this course twice, while the 15-footers went around but once. The first leg was a run, the second a reach, and the third a beat.

In the raceabout class Rascal and Jolly Roger fought it out from start to finish, and the former won out by 51 seconds. Cayenne had an easy time beating the other boats in the 15ft. class, and she finished with minutes to spare. She beat Bobs, the second boat, 2m. 27s. The summary:

Raceabout Class—Start, 12:05—Course, 13½ Miles.

Rascal, S. C. Hopkins.....	2 57 46	2 52 46
Hobo, T. L. Park.....	3 01 33	2 56 33
Jolly Roger, T. B. Bleeker.....	2 53 37	2 53 37
Jolly Tar, Slocum Howland.....	3 05 04	3 00 04
Maryola, C. W. Allen.....	3 08 29	3 03 29
Mavis, G. Pirie.....	3 07 30	3 02 30
Nathalie, F. G. Stewart.....	3 16 56	3 10 56
Rogue, A. B. Alley.....	3 27 14	3 22 14
Galatea, Anson P. Stokes.....	3 50 30	3 45 30

15ft. One-Design Class—Start, 12:30—Course, 6¾ Miles.

Cayenne, Colgate Hoyt.....	2 16 50	2 11 50
Bobs, W. A. W. Stewart.....	2 19 17	2 14 17
Wee Wean, J. C. Work.....	2 21 20	2 16 20
Vivian.....	2 32 25	2 27 25
Imp, Henry H. Landon.....	2 20 33	2 15 33
Bairn, W. J. Matheson.....	Did not finish.	

The winners were Rascal and Cayenne.
Friday, September 11.

Fifteen boats started in the second of the three days' racing at Oyster Bay. All the boats were manned by amateurs. The breeze was light from the N. W., but shifted somewhat when the boats were on the second round. The course was the same as was sailed in Thursday's race. In the first division of the raceabout class there were two starters, Hobo and Maryola. The former won out by over a minute. Rascal and Jolly Tar were the only starters in the second division of the raceabout class. Jolly Tar was beaten by less than a minute.

There were four starters in the general class of raceabouts. Galatea, Mr. Anson Phelps Stokes' new boat, made her second start, and showed up to better advantage than she did in Thursday's race, when she was hopelessly beaten. Nathalie and Mavis put up a good race and Nathalie won.

In the first division of the 15ft. class Sabrina scored an easy victory over Cayenne. In the general division of the 15ft. class five boats started. Bobs won and had an easy time defeating the other boats. The summary follows:

First Division—Class O—Raceabouts—Start, 12:05—Course, 13½ Miles.

Maryola, C. W. Allen.....	2 26 02	2 21 02
Hobo, T. L. Park.....	2 24 42	2 19 42

Second Division—Class O—Start, 12:10—Course, 13½ Miles.

Rascal, S. C. Hopkins.....	2 26 15	2 16 15
Jolly Tar, Slocum Howland.....	2 27 18	2 17 18

General Class—Start, 12:15—Course, 13½ Miles.

Galatea, Anson P. Stokes.....	2 33 01	2 18 01
Mavis, G. Pirie.....	2 30 01	2 15 01
Nathalie, F. G. Stewart.....	2 29 00	2 14 00
Rogue, A. B. Alley.....	2 36 29	2 21 29

First Division—15ft. Class—Start, 12:20—Course, 6¾ Miles.

Cayenne, Colgate Hoyt.....	1 43 32	1 23 32
Sabrina, C. W. Wetmore.....	1 40 12	1 20 12

General Division—15ft. Class—Start, 12:30—Course, 6¾ Miles.

Bobs, W. A. W. Stewart.....	1 48 55	1 18 55
Wee Wean, J. C. Work.....	1 50 00	1 20 00
Bairn, W. J. Matheson.....	1 50 52	1 20 52
Imp, Henry H. Landon.....	1 52 15	1 22 15
Olita, Henry C. Rouse.....	1 49 04	1 19 04

The winners were Hobo, Rascal, Nathalie, Sabrina, and Bobs.

Manhasset Bay Y. C.
FALL REGATTA,
Saturday, September 12.

The fall regatta of the Manhasset Bay Y. C. was sailed on Saturday, September 12, over that club's outside course from the northeast Execution Buoy, thence to Parsonage Point, thence to Red Spring Point and back to the starting line, all classes, 36ft. and above, going over the course twice, and the smaller boats once.

Owing to the very unsatisfactory racing had this season, to insure a reasonably good entry list, the date of these races was advanced one week by arrangement with the Seawanhaka-Corinthian Y. C., and even at this but twenty-three entries qualified at the starting line. The 30ft. class and raceabouts were not scheduled, as these classes were to race at the Seawanhaka-Corinthian Y. C.

As the 65ft. and 43ft. classes did not fill, a race was arranged between the Neola and Effort on time allowance, while a match was also made between the one-design Purdon boats, Umbrina and Rondinella.

The race was started at one o'clock in a light N. E. wind, Neola and Effort, by agreement, carrying working topsails. Effort got the best of the start and held the advantage almost to the finish of the first round, when, with both boats almost at the mark, she worked up on Neola and managed to squeeze in between her and the stake boat. On the second round the breeze freshened, with the result that Neola, while finishing considerably ahead of Effort, could not save her time. The cruisers Umbrina and Rondinella were started at three o'clock, and went over the line with Umbrina slightly in the lead, which position she held throughout the race. It is to be regretted that a stronger breeze was not had, in order that these boats could have had a better opportunity to show their quality.

In the 25ft. class, the Chingachook, for some reason, did not reach the line in time for the start of her class, as a result of which the owner of Firefly showed the sportsmanlike material in his make up by waiting twenty minutes for his competitor, and then, as he deserved, won out by a little over a minute.

In the 36ft. class, Spasm led the way over the course for most of the distance, but eventually was beaten by Anoatok, Leda being a tailender from start to finish. In the 21ft. class, Montauk won out over Gazabo, these two being the only boats in the class.

The winners in the various classes were Effort, Anoatok, Umbrina, Firefly, Hour, Cap, Arizona, Montauk, Flim Flam, and Wriggle, the following being the official record of the races.

Sloops—Special Class—Start, 1:05—Course, 21½ Miles.			
	Finish.	Elapsed.	Corrected.
Neola, G. M. Pinchon.....	6 09 56	5 04 56	5 04 56
Effort, F. M. Smith.....	6 23 17	5 18 17	...
Sloops—36ft. Class—Start, 1:15—Course, 21½ Miles.			
Leda, S. H. Mason.....	Did not finish.		
Spasm, E. B. King.....	6 52 07	5 37 07	...
Anoatok, W. G. Brokaw.....	6 51 26	5 26 28	...
Sloops—Special Class—Start, 3:05—Course, 10¾ Miles.			
Umbrina, W. H. Childs.....	6 44 53	3 39 53	...
Rondinella, F. H. Duval.....	6 48 53	3 43 53	...
Sloops—25ft. Class—Start, 1:25—Course, 10¾ Miles.			
Chingachook, E. A. Stearns.....	5 20 25	3 55 25	3 55 25
Firefly, G. P. Granberg.....	5 24 13	3 59 13	3 54 11
Larchmont 21-footers—Start, 1:20—Course, 10¾ Miles.			
Adelaide, J. J. Dwyer.....	4 42 42	3 22 42	...
Hour, J. H. Esser.....	4 32 47	3 12 47	...
Dorothy, L. G. Spence.....	4 46 54	3 26 54	...
New Rochelle Class—Start, 1:30—Course, 10¾ Miles.			
Caper, P. L. Howard.....	5 41 19	4 11 19	...
Dulce, N. D. Lawton.....	5 57 00	4 21 00	...
Manhasset Raceabouts—Start, 1:30—Course, 10¾ Miles.			
Arizona, G. A. Corry.....	5 39 53	4 09 53	4 09 53
Bab, R. Hoyt.....	5 45 47	4 15 47	4 15 47
Lambkin, S. W. Roach.....	5 50 42	4 20 42	4 20 42
Falcon, Colin Stevens.....	5 48 12	4 18 12	4 18 12
Seawanhaka Knockabouts—Start, 1:25—Course, 10¾ Miles.			
Wriggle, G. S. Wilson.....	5 32 09	4 07 09	...
21ft. Sloops—Start, 1:25—Course, 10¾ Miles.			
Gazabo, H. Vulte.....	5 30 49	4 05 39	...
Montauk, G. P. Sheldon.....	4 47 22	3 22 22	...
18ft. Sloops—Start, 1:35—Course, 10¾ Miles.			
Plover, H. Place.....	5 18 02	3 43 02	...
Flim Flam, A. D. Prince.....	5 13 12	3 38 12	...

Atlantic Y. C. Ocean Race.
September 7 to 13.
524 MILES.

One of the longest ocean races ever held on this side of the water was started at 12:30 P. M. Labor Day, September 7, under the auspices of the Atlantic Y. C. The journey led from the start off Scotland Lightship to Nan-tucket Shoal Lightship, thence to Northeast End Lightship off Cape May and back to the finish at the point where the event was started.

Six able schooners entered. Morton F. Plant's Herreshoff creation, Ingomar, won, finishing on Thursday, over 21 hours ahead of Hildegarde, owned by Ed. R. Coleman, which ended the journey Saturday. George Lauder's Endymion and J. G. N. Whittaker's Iroquois finished on Sunday in the order named. Dr. L. M. Stimson's Fleur de Lys was reported in tow from Northeast End Lightship. Commodore Robert E. Tod's Thistle withdrew from the contest on Tuesday.

The boats had baffling conditions of wind and wave which made the race a hard one, and each contender deserves great credit for persevering in the event. Until reports from each boat are made it will be impossible to give official figures. A full account of the race will appear in the next issue of FOREST AND STREAM.

The annual meeting of the Northport Y. C. was held on the evening of September 5, and the following were elected officers: Com., J. B. Morrell; Vice-Com., Charles A. Van Iderstine; Sec'y, H. Davis Ackerly; Treas., Murray S. Brown; Trustees, J. B. Morrell, Charles A. Van Iderstine, H. Davis Ackerly, Murray S. Brown, Edward Thompson, N. S. Ackerly, J. W. Hiltman, D. P. Morse, and John J. Burton.

Yacht Sales.

Mr. Stanley M. Seaman, New York, has made the following transfers:

Mr. W. E. Haskell, Larchmont Y. C., has exchanged his 70ft. w. l. schooner yacht Ivanhoe for the steam yacht Sentinel, owned by Mr. E. D. Thayer, Eastern Y. C., Boston, Mass. Sentinel is to be used in local waters until late in the season, and Mr. Thayer contemplates a West Indian cruise in the Ivanhoe this winter.

The same agency has also sold the steam yacht Bostonia for Mr. Chas. F. Berry, Boston, Mass., to Messrs. Bayer Bros., of this city, acting for Mr. T. T. Lovelace, of Baranquilla, Colombia, S. A. She is a steel boat, designed and built in 1901 by Geo. Lawley & Son, Corp., 74ft. o. a., 12ft. beam, 3ft. draft. Will be shipped via Hamburg American Line September 25.

Mr. Geo. J. Fermier, of Jersey City, N. J., has purchased the 31ft. catboat Numa from Mrs. Reba G. Van Pelt and Mr. J. Irving Simonson.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

The Board of Governors of the Brooklyn Y. C. held a meeting on Wednesday evening, September 2, to act upon the resignation of Commodore Cook. The resignation was accepted and Vice-Commodore Fontaine was elected commodore. Mr. Maxwell was chosen to succeed Mr. Fontaine as vice-commodore.

At the annual meeting of the Newport Y. R. A., held on September 7, the following officers were elected to serve one year: Governors, George L. Rives, Elbridge T. Gerry, Royal Phelps Carroll, John Jacob Astor, Winthrop Rutherford, Reginald Brooks, Harry Payne Whitney, Arthur T. Kemp, Herman B. Duryea, Max Agassiz, Woodbury Kane, Frederick P. Sanders, W. K. Vanderbilt, Jr.; John R. Drexel and F. K. Sturgis.

Race Committee—Herman B. Duryea, Max Agassiz, Woodbury Kane, H. O. Havemeyer, Jr.; Royal Phelps Carroll, Reginald Brooks and Winthrop Rutherford.

Intrepid, the new auxiliary schooner built for Mr. Lloyd Phoenix, was launched from the yard of the builders, Messrs. T. S. Marvel & Co., at Newburgh, on Tuesday, September 8. The yacht is built throughout of steel, and is 17ft. 8in. over all, 125ft. waterline, 28ft. breadth, and 16ft. draft. She is rigged as a three-masted schooner, and has seventy tons of outside ballast. This yacht will replace the old Intrepid, which Mr. Phoenix sold recently.

A cable report from England gives notice of the death of Mr. Arthur E. Payne, of the firm of Messrs. Summers & Payne, Southampton, England. Mr. Payne was one of the best known and most successful designers of yachts in Great Britain. During his career he turned out some two hundred yachts, the largest of which was Glory, a 205 ton yawl. Mr. Payne's boats are well known to American and Canadian yachtsmen. The Canada cup boats, Beaver, Invader, and Strathcona, were all from his board. Summers & Payne's yard at Southampton is a large one, and many famous yachts have been built there.

Reliance has been hauled out at Jacob's Yard, City Island, where she will occupy winter quarters. Before hauling, her mast and spars were removed and her sails and other gear were stowed in the storehouses. Piles are being driven in order to make a foundation for Reliance that will not settle. Columbia has been hauled out at Hawkins' Yard, and Constitution will occupy a berth at New London.

Yachtsmen in the vicinity of Patchogue, Long Island, held a meeting on Thursday, September 3, for the purpose of organizing a yacht club. The idea met with general approval, and thirty men signified their intention of joining. The officers of the new club are as follows: Com., Joseph Bailey; Vice-Com., A. Rae Storms; Rear-Com., George L. Robinson; Treas., Senator Bailey; Sec'y, Frank Guttridge. Committee on Constitution and By-Laws—J. C. Brackenbridge, George L. Robinson, James R. Skinner, E. J. Eisman, J. N. Silsbe, William E. Ebbetts, L. B. Green. Building Committee—J. C. Brackenbridge, S. B. Ogden, G. G. Roe, J. J. Robinson, Frank Guttridge.

Captain Robert Wringe has decided to make his home in the United States, and is to become a citizen. Captain Wringe, who is one of the ablest skippers in England, has had considerable experience in American waters, and he will have no difficulty in getting a berth in one of our best boats next season. He came out here in 1899 on the first Shamrock, and the year following he sailed the 70-footer Mineola. In 1901 he was in the first Shamrock. When the big Fife schooner Cicely came out last year he was put in charge and she had a very successful season. Captain Wringe is a very capable racing skipper, and even though his handling of Shamrock III. in the recent races against Reliance has been criticised, there are few men his equal.

Shamrock I. and Shamrock III. are both to be hauled out at Erie Basin, South Brooklyn, where they will have berths close by Shamrock II. Sir Thomas Lipton decided not to take the boats back to England, but to keep them here and dispose of them if possible. Shamrock II. is to be sold for junk and broken up, as chemical action has caused her plating to rust and corrode. The big tug Cruiser left New York for the Clyde a few days ago. The steam yacht Erin is the only one of Sir Thomas' fleet left in commission.

New Books.

"The Beagle" treats of the history, breeding, rearing, training, showing and kennel management of the diminutive hound, and is the joint authorship of Messrs. James M. Pulley, John A. Tatham, Louis Steffen, Chas. F. Brooke, James McAleer, Ernest L. Jones, A. Henry Higginson, F. B. Lord and Reno B. Cole, the latter filling the office of editor. It is generously illustrated with pertinent matter. It contains 193 pages, is bound in cloth, and with so many practical men as authors, it necessarily contains valuable instruction and information.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

New York C. C.

BENSONHURST, L. I.,
Saturday, September 12.

The thirty-third annual fall regatta of the New York Canoe Club was held on the afternoon of Saturday, September 12, before a large crowd of spectators. Seven events were run off in conditions exactly suited for canoeing. The winners in the different races were F. C. Moore, C. F. Siedel, W. Inslee, George McTaggart, C. H. Parsons, Cromwell and Keller. The summary:

Decked Sailing Canoes—Start, 3:15.		
	Finish.	Elapsed.
F. C. Moore.....	4 03 25	0 48 25
George McTaggart.....	4 09 45	0 54 45
D. B. Godsell.....	4 11 15	0 56 15
Open Sailing Canoes—Start, 3:25.		
C. F. Siedel.....	4 00 07	0 35 07
A. M. Poole.....	4 01 40	0 36 40
E. J. Wright.....	4 02 10	0 37 10
R. S. Foster.....	4 02 15	0 37 15
J. F. Plummer.....	4 02 55	0 37 55
W. Carnalt.....	4 04 33	0 39 33
L. B. Jennings.....	4 04 40	0 39 40
B. V. R. Spidel.....	4 05 10	0 40 10
William Velland, Jr.....	4 05 55	0 40 55
A. Wilmarth.....	4 07 00	0 42 00
R. S. Hawthorne.....	4 09 05	0 44 05
H. H. Morton.....	4 08 50	0 43 50
Special Open Sailing Canoes—Start, 3:35.		
W. Inslee.....	4 08 25	0 33 25
George Morrissey.....	Disabled.	
Open Canoe—Tandem Paddling, Single-Blade—Start, 5:52:35.		
McTaggart and Inslee.....	5 56 30	0 03 55
B. Spidel and Poole.....	Not timed.	
Wright and Jennings.....	Not timed.	

Gunwale Race—Won by George McTaggart, W. Inslee, second; A. M. Poole, third.

Tilting Tournament—Won by Cromwell and Keller, Knickerbocker Canoe Club; Wright and Inslee second, Poole and B. Spidel third.

Tail End Race—Won by C. H. Parsons, W. Inslee second, A. Wilmarth third.

A. C. A. Constitution.

In the last issue of your paper I notice that three members are appointed to revise the constitution and by-laws of the American Canoe Association. So far, so good; but all three members of said committee are appointed from the Atlantic Division. Is it fair to the other divisions to have all from one division? It has been argued that it is better to have it thus because otherwise there might be loss of time in getting together to accomplish the revision. Why this haste? We have lived a good many years under the present constitution, and have had very little trouble. Of course the above is by no means perfect and should be revised, but a hasty revision might in the end prove disastrous to the interests of the Association. A mail vote can be taken at any time, and perhaps the incoming commodore might have a few suggestions to make. In my opinion the other divisions should have some say in the matter.

A MEMBER OF THE ATLANTIC DIVISION FOR 16 YEARS.

Rifle Range and Gallery.

Rifle at Sea Girt.

THE Leech cup match was open to everybody; distances 800, 900 and 1,000yds.; position, any without artificial rest; seven rounds at each distance without sighting shots; and rifle and ammunition; entrance \$1 to members of the N. R. A., and \$2 to all others; prizes, first, Leech cup and gold badge; second, \$25; third, \$15; fourth, \$10; fifth, \$5.

It was won by Corp. C. B. Winder, of Sixth Ohio, with a score of 94; Keough, of Massachusetts, also had 94, but was outranked by Winder; Upton, of Massachusetts, was third with 91. The scores:

Pennsylvania.				
	800yds.	900yds.	1000yds.	Tot'l.
Kemp.....	28	30	32	90
Jeffords.....	28	28	29	85
Goddard.....	24	21	27	82

Hare.....	2	20	28	50
Gensch.....	23	32
Hudson.....	18	11
Lewes.....	32	23

The inter-club match was for the rifle club championship of the United States. It was open to teams of five men from any rifle club or Association; ten shots per man at 200yds.; any rifle and ammunition. It was won by the Manhattan Rifle and Revolver team with a score of 213. The rifle club of the Seventh Regiment, New York, was second with 197, and Old Guard, Massachusetts, third with 195. The scores follow:

Manhattan Rifle and Revolver Association.....	213
Seventh Regiment, New York, Rifle Club.....	197
Old Guard, Massachusetts.....	195
Seventy-first, New York, first team.....	193
Twelfth New York.....	192
Company A, Sixth Massachusetts V. M.....	192
Seventy-first New York, second team.....	192
Pennsylvania State Rifle Association.....	190
Massachusetts Rifle Association.....	188
First Regiment New Jersey.....	187
Manhattan Rifle and Revolver Association, second team.....	180
Cottage Rifle and Revolver Association.....	179
Fourth New Jersey.....	177
Old Guard, New York.....	171
Squadron A, New York, withdrew.....	131

The president's match, for the Military championship of the United States, 200, 300, 500, 800 and 1,000yds., 7 shots at each distance, was won by Lieut. K. V. Casey, of the Seventy-first New York. There were ten prizes: To first the championship medal and \$50; to second, \$25; to third, \$15; to fourth, \$10; to fifth, \$10, and five more of \$5 each. The winners:

Yards:										
	200	300	500	600	800	1000				
Lieut. K. V. Casey, 71st N. Y.....	28	32	33	33	35	31	192			
Sergt. A. Corbett, 71st N. Y.....	28	31	35	33	32	29	183			
Lieut. A. E. Ranney, 71st N. Y.....	30	33	33	31	32	26	185			
G. E. Cook, District of Columbia.....	31	30	33	31	35	25	185			
Lieut. W. A. Tewes, New Jersey.....	30	31	35	30	29	29	184			
E. J. Fink, District of Columbia.....	28	32	33	33	29	28	183			
S. B. Wetherald, District of Columbia.....	27	29	33	34	32	26	183			
Sergt. J. Corrie, New York.....	32	29	33	33	32	24	183			
M. Appleby, District of Columbia.....	29	31	34	34	32	22	182			
W. I. Ligeat, Pennsylvania.....	31	30	34	29	29	28	181			

The all comers' military match was won by Lieut. W. M. Farrow, District of Columbia; Kuser trophy, rapid-fire match, was won by John L. Kuser, New Jersey; Reading trophy, Capt. D. B. McAlpin, Seventh New York; Spencer trophy, Pvt. Geo. E. Cook, District of Columbia; Seabury trophy, Sergt. J. H. Keogh, Massachusetts; hyposcope match, Lieut. Edward Breeze, Second New Jersey.

Members' match, New Jersey State Rifle Association—Lieut. Florace M. Bell, Second New Jersey.
Meaney medal—Sergt. Charles Moore, Pennsylvania.
Perrine medal—Pvt. H. J. McCartney, Fourth New Jersey.
New Jersey State Rifle Association trophy—Lieut. R. L. B. Bowen, Rhode Island.

The National match was open to teams of twelve men, one team from the troops stationed within each of the military departments; the United States Navy and Marine Corps; the National Guard (one team from each State, Territory and the District of Columbia); distance 200, 500, 600, 800, 900 and 1,000yds.; ten shots at each range by each contestant; arms, United States service rifles and carbines; service ammunition; to first National trophy and cash, \$500; to second, "the Hilton trophy" and \$300; to third, "the Soldier of Marathon" and \$200; to fourth, \$150; to fifth, \$100; to sixth \$50, and a medal to each member of the winning teams.

An Excellent Suggestion.

NORTH SUTTON, N. H., Sept. 5.—Editor Forest and Stream: Every one admits that it is of great importance for the country that its men should be expert rifle shots. Everything should be done to further this object. Would not the interest in rifle shooting among civilians be increased if the State or general Government were to offer badges as marksmen and sharpshooters to any one making a certain score? Such badges are eagerly competed for among the militiamen, and it seems to me that some plan can be perfected which would cause many a young man to practice at the range.

If this idea is an abandoned one, drop this in the wastebasket. If not, it is worth considering, as are any ideas which may help to bring up the standard of American marksmanship.

HARRY SEYMOUR BARNES.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of the Cincinnati Rifle Association on Aug. 30, the following scores were made. The shooting of Hasenzahl and Payne was good, considering a very tricky rear fishtail wind. Scores made at 200yds., offhand, 25-ring target:

	Hasenzahl	Payne	Nestler	Lux	Freitag	Bruns	Odell	Roberts	Hofer
225	219	217	216	205	217	214	217	194	182
222	221	218	213	211	217	215	208	206	199
222	219	213	210	207	217	212	207	197	196
217	210	206	206	201	217	210	203	201	197
217	194	187	184	182	217	215	208	206	199
217	194	187	184	182	217	215	208	206	199
217	194	187	184	182	217	215	208	206	199
217	194	187	184	182	217	215	208	206	199
217	194	187	184	182	217	215	208	206	199

Mr. Nestler was out again after waiting for his new Stevens finger lever. His shooting seems improved with its use.

The Old Guard.

NEW YORK.—The Engineers' Corps of the Department of New York Minute Men, is to participate in the fair to be held in New York next October by the Old Guard Veteran Battalion. Madison Square Garden will be used, and in this connection it may be interesting to know that 200 members of the Honorable Artillery Company of London will attend, the guests of the Ancient and

Honorable Artillery of Boston. The latter will attend about 250 strong.

It is purposed that Thursday, Oct. 8, will be Minute Men's night, and at that time will be seen the Washington turnout, which should be large in number and make a fine showing, considering that the headquarters of this organization is in the Capital City, presided over by Col. M. A. Winters.

Presque Isle Rifle Club.

ERIE, Pa., Aug. 29.—There were not many members of the Presque Isle Rifle Club present on Saturday, but those that were there made very good scores, considering the gait that a heavy north wind blew straight in the shooter's face. American Standard target, distance 200yds. Scores:

*B Moorehouse.....	36	30	42	108	S C Long.....	69	67	67	203
F G Lynch.....	84	79	74	237	J Almeda.....	69	64	56	189

J Bacon.....	77	73	68	218	*O S Riblet.....	42
A Mount.....	69	69	69	207					

Sept. 5.—The club held its regular weekly shoot with a very good attendance, and some good scores were made. Next Monday, Labor Day, the club shoots its long-promised match with the Jamestown, N. Y., Club, each club shooting on its own grounds and having a member of the other club present to see that the scores claimed are made. Scores:

J Stidham.....	78	75	75	228	J Almeda.....	63	63	60	192

*Visitors.

The last match of the three that was to be shot between the Pearl City Club, of Jamestown, N. Y., and the Erie Club was shot on Labor Day, each club shooting on its own grounds, having a representative of the other club present to see fair play, and the Erie Club won the final match and the cup that was shot for. The first match was shot at Jamestown last June, and the Jamestown club won. The second match came off on the Erie club's grounds on July 11, the Erie club winning. Erie's end of the third match was shot here during a rain that kept falling all afternoon, but nevertheless enough points were made to keep the cup here. Scores:

WESTERN TRAP.

HENRY RCOD, Sec'y,

Lynchburg Tournament.

LYNCHBURG, Va.—The tournament of the Virginia Trapshooters Association was a gratifying success. It was held on Sept. 7 to 9.

The championship event was shot on the second day and was won by Hatcher. He tied with Daniel, and on the shot-off, 25 targets, he broke 23 to the 21 of Daniel. In the gun event, distance handicap, P. H. Johnson was high with 24.

The five-man team contest was won by Bristol with 222 out of a possible 250:

Sept. 7, First Day.

Springfield Shooting Club.

THE annual fall tournament of the Springfield, Mass., Shooting Club was held on Labor Day, Sept. 7, on the club grounds, near Red House Crossing. Some thirty gun enthusiasts were with us, and a large crowd of spectators, including several ladies, who were much interested in the shooting, especially that of their husbands, as several of the shooters brought their wives with them to see the sport. Many out-of-town clubs were represented, some coming from as far away as New York city, New Haven, Boston and Leominster, Mass. The manufacturers' agents, who are usually with us at our tournaments, were not on hand this time, having engagements in other places, with the exception of Mr. Richards, who did some good shooting. The day was perfect for shooting, with scarcely any wind, which is very unusual for these grounds.

The shooters, being new to shooting over Sergeant system of trapping, did not make any very large score, and many "goose-eggs" appeared on the blackboard. Among those who did the best shooting were Barstow, of Rockville, Conn.; Schortemeier, of New York city; Stacy, of Belchertown, Mass.; Bradley, of Bridgeport, Conn.; Mack, and Highwood, of New Haven, and Lovering, of Boston. One string of 20 straight by Barstow was the highest score made in any one event.

All events were shot from the 16yd. mark, at known traps and unknown angles. It was the intention to have all events shot from unknown traps and unknown angles, but this proved too much for the trappers, and known traps were used, being pulled in rotation. There was one shooter absent who usually attends our tournaments and whose bright smile and cheery word were much missed, Mr. B. Leroy Woodard, who passed away on Aug. 9 at his home in Campello, Mass. Mr. Woodard was a great favorite among the members of this club, and he was missed by many.

The special merchandise prizes offered for the four high guns shooting the entire programme were won by the following:

1. Gold badge, won by H. E. Barstow, of Rockville, Conn.
2. Lancewood trout rod, won by L. H. Schortemeier, of New York city.
3. Webster collegiate dictionary, won by Abe Stacy, of Belchertown.
4. Multiplying reel, won by Lewis H. Bradley, of Bridgeport, Conn.

The best shooting was done by the following shooters, showing number targets shot at and broke, also per cent. for day's shooting:

	Shot at.	Broke.	Per Cent.		Shot at.	Broke.	Per Cent.
Barstow	200	165	82½	Highwood	200	146	73
Schorty	200	163	81½	Lovering	200	145	72½
Stacy	200	155	77½	Douglass	200	138	69
Bradley	200	153	76½	F E Metcalf	200	137	68½
McFetridge	200	152	76	H Metcalf	200	130	65
Mack	200	150	75	Kites	200	124	62
P H	200	147	73½				

The scores by events follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot	Broke.
Targets:	10	15	20	10	15	20	15	25	20	15	20	15	200	163
Schorty	8	12	15	10	12	16	12	17	17	14	16	14	200	160
Mack	8	13	15	10	8	15	8	21	16	8	14	14	200	146
Highwood	6	11	14	9	12	12	13	18	13	12	16	10	200	165
Barstow	7	10	16	7	12	16	12	21	16	14	10	13	200	153
Bradley	7	10	15	9	12	17	12	20	16	10	16	9	200	162
McFetridge	6	13	16	8	13	15	9	21	15	9	12	15	200	130
Hollister	6	10	14	10	12	13	11	15					200	145

C. L. KITES, Sec'y.

Riverside Gun Club.

UTICA, N. Y.—Mr. E. D. Fulford was high gun in the programme events of the Labor Day shoot, given by the Riverside Gun Club. Palmiter, of Sherburne, won second, and Messrs. Mayhew and Christian were tied for third. Several extra events were also shot.

Shooters were present from Syracuse, Baldwinsville, Waterville, Iton, Sherburne, Earlville, Norwich and Trenton. The weather was pleasant. The targets were thrown fast, and few straight scores were made.

The main contest was event No. 6, for a gold medal, emblematic of the championship of central New York. R. G. Wheeler, of Syracuse, won it, with 24 out of a possible 25. Fulford tied, but was not eligible to compete for the prizes.

The other winners of prizes were M. M. Mayhew, E. Loughlin, E. P. Clark, Mr. Palmiter, A. Christian and J. Wagner.

The tournament committee were F. Stephens, Charles Sabine, D. Loughlin, F. A. Kline and E. Loughlin.

The next regular shoot will occur on Sept. 18.

Following are the scores, each being an allowance handicap:

Events:	1	2	3	4	5	6	7	8
Targets:	10	15	15	15	10	25	10	15

Cleveland Tournament.

CLEVELAND, O., Sept. 7.—The Labor Day tournament of the Cleveland, O., Gun Club Company was well attended. The programme commenced at 9 o'clock sharp, and then began one of the most successful shoots ever held in that section.

The strong wind made the flight of the targets very erratic, and while the scores appear to be low, they were good when the conditions are taken into consideration. The scores are as follows:

Events:	1	2	3	4	5	6	7	8	9	10	Total.
Targets:	15	15	10	15	15	10	15	15	15	15	161

Du Bois Tournament.

Du Bois, Pa.—The Du Bois Rod and Gun Club held a successful tournament on Sept. 10 and 11. The weather was pleasant. The Hibner cup, for which there were only two entries, was won by the Du Bois team.

The programme of the day comprised a total of 180 targets. Nobles, of Olean, was the high gun, with 167 out of 180. Atkinson, of New Castle, scored 166; Burgoon 164, Beach 162, Kelly 158, Guinzburg 152, McCreight 148, Wolfe 144.

The scores follow:

Sept. 10, First Day.

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	1	2	3	4	5	6	7	8	9	10
Nobles	10	15	21	13	10	18	12	17	13	22
Brown	11	17	14	20	14	17	12	18	15	24

Hart	8	13	9	11	11	13	11	9	14	14
Hummelsb	10	11	11	14	13	17	7	15	15	21
Millen	10	11	11	14	13	17	7	15	15	21

Team shoot for cup:

Du Bois—Burgoon 21, Kelly 23, Miller 22, Guinzburg 22; total 88.
Kane—Nobles 24, Williams 14, Brown 22, Sizer 17; total 77.

Sept. 11, Second Day.

The second day was favored with a larger attendance. Kelly, of local renown, tied with the famous Atkinson, of New Castle, for the day's average. F. Guinzburg made a run of 50.

The Du Bois Club recovered the Iroquois cup by defeating Clearfield for it in a five-man team match, scoring 112 to 99 out of a possible 125. The scores of this event follow:

Du Bois—Burgoon 23, Guinzburg 23, Wolf 23, Kelly 24, Quinn 19; total, 112.

Kane—Nobles 24, Williams 17, Brown 17, Sizer 21, Nittrow 20; total 99.

Houck	14	10	13	12	11	11	11	11	11	11

The programme for the day provided a total of 180 targets, and the ten highest were: Kelly 168, Atkinson 168, Nobles 164, Beach 160, Guinzburg 158, Wolf 157, Brown 157, Sizer 154, Nittrow 153, Quinn 151.

Renovo Tournament.

Renovo, Pa., Sept. 9.—The first annual tournament of the Recreation Gun Club, of Renovo, Pa., was held Sept. 8-9. The club was unfortunate in drawing dates. It rained all the first day. The bad weather kept away many shooters who had expressed their intention to be present.

The club put up a very pretty silver cup, to be contested for by any team of five men, belonging to same club, in the State. The cup to be the absolute property of the winning team.

The Du Bois, Pa., Gun Club sent a team, and they were the only ones besides the home team that were game enough to go out in the rain and shoot. They won the cup from the Renovo team, the score being: Du Bois 104, Renovo 99. But in view of the fact that Du Bois team has cleaned up all the teams they have shot against this fall, it does not reflect any on the Renovo Club. This club is a new organization, and they hope by the time they hold their next tournament, to have a team that will hold their own against any of them.

Among the visitors present was Mr. Frank Lawrence, who attracted considerable attention with the new automatic rifle made by his company, giving a good exhibition of breaking flying targets with a rifle.

The second day the weather was not so bad, and a delegation of shooters from Jersey Shore, Pa., arrived and participated in the different events at live birds and targets. During the afternoon about 500 of the town people came out to see the shoot. The club has already commenced to arrange for a big shoot next year, and they hope to pick dates when it will not rain.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, SEPTEMBER 26, 1903.

VOL. LXI.—No. 13.
{ No. 846 BROADWAY, NEW YORK }

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

PROTECTIVE COLORATION.

PROTECTIVE coloration is a familiar subject, and one concerning which most of us have had some experience. We have all looked at—perhaps without seeing it—a bird crouched on the ground, a rabbit huddled in its form, a snipe standing motionless before a tuft of yellow grass. These things we do not see partly because we do not know just how to look for them, and partly because the creature looked at is so colored that it appears to be a portion of the landscape with which it blends. This protective coloration is analogous to protective mimicry, but is not the same thing. Examples of mimicry are seen in the so-called walking stick, which resembles the twig of a tree, in certain butterflies, whose colors closely resemble those of the flowers among which they feed, and in certain others which have dull colored linings to their wings which resemble the stones, earth, or bark on which they rest with folded wings. Some harmless snakes imitate the actions of their venomous relatives, rattling with the tail and assuming an aspect of great ferocity, while certain herons, when approached, hold themselves so erect and motionless that, with the streaking of their necks, they cannot be distinguished from the weeds or blades of the grass among which they are standing. In the same way a grouse, when startled and driven into a tree, stands motionless with feathers pressed close to its sides and head and neck stretched out, so that it looks much like a dead branch projecting from the limb on which it stands.

Many of us have known the location of a nest of quail, woodcock, or partridge, and on visiting the place to try to see the bird sitting on her eggs, have learned how difficult it is to detect her, even though the precise spot where she sits may be known. Once while riding along over the prairie at the edge of a little boggy place, an English snipe rose from the roadside, and flying twenty-five or thirty yards alighted apparently on the bare black mud at the foot of a little tuft of yellow grass. Until he closed his wings he was distinctly visible. Then he disappeared. As we rode on watching the tussock beneath which he stood, we saw a little projection from one side which grew constantly larger, and a moment later this projection took a step or two forward, and was recognized as the snipe and then stood still against the yellow down hanging grass of the tussock. As it ceased to move it became invisible.

If we look at a zebra in his paddock or a tiger in his cage, it seems to us that a more conspicuous coloring could hardly have been devised for an animal. Yet the tiger crouching in the grass or among the cane of the jungle harmonizes absolutely with its surroundings, the yellow stripes representing the stalks shone on by the sun, while the black stripes represent the shadows between those stalks. The testimony of African observers shows that in cover the zebra is invisible, and that he is also practically invisible at a distance on the open plain in broad daylight, and also at close quarters in the dusk and in the moonlight. It appears that the white stripes blend with the shafts of light sifting through the foliage and branches and reflected by the leaves of the trees, while in an uncertain light, or at a great distance, the black and the white, or the brown and the yellow—of other species—mutually counteract each other and form a uniform gray.

It is well known that most animals living wholly on the plains are colored more or less to conform to the surface of the ground where they are found. This is true of the elk, the antelope, the various deer and the mountain sheep of our own West, while the protection of white is seen in our mountain goat and in the ptarmigan which live among the snow.

The deer, the antelope and the sheep, together with many of the wild animals of other lands, are pale or white below; the object of this coloring being, according to Mr.

Thayer's law, to compensate for the shadows which the bodies cast, and to make the animal absolutely inconspicuous. It is worth while, in fact, to quote precisely what Mr. Thayer says about this law: "Mimicry makes an animal appear to be some other thing, whereas this newly discovered law makes him cease to appear to exist at all." Mr. Thayer calls this the law of gradation in the color of animals, and says of it animals are painted by nature darkest on those parts which tend to be most lighted by the sky's light, and vice versa. The result of this coloring is that the gradations of light and shade by which opaque solid objects manifest themselves to the eye are effaced at every point. Thus the markings on animals partake in appearance of the background against which the animal is seen. An enemy looking down on a ground-inhabiting bird from above finds it difficult to detect the bird, because its color matches so with the mottled ground about it. An enemy looking at the bird from the side, finds it equally difficult to detect it, because the mottled color, lightest below and grading to dark above, blends so closely with the vegetation against which the bird is seen and among which it walks.

Mr. Thayer's law is recognized as one of the most important contributions to the subject of protective coloration that has yet been made. Each reader, and above all each country dweller, should learn to observe these matters for himself. He will find that wide open eyes and the habit of recording what he sees in his note book, will add very greatly to his pleasure in life.

SOME STORIES OF THE DAY.

OUR correspondent who noted the yacht racing picture fake by the New York Journal, if he read the papers with an eye to such things, might readily catalogue a long list of kindred inventions and deceptions. For instance, the Bangor, Me., correspondent of the Boston Herald, under date of September 9, reported that W. K. Vanderbilt, Jr., and R. C. Watson, of New York, passed through Bangor on that day; and Mr. Vanderbilt was made to say: "We have just been on a hunting trip to Nova Scotia and we were very successful, getting a number of heads. We have sent them on to New York and will have them mounted. We had a fine time." As the hunting season in Nova Scotia was some weeks off, it is apparent that somebody was intent upon trifling with the Herald.

More grotesque than this was an achievement of the New York Herald the other day. Word having come over the wires that an automobile party from Paterson, N. J., had set out on a hunting tour in the Maine woods in the moose and deer country, the Herald artists on the spot (in Herald Square) pulled out from their fake photo files a photograph of a party of hunters posing for their portraits with a lot of huge elk horns. Now to the fakir on a great metropolitan daily all things that have horns look alike; moose, deer, elk or caribou, it is all one to him; if the game depicted happens to be a species unknown, so much more creditable is the fake. Accordingly the Herald artist put automobiling caps on the men in the picture, and under it inscribed the legend: "Spoils of James B. Dill's automobile hunting party. Mr. Dill stands at the right." Then the news-fake editor added the mendacious explanation of the picture:

James B. Dill, corporation lawyer and partner of John W. Griggs, former Attorney-General, with quite a party, that included Mr. Dill's two daughters, Winthrop E. Scarritt and John M. Schmidt, of East Orange, N. J., has just completed an automobile trip to the Rangeley Lakes. They are now on their way home.

On the long automobile trip there was abundant opportunity for shooting, and fishing. Several deer were shot by the tourists.

A photographer who was in the party photographed Mr. Dill and his friends at the conclusion of a particularly fine day's sport, as they stood surrounded by their game. Mr. Dill expects to bring the antlers of the deer home with him.

And the Herald reader paid three cents the next morning for the privilege of reading this picturesque Maine elk hunting story, and heaven only knows how much more pure unadulterated fiction in the other columns.

But the palm for large achievement in this line must be awarded to the London Times, which gravely reported one day last week that an American in Ireland had liberated a consignment of rattlesnakes, putting them out to determine whether they would multiply and stock the land in spite of St. Patrick. The story was cabled to the American press, and probably went around the world, never to be overtaken by the explanation, which followed

a day later, that the whole thing was a hoax perpetrated for the mocking of the Thunderer and the gaiety of nations. The story sounds like the picturesque tales which used to be sent over the country under a date line of Lander, Wyo., telling of packs of wild dogs running down mountain sheep and bringing the mutton home to their master, and of terrific combats between man and mountain lion ended by the man severing with his iron jaw the jugular of the lion. The Lander genius has been quiescent of late; can it be possible that he has emigrated to Ireland, and chosen for his medium the stupidly credulous London Times?

THE DISMAL SWAMP.

THE growth of a people multiplies their necessities, which in turn are the most persistent incentives to constant progress. The onward march in civilization is relentless and unceasing. Obstacles in its path are ruthlessly removed or destroyed, while all else of earth, air and water are laid under tribute by man to minister to his needs and pleasures.

In his capacity as an individual, man is more or less prone to sentiment and veneration, while in his capacity as a unit of society he is mercilessly iconoclastic. Society as a whole in its activities is actuated by the units of which it is composed. This is more in evidence in the great cities where the destruction or removal of venerated institutions is viewed with phlegmatic indifference. Historic grounds, sacred in their associations of the doings of war or peace, are applied to utilitarian purposes with no waste of words. Cemeteries are condemned, overhauled and restored to the uses of the living in the most matter of fact manner. A historic sentiment fares badly when it clashes with a present necessity. But the march of progress, which is a form of iconoclasm, is constantly taking wider form. Whole sections, chiefly associated with the sentimental, are in progress of appropriation to utilitarianism. The most recent is the Dismal Swamp, famous in the realm of myth, story, and song. In slavery days it was a famous and much used sanctuary for runaway slaves who were in a measure safe from capture when once well within its wild fastnesses. In its vast forests of cedar, cypress, and other trees, slaves and criminals were said to have lived securely for years. The negro mind, and, in a lesser degree, the white mind, peopled its gloomy depths with multitudinous and varied beings of the supernatural world. It was the hiding place of Mrs. Stowe's Dred. Tom Moore, that superlative man of rhyme and reason, deemed it worthy of his muse when he touched upon it in the "Tale of the Dismal Swamp" with its haunting verse:

They made her a grave too cold and damp
For a soul so warm and true;
And she's gone to the Lake of the Dismal Swamp,
Where all night long by a firefly lamp,
She paddles her white canoe.

And now the daily press reports have it that vandal man will drain this vast area of thirty miles by ten, and where once was the home of big game and small game will be the homes and workshops of man. Lake Drummond, the central body of water, will cease to exist. The great district so prolific in myth, legend and story, will be taken from the realm of imagination into the realm of the material every day world.

THE telegraphed statement that Senator Proctor had broken the New Hampshire game law may well have caused his friends and acquaintances to smile. These friends know that it would be hard to find a keener sportsman than Senator Proctor, a man more devoted to game protection and preservation, one with a higher sense of his responsibilities as citizen and United States Senator, or with a more scrupulous regard for the law. There are not many States in which the raccoon is a protected animal, and we fancy it would puzzle the average sportsman to say whether 'coons are or are not in season in September in any particular part of the country. Certainly in bygone years early autumn was the great 'coon hunting season all through New England. If, as reported, Senator Proctor killed a 'coon in violation of the New Hampshire statute for the protection of this ring-tailed inhabitant of the hollow, he is rather entitled to sympathy for having left his copy of the *Game Laws in Brief* at home.

The Sportsman Tourist.

Klamath and Crater Lakes.—II.

FORTY-SIX miles north of the Poplars lies Crater Lake. The sunken summit of its mountain being plainly in view. All who had been there were enthusiastic in their praises of this Oregon wonder, and we decided to visit it. But our idle life on a rich trout diet for the last two weeks had rendered us fat and lazy; we did not relish a pedestrian trip, and started an investigation for saddle horses. Most of the best animals were engaged in cutting, raking and hauling hay; but Griffith soon hustled up a couple of genuine cayuse ponies. They could not be called beautiful from an artistic point of view, and I could not help thinking of Mark Twain's description of the wild steeds of the desert in "Innocents Abroad," but they proved to be better than they looked, and carried us there and back in a very satisfactory manner. When I mounted mine of a morning under a cold saddle; he had a habit of extending his forefeet and sinking down until his body nearly or quite touched the ground. This rather alarming peculiarity so suggestive of a fractured spinal column gave me some concern at first, but as it was never repeated on the same day, I decided it was the result of early training.

Our route for ten miles lay through the fir and tamarack, with occasional glimpses on our right of the great marsh through which winds Crystal creek, the lake itself being nearly three miles away. Leaving this, we crossed a beautifully clear stream called Seven Mile creek, running bank full and well stocked with trout. We now entered a large valley with many hay fields of several hundred acres under one fence, where mowers were running in every direction. Horse flies were very numerous, and all the working animals were covered from nose to tail with nets or sacking.

An hour's ride brought us to Fort Klamath, a little settlement several miles away from the old fort itself, and the supply point for this great valley. This is the nearest point to the Poplars, having daily stage connection with the railroad. We stopped here long enough to get a few groceries and then rode several miles farther and encamped in a cotton wood grove on the bank of a small stream, twenty-six miles from the Poplars. Thirty years before I had often ridden all day and all the ensuing night in a Texas stampede without being extremely fatigued, but I must confess that I was in a worse condition after my first day's ride to Crater Lake than I was after the thirty-mile walk the evening I camped at Rock creek.

Klamath is fairly well timbered, although the general quality is inferior to that nearer the coast; but the wanton destruction by lumbermen was even more glaring than I had found elsewhere. Hundreds of trees had been felled, and for some unknown reason left to rot; making, as fuel for forest fires, a constant menace to what remained. This was strikingly illustrated along our route the next day where a late forest fire had left scarcely a living thing behind it for many miles.

The altitude rapidly increased as we approached our destination that afternoon, going along the banks of the Anna, whose swift waters had cut their way a thousand feet deep through perpendicular cliffs of solid rock, which, in places, made it a miniature Yosemite. When within about six miles of the lake, our horses were attacked by a large and very vicious fly, whose bite drew blood instantly. They were so numerous and bold that several times I killed three or four with a single slap of the hand on the shoulder of my horse; and we passed a white mare picketed, the bare side of whose neck was bathed in blood. The Government has wisely set aside a large tract surrounding the lake as a reservation, and the superintendent, with a gang of men, was building a bridge across the Anna and laying out a shorter route, cutting off about two miles in the last five by the old route. The park regulations, which were posted upon trees in many places, could elicit nothing but the warmest commendation from all law abiding men. They had been framed with the sole view of giving all every possible indulgence that did not threaten injury to this great scenic attraction, as rob future visitors of some of its charms. The superintendent was a thorough gentleman, as we found all those to be in our southern outing last year, and none but evil-doers will experience anything but the most courteous treatment. I never before in visiting these parks realized how anxious the Government was to give the people every enjoyment that these great reserves could furnish.

When about a mile from the summit we passed the tents of several parties encamped at the last running water. The snow falls here several feet deep in winter, and large drifts of it now began to appear in the deeply shaded spots so solidly packed that our horses' feet made but little impression upon it. As we neared the rim of the crater we left the forest, and when we rode to the crest of a ridge of volcanic sand, Oregon's greatest wonder in all its wild, weird grandeur lay within one cast of vision, revealed to our view.

Imagine a mountain that may have been as large as Shasta with the upper two-thirds blown entirely away by some tremendous internal force and the remaining base disemboweled to an unknown depth until it resembled a gigantic mush bowl, rather longer from east to west than from north to south, with an area of five by seven miles, but so deceptive because of the purity of both air and water that it does not look one-quarter as large; partially fill this great cavity with water so pure that Tahoe, which has always been considered the standard in that respect, must take second place; put near the western end a lone cone-shaped island 800 feet high, sparsely covered with firs—and you will have some idea of what we saw at the first glance.

The water, which is a most beautiful shade of blue, has been sounded by the Government surveyors to the depth of 2,600 feet without finding bottom, and its surface was 2,000 feet below the point upon which we

were standing. This was about the average height of the rim, which was quite uniform, very few spots were any less, but at two or three points high and almost perpendicular bluffs of solid rock rose to 3,000 and even 3,500 feet. Facing any point of the crater from where we stood, nothing else was in sight except to the northwest, where a singular finger-like peak of rock about twenty miles distant rose nearly 2,000 feet higher.

The sides of the crater were, for the most part, too steep for vegetable growth; but in places a few scrubby trees were clinging to its sides, and in others snow drifts extended to the water's edge. There are two places where the water can be reached by going down rifts or waterways, and a boat that made trips to the island was in use in former years, but we saw nothing of it during our stay. To reach the island from this shore requires half an hour's pull by a good oarsman, although from appearance five minutes would be a liberal estimate. It looked about a good gunshot away, but a rifle ball fired at it struck the water less than half the distance. In the top of the island is a small crater 300 feet wide by 100 deep, its sides composed of ashes, cinders and volcanic scoria, having an angle of about 45 degrees. It has no water in it, and is evidently the result of the last expiring throes of the great convulsion that left this section in its present condition.

No living thing of fin, fur or feather ruffled the glass-like surface of the water; no song birds caroled upon its banks or winged their way from shore to shore. I looked for the little water angel so common elsewhere, thinking that he at least for such water as this would ignore any surroundings, however uncanny; but I looked in vain. The silence was that of the desert. The probable cause of this was not far to

sprung into view; but the coming of the white man may have exorcised the spirits of darkness, for nothing of the kind occurred. Over our heads the moon, now in her first quarter, gradually replaced with her uncertain radiance the light of the departing day; but still we lingered, finding it difficult to leave a spot that aroused emotion so foreign to those engendered in the more prosaic walks of life.

Before leaving the Poplars, we had been warned of the insect pests of Crater Lake. The horse flies, we had already discovered, came fully up to the description. The mosquitoes were represented to be of a brand superior to any that could be found elsewhere. Unaffected by any temperature above zero, they were said to be so persistent that the ordinary safeguards were of no avail, and their bite was so venomous that it resulted in something very much like a carbuncle boil. Now, as the Poplars had an article of its own of that kind, which had commanded our most profound respect, a warning from such a source was not to be disregarded; and we had provided ourselves with bars of double thickness and elaborate construction, which we felt would be equal to any emergency. But no mosquitoes came near us, as we sat upon the bluff in the gloaming, where we could take in the whole weird landscape; for they, too, like all other living beings, except ourselves, seemed to shun a locality whose surroundings constantly reminded one of the unhallowed abode of goblins and satyrs.

On our right the sickly rays of the half-grown moon threw the uncertain outlines of the overhanging cliffs far out into the liquid depths below. On the left lay the island, whose somber summit darkened all that end of the lake. On the opposite side long, narrow banks of snow, like groups of shrouded ghosts, stooped to the

A BIT OF LINKVILLE, DESCRIBED BY FORKED DEER IN HIS FIRST PAPER.

seek. Its great depth and ice cold waters precluded the growth of either aquatic vegetable or insect life; there was no food there. Some enthusiastic sportsmen two years before had at great trouble and some expense placed some trout there, but they were never seen nor heard of afterward; pumice stone, lava, ashes and scoria were too much for their delicate stomachs, and there was little else.*

The sun was now fast sinking in the west; neither the horses or their riders had eaten anything since early morning, and reluctantly we withdrew from the strangely fascinating spectacle into the edge of the timber, where we made our camp for the night after putting trail ropes to our horses and turning them loose to enable them to fight the savage flies to better advantage.

The dearth of water at this elevation was not a serious condition; the grass was green and succulent, and for our cuisine we went to the neighboring snow banks. As soon as we had cleared away the supper dishes and arranged the blankets for night we hurried back to the lake. For all who visit it there is a strange attraction in that mysterious sheet of water and its unique environment that is as strange as it is inexplicable. To the primitive and superstitious redmen, who for ages had dwelt beneath its shadow, it was the abode of an evil spirit, which at dark arose to the surface ready to destroy the unlucky mortal who had the temerity to linger upon its shores; and to-day they speak of it with awe, and none can be persuaded to tarry there after nightfall.

It was after sunset when we seated ourselves on a prominent point that commanded a view of every portion of the lake. The walls of the crater were falling into the shadow and the water had changed to an indigo color. No sound came from its depths. Dark, motionless and awe inspiring it lay far below the side of the "House of Usher."

The hoot of an owl, the croak of a raven, would have been a welcome sound, but even these birds of evil omen shunned the sinister shores. Something like this I fancy may exist on the verdureless mountains of our satellite, but it did not seem quite to belong to our own planet. We would hardly have been surprised had the waters parted and the friend of Indian imagery

water's edge; and away beyond them all arose the silhouette of that strange finger-like peak, an isolated but harmonious landmark in a region exactly suited for the brewing of the witches of Macbeth or the incantations of Herzog.

As we entered the timber on our return to camp, the Crater Lake brand of mosquitoes met us in force. To use a western expression, they were there with both feet; and from their enthusiastic reception we inferred that nothing quite so satisfying as we were had come that way for some time. In vain did we try to rout them with a smudge. Clouds of smoke that nearly suffocated us were to them as the spicy gales of "Araby the Blest," only the double netting saved us from extermination or an ignominious retreat; and beneath its sheltering folds we sank calmly into slumber, with a hum about us like that from a swarm of enraged bees. When we awoke the next morning, we found that some of the more enterprising ones had succeeded in getting through one thickness, but had then become entangled and had miserably perished. In the vast marshes that surround Klamath Lake, we could easily account for their abundance there; but where they came from on this steep mountain side was a mystery we could not solve. It is certain that they did not breed in the icy waters of the lake. There were no stagnant pools or in fact water of any kind in quantities very near, and we finally decided that they must be of the Alaska variety that breed in the snow drifts.

Fifteen miles north of Crater Lake is one of the most extraordinary huckleberry patches in the world. It is situated in a very wild and rugged section on the crest of a spur of the Cascades, and is fifteen miles long by about three in width. In quality and size, some being as large as hazelnuts, the berries are exceptionally fine and so plentiful are they that it is nothing uncommon for one person to gather thirty or forty gallons during a week's stay. During the berry season the ranchers visit it in large numbers, some coming from more than 100 miles away; making a festival of it similar to the shore parties of the Atlantic seaboard.

Our return trip to the Poplars was rather barren of incidents of special interest. Game was not plenty, we saw no deer and but little sign; we found a few grouse and saw two of the California gray tree squirrels, which are larger and finer than their congeners in the East. While these are scattered about through all the

[*Possibly Lewis' woodpecker (*Melanerpes torquatus* (Wilson)).—Ed.]

Chased by Indians.

ALL through the summer of 1867 I was stationed at old Fort Chadbourne. That is, the troop was there; I was for the most part of the time somewhere else, carrying mail or dispatches. I was kept on the road almost constantly, partly because the captain wanted me to do this work; he had an idea that I would not get lost, and I wanted to do it myself. I could combine the dispatch carrying with hunting, but this time I was the hunted. Fort Chadbourne was an old post built years before the war on Oak Creek, in what is now Runnels county, Texas. It had been abandoned years before; there was not enough water here, but we had reoccupied it this summer because there was no other place suitable in this part of the country. It was away out on the frontier then, the nearest settlement being at Fort Mason, now the town of Mason, eighty miles east.

There had been a string of posts running north and south clear from the Rio Grande up to the Indian Territory, but most of them had been, like this one, abandoned ever since 1861.

The next nearest camp to the north of us was on the Clear Fork of the Brazos, where Fort Griffen was afterwards built. It was about eighty miles from Chadbourne, and a troop of the Sixth Cavalry (Chaffee's troop, I think it was; he was a captain in the Sixth then; he is a general now) was in camp here, but he was not with it.

I was sent one morning about the last of August with a dispatch to this camp from the commanding officer at Chadbourne; he was the captain of my troop. He told me that I might take three days to go in, as there was no hurry, then asked if I wanted company. But I preferred to go alone. I meant to go through in two days, for if I took three, the first place I would have to camp at would be too near the trail the Indians took in their raids down the country. They were Comanches who hung out west of this on the edge of the Staked Plains, and were going and coming all the time. I knew just where to keep a lookout so as not to meet them, and meant to do it, too.

The first thirty miles of the trail from Chadbourne led across a wide bottom that was thickly overgrown with mesquite bushes. Then after crossing a creek it led through Mountain Pass. This was a narrow, steep pass between high mountains, the floor of the pass being covered with large trees that stood close together, and the walls on each side were too steep in most places to admit of a horse being taken up or down them. The pass was about three miles in length and ran north and south; it was a good place in there to find black bear; I found them there more than once. At the lower or northern end of it is the highest mountain in the group, and this Indian trail passed close to it, the trail running east and west. Just here a man out of my troop had been killed only a month before this. He had straggled back from the party he was with, and the Indians had either not seen his party, or, what was more likely, had been afraid to attack it, but had killed and scalped him. I afterwards put up a stone at his grave; it is most likely there yet; his name was Daniel Worm.

This would be where I should camp to make a three days' trip of it. I did not, though, but keeping on went into camp at Phantom Hill, twenty-five miles further on; then went on to my destination next day. When I had given the lieutenant who was in command his mail and dispatches, he told me that he wanted me to remain a day so as to give him and his men time to write their letters, which I could take back with me and have them sent from our post down to Mason, that being the nearest post-office.

The next day happened to be Sunday, but there is no Sunday in the army. They play ball on that day now; it had not been introduced into the army then, or else those of us who had been born in the United States could have played it. I had learned to play it soon after being weaned. After the troop had been inspected, I put in most of the day helping some of the men study the history of the Four Kings in connection with a game of 10-cent ante, and I left them the following morning with some of their loose change in my pocket.

I started late next morning, carrying the mail on the cantle of my saddle, with my horse's nose bag full of cooked rations; these came in handy later on when the Indians had me corraled in the pass. I meant to camp again at Phantom Hill, then go on through the pass and camp that night at the creek just beyond it. I camped at Phantom Hill all right, but made no camp on the creek; the Indians changed my plans.

I had got to where the Indian trail crossed mine at the foot of the mountains, on the second day, and just as I did so I gave a look to the east, or down the country, and saw a party of four Indians come riding slowly up the trail toward me, while half a mile behind them more Indians were driving along a bunch of cattle. They had been down the country after cattle or horses—either would do. The Indians saw me about the same time that I saw them, and now began to lash their ponies; here was another scalp, they thought.

"You can go to heaven," I thought. "You are just two minutes too late for this scalp. I need this one myself."

Then giving my horse the reins I went on a dead run up to the real entrance to the pass, a mile away. The mountains only closed it on the left here; there was an open country on the right for the next mile; but there was no danger of the Indians cutting me off; I had a horse that could go two miles to their one and not half try. "Once I get into that pass," I thought, "I can stand them off. It may be a case of starve me out, though, but I can hold the pass all right." I had a Spencer carbine and 100 rounds for it, a Colt's powder and ball pistol and about 50 rounds for it, and would not be fool enough to fire a shot before they had got in close enough to be hit.

The next thing I did was rather foolish, though. I was ashamed of it afterwards. I had often seen our men during the war of the Rebellion, when just about to form a line of battle, take any cards they had about them and throw them away. I never carried them then, but would tell the men that they were foolish; that there was no more danger of their being shot with cards than without them. I had a new deck of cards in my breast pocket, and taking them out I quickly dropped them on the trail.

"I may get shot by those fellows," I thought, "and if I do, I don't want Saint Peter, when I apply at his gate without a pass, to go through my pockets and find a deck of cards." I heard from these cards afterwards, though; but they were the last cards I ever threw away when going into an Indian fight.

I was at the mouth of the pass now, and pulling up my horse I turned and looked back for the first time since starting. The four Indians who had taken after me were still following, but were half a mile away. Taking off my hat I swung it; then turning my horse again, rode on into the pass and up it about 300 yards to where the floor was wider and there was good grass in among the trees.

I ran my horse in here, then jumping off got the lariat off the saddle; one end of it was already about the horse's neck, I threw the other end around a tree, then dragging my carbine out of its boot on the saddle, I sprang the lever and jumped out into the trail; then got behind a tree. No Indian could get in here without me getting a fair shot at him, and they could not climb the mountain and flank me here. They might cross the mountains to the west of this, then come in behind me; but that would involve a march of twenty miles. "They won't do that," I thought; though it was just what I would have done in their place.

I pulled out my watch and looked at the time; it was half past 3 o'clock. "In three hours now," I thought, "it will be too dark in here for them. If they don't call before then I need not expect them before morning." I had an idea then that no Indian would make a night attack. I since found that these Comanches would; but few other tribes would. The Apache was a coward at night; he was one in the daytime though.

I stood behind this tree until it had got to be so dark that I could not see down the trail; then going to my horse I moved him on fresh grass, tying him out properly, for I was not in so much of a hurry now. Then coming back I lay down on one side of the trail where I could sweep it if anyone came up. In about an hour I saw something coming toward me on the trail. It was so dark now that only by lying close to the ground could I see it move; but I knew it was not a man nor a horse. When they had got closer I saw that they were coyotes. There were half a dozen of them and they were moving up the trail carelessly, bound, no doubt, to the creek after water. "There are no Indians where you came from," I thought, "or you would not be so slow about getting through here." I gave a low whistle and the coyotes all stopped and looked toward where I lay. "Git!" I told them, rising to my feet, and they ran off back the way they had come. I lay a while longer, looking up at what stars I could see every once in a while, to see how fast the night was passing; I did not want to strike a light to look at my watch.

At last when I thought that it must be near midnight, I took my hat off, held my watch inside of it and struck a match; it was just 11 o'clock.

I began to study now what I had better do. I should not have stopped in the pass at all had I known as much as I did now; but I had expected the Indians to follow me in. Why they did not, puzzled me; and if I started now part of them might have crossed the mountains to meet me on the far side, while the rest had been left at the mouth of the pass. "I'll stay here now until daylight," I told myself, "then I can see where I am going." And while still thinking this over I dropped off fast asleep and never wakened up until six o'clock the next morning. Then I wakened with a start and jumped up, and running out to my horse found him lying down fast asleep also; but he got up and came to meet me.

Next going out to the trail I looked at it closely. No one had been through here, my trail and those of the coyotes were plain enough, but no other marks.

I put my saddle on; while I was doing it the horse kept rubbing his nose against me; and putting my arm around his neck I said, "They did not get us, did they? And they won't, neither, before they raise a new breed of horses. A pony has no business following you, has he?"

I led the horse out to the trail, and mounting, sat here studying. I was in doubt which way to go now. I wanted to go back down the trail and try to find out if the Indians were still there; why they had not come here still kept me thinking.

"No," I said at last, "I was not sent to hunt Indians, but to carry the mail. I'll get into the post as soon as I can; then let a troop hunt them."

I went through the pass at a trot, and when I had got to the creek beyond it, my friends the coyotes were here before me. "That settles it," I thought, "there are no Indians here, anyhow." Now taking up the gallop I kept it up and got into Chadbourne at 10 o'clock, handed the captain his dispatch and gave the proprietor the mail to take to the adjutant's office.

"Where did you camp last night?" the captain asked. "In the pass, sir. The Indians drove me into it yesterday afternoon." Then I told him all about it.

"Orderly," he said, "go and tell Major Callahan with my compliments that I wish to see him right away."

I could hardly keep my face straight. Callahan was our lieutenant; the troop would have to hunt Indians now; they might not get them, but I would get a cussing when the troop had got back for reporting these Indians.

"Shall I take another horse and go along, sir?" I asked.

"No, you stay here, you have had your share of them. Let the troop have them now."

The troop was out four days, but brought back no Indians. When it had got back I went to the first sergeant, a good fellow he was, too, and asked if they had found my Indians.

"No, of course not, they are out on the Staked Plains now. If you want them, why did you not keep them when you had them? We only found their trail."

"That let's me out, then; if they left the trail they must have been there to make one."

"Oh! they were there all right; you don't get stampeded at a buffalo, the major says; but they did not wait for us. See here," he asked, "would it be possible for you to go 500 yards from the post and not find us Indians?"

timbered portions of the State, they are nowhere very plenty, and so shy that parties frequently travel far in the forest without seeing one. We camped that night by the fair waters of Seven Mile creek, reaching the Poplars early in the afternoon of the next day, where for a few days we resumed our old routine of fishing a few hours in the morning and lounging about camp the remainder of the day. The lagoon leading up to the Poplars has one other feature worthy of mention. As before stated it is formed solely by springs, has no perceptible current and its waters are very cold, but while in winter the great lake freezes all over with the ice over a foot thick, the lagoon never freezes, and it is quite possible to row a boat to the mouth and step out on to the ice of the lake.

Considerable game can be found in the vicinity of the Poplars. Personally, I saw no deer; but their fresh tracks were seen nearly every morning within a short distance of the corrals, and they occasionally came into the pasture. Several were seen by the other campers, and two or three were shot at during our stay, but being in each instance on the jump when fired at, none were killed. A few miles to the north, on Cherry creek, we were told, there is an extensive salt lick, and a hunter reported that he had seen forty-two in that vicinity in one day, all of which, however, were does, with not a buck among them, most of the bucks probably being back on the high peaks drying their horns, which were still in the velvet. Blue and ruffed grouse were plenty and even a few Mongolian pheasants have found their way down there from the north, while duck and goose shooting in season are unsurpassed.

"Varmints" of various kinds were abundant; several black bears frequented a mountain about six miles away, coon and fox tracks were seen every day; and almost every night we were lulled into slumber by the yelping of coyotes. These serenaders, however, were quite expensive to the Griffiths, who, having started with twenty turkeys in the spring, had but three left at the time of our departure, the rest having fallen victims to these sneaking nuisances.

The trip back to Ager was a very leisurely one. We hunted and fished by the wayside the first day, making only eight miles to Rock creek, where I had made my lone camp on the way out. We spent one day at the summit, one of the most attractive points on the route from a scenic and sporting point of view; and the next day went only five miles in order to enjoy another evening with the old pioneer ways. The charms of the hot springs and hotel at Shovel creek made another delay, and the last night was spent at the splendid ranch of Mr. Woolmincamps, eight miles from the railroad.

This thrifty old German, who had lived there for eighteen years, had grown rich feeding the teams and entertaining the freighters between Ager, Klamath Falls and other points east of the railroad. He had the finest house and ranch on the route, and everything about the place was in the most up-to-date condition. A fine stream, called Boger's Creek, well stocked with trout, ran through the place, but for domestic and sanitary purposes he had run an underground two-inch pipe from a spring high up in a hill two miles away, giving him an abundance of the purest water for stock, the sink and sewer, besides power enough to grind his mower blades and ranch tools generally. As with most of the ranches on this road, hay was the great staple, the yield being largely increased by irrigation; but here we found a small vegetable garden and two orchards of apple, prune and plum, some of the trees so heavily laden that almost every large limb was propped. In the cool of the evening Mr. W. took us down into these orchards and we found the flavor of the fruit, especially the apples, far superior to those raised in the Sacramento Valley.

Noticing that many of the apples had large holes eaten into them, I inquired the cause, and Mr. W. said that soon after the fruit was half grown flocks of what were locally known as "apple birds" began to arrive from the south, and ravaged the orchards until the apples were all gathered, when they as suddenly disappeared, and not one would be seen until the next year. My curiosity was instantly aroused. I had never heard of them nor their depredations before, and up to that time had always believed that the apple was a fruit no feathered plunderers ever meddled with. Some years the birds are so numerous that they get most of the crop in spite of the constant warfare kept up by the ranchers. In this orchard I should say that fifty bushels or about one-quarter of the crop had been rendered unmarketable by them this year.

Wishing to investigate this, and learning that most of the damage was done in the morning, I rose early and went to the orchard. Before I got there I saw numbers of the birds flying about the trees and became satisfied that they were a species of woodpeckers entirely new to me. The way they lit upon the side of the posts indicated this, and subsequent examination confirmed it. Leaning against one of the trees was a fine shotgun, showing that the rancher was not submitting to his losses without a protest; and picking it up I started in pursuit. None of the pickers had yet arrived, but the birds were wild from constant harassing, and I had some difficulty in getting within range. One was finally secured, however, and I will briefly describe it. It was the size of a robin, the back and wings perfectly black; from the head down the throat and body to the tail ran a band of a light brick color about an inch wide, and a faint circle of similar feathers was around the eyes. Perhaps the editor of FOREST AND STREAM can give us some information about this bird, which I consider the worst pest in the section where it operates that the fruit raisers upon this coast have to contend with. I learned that it also destroys a great deal of green corn, husking the ears with its strong beak and eating the corn from the cob.

The next day before noon we reached Ager, where we disposed of our pack saddle, kiacks and surplus provisions at cost price to parties who were fitting out for the mountains, and at 4 o'clock P. M. of the same day boarded the train for San Francisco.

FORKED DEER.

"Yes, if there were none there to find, it would. When I do find them the Government pays me \$20 a month to let you know about it. I found those and they came mighty near finding me."

"There is another thing that I want to ask you," he said, "do those Indians of yours play cards?"

"I don't know, I did not stop there long enough to ask them. That may be what they wanted me for. I thought it was my scalp they wanted."

"Well, we found a full deck of cards just where your Indians jumped you, and the major thought maybe you had been trying to teach them poker."

"No, I lost them out of my saddle pocket and did not have time just then to pick them up. If those Indians need any points on poker let them call on the first sergeant of that troop down on the Clear Fork; he can give them a few. He put all the money he had on three sixes in a game we had down there last Monday. I took it down on three queens that I happened to have. He has less money just now, but he knows more about draw poker. Let him give them points."

I kept trying to think why those Indians did not follow me into the pass, and concluded that they must have suspected a trap. There might be a big party in there just waiting for them to charge into a hornets' nest. It is true that the party had not come up the road the way I had; but there was nothing to prevent them from coming down it, then stopping there while they sent me down as a bait; and these Indians were several removes from being fools; they knew that pass as well as I did and knew if they had to get out of it in a hurry most of them would stop there. Years after this I referred this question to an old chief, not telling him my opinion of it, and he told me that this was why they had let me go.

CABIA BLANCO.

Natural History.

A Trio of Gray Foxes.

Editor Forest and Stream:

IN FOREST AND STREAM OF June 6 (Vol. LX., p. 444), there was published an account of some small animals which we dug from a burrow near Beaverbrook Farm, at Milford, Connecticut. These animals were brownish black in color, about the size and shape of new born kittens, blind, and at the time they were discovered were apparently only a few hours old. They were put to nurse with a cat who had just given birth to three kittens, and at the time were doing well. No one who had seen them had any clear idea as to what they were, and readers of FOREST AND STREAM were asked for suggestions on the point.

Such suggestions as were received, by letters coming from readers in several States, were not very helpful, being mere guesses; for no one of the correspondents appeared ever to have seen any animal just like these.

Just one week after the animals were secured they began to open their eyes, and on the day following all three had their eyes open. By this time the little touches of brown or fulvous, which from the beginning had been noticed behind the ears, began to spread. Moreover, the hair, which at first had been short, smooth, and polished, began to grow longer and to look more woolly, and this was noticed especially first behind the ears and then on the back of the tail.

Soon after their eyes were open the little rascals began to crawl about and to learn to eat bread and milk with great relish, trying to get into the dish in which the food was, and often standing with all four feet in it while they lapped the fluid.

Soon after they had opened their eyes their teeth began to show, and as soon as these became visible, all idea of their being rodents was dropped, as the teeth showed them to be carnivora; and now the choice of names for them seemed to lie between the raccoon and the gray fox, with the probabilities seemingly to be in favor of the raccoon, because the youngsters showed a great disposition to use their feet in climbing.

As they grew larger they became very much more active, the coat grew longer, and the color began to

AT ABOUT SIX WEEKS.

change from a dull black to a dull gray, but still there was nothing by which their species could certainly be determined. Little by little they became more and more lively. Playing and fighting were almost incessant, and they spent much time scrambling about as fast as their little legs could carry them.

The young animals were a source of enormous pride and joy to their foster mother. She seemed to like nothing better than to sit and watch them by the hour, and at first she feared danger for them and was very uneasy when visitors came to look at them. If she took pleasure in them in this way, however, she paid a price for it; for the little villains often insisted on playing with her,

and biting her ears and tail; and their needle-like teeth must have hurt, for in these games the mother sometimes used to howl with pain.

One day a red squirrel—detected as he emerged from a corn crib—was shot, brought to the stable and thrown in to the puppies. Then there was fun. Each one wanted it, and while two were fighting for it the third carried off the prize, only to be attacked a moment later by the others. The struggle continued for some time, till at length the female beat off the others and for a long time chewed up the game unmolested. Now, too, from time to time, the mother cat brought a mouse to them, and over each one of these was fought a battle similar to the one with the squirrel, and all of these were most interesting to watch.

Their fights were often very fierce, and their anger seemed extreme. On more than one occasion blood was drawn, and the worrying sounds and nasal growlings which they uttered gave an impression of great fury. More than once it was feared that one of the fighters would be seriously hurt, and several times we were on the point of interfering to prevent injury to one or the other.

Not very long after this, the little savages were taken from the stall in the stable where they had been confined since capture, and put in a kind of pen about ten feet square. This pen has a cement floor, and on three sides is inclosed by wire netting six feet high, while the fourth is the side of a woodshed. In the wall of the woodhouse a hole had been cut and a kennel built inside the house, and here the foster mother and her children could retreat when it rained, and here they were shut up at night.

The change of location, which gave them sun and air and more room for exercise, was beneficial to the little beasts. They improved greatly and grew "like weeds." Such lively little chaps were never seen. They would run at the wire and half way up the side, and hang there and look out at the passers by. Sometimes they would scamper round the cage in circles, running as fast as they could. At first they were more or less slow and clumsy, but as they grew older they became more agile, jumping over whatever came in the way, and showing a swiftness and a lightness that seemed extraordinary.

Little by little, hair by hair, the baby coats changed to the adult fur, and this change was closely watched, since

THREE MONTHS OLD.

from it only could be determined what they were—coons or foxes.

The ends of the hairs on the body became white, the brown became more pronounced on the ears and feet, but so slowly did the change come that no one could be sure about their species. Finally, however, a black streak began to show along the top of their tails, and as this thickened and widened, so strengthened the hope and confidence of those who had declared them to be foxes, for who ever saw a 'coon with a black streak running along the top of his tail?

As tame gray foxes (*Urocyon cinereo-argentatus*) they were held as wonders in Connecticut, and many people wrote to ask about them and came to see them, and their health and physical strength impressed all their visitors. We made great friends with the two dogs, but the bitch was timid and cross. One of the dogs was particularly tame; he would run up the arm and crawl about one's shoulders, and even perched on top of a head a few times until the cap slid off the wearer's head and the fox fell to earth rather suddenly.

One night a great event happened to the tamest one. They had now grown quite large and the nights were warm, so that they were not locked up, but were given the freedom of the yard all night. One morning when the man came out to feed them, lo and behold there were only two foxes! Where was the third? A search was begun, but revealed nothing until someone went into the shed against which their pen was built to get some coal, when what should he see but a terribly scared and hungry fox puppy sitting in the coal bin, thinking he was lost to the world. Once back, he was not to have another chance to get out, for a wire top was also put on the pen, and his journeys of exploration came to an inglorious end.

He was not, however, deprived of amusement, for some golf balls were given him to play with, and, what was the greatest fun of all, they were introduced to the kittens.

The kittens now became the greatest friends the foxes had. They were constantly put in the cage, and played with the foxes for hours. The foxes gently chewed the kitten's ears and tail, and when they got too rough the

kitten quickly stopped them by a slap in the face. When a kitten had not been in the pen for a couple of hours and the foxes saw one walking around near the cage, they made a great fuss, whining and yelping and scratching on the wire until someone put the little cat inside, when all three foxes fell upon it and smelt it all over and chewed its ears. They used to roll over the kitten and

AT ABOUT TEN WEEKS.

squeal in a way that was very funny, and the kitten would think itself the most popular thing around.

Sometimes the kittens from without climbed up on the wire which roofed in the pen, and walked about on it. When they did this, the foxes became much excited, and clambering up the wire tried to reach the kittens, smelling at them and striving to bite and play with them.

A large branch of a tree, trimmed down, was put in the cage for the foxes to climb on, and on and about this they certainly had great sport, especially with the kitten. The kitten climbed up on the branch and the fox lay on his back beneath it; then the kitten would hit at the fox with its paw and the fox would bite at the kitten.

One day a young chicken wandering about looking for flies, saw one on the wire of the foxes' cage; the fox seeing the chicken coming advanced to meet it and stuck his nose close to the wire. The chicken pecked at the fly, and missing it hit the fox a sharp blow on the nose, and the fox gave a quick jump, quite taken aback at such forward and rude manners.

One day the man who feeds them, knowing the tastes of foxes, carried a live mouse by the tail into the cage, and after letting them smell it, released it. He afterward said that no cat could have killed it quicker than they did.

When some one whom they knew approached the pen, the two dogs usually ran to the wire wagging the tail and putting back the ears. When the kittens were put in the pen, the foxes commonly whined with pleasure or excitement.

They were always ready to play with the end of a rope or with a handkerchief, much as a kitten plays with a string; watching the end of the rope as it was drawn away from them, and then with two or three quick leaps overtaking and pouncing on it, pulling back and shaking the string, trying to drag it away, and if succeeding, retreating with it to the house, where it was played with for some time.

When admitted to an adjoining pen, which was not roofed over by wire netting, and in which the fine meshed wire did not reach to the top of the pen, they often ran up the netting and when they reached the top of the fine netting, clung there, thrusting their heads through the wider openings and looking about.

If a quick motion was made by anyone standing near the pen the foxes would often drop flat to the ground as if for concealment. This motion was extremely rapid.

The foxes like sweet chocolate and sweet things generally, and even the little bitch would come close to one when chocolate was offered to the dogs.

The door that leads from the cage into their house or kennel is hinged at the top, and therefore it swings outward and upward and can be fastened at any angle. One day this was fastened up at right angles to the wall, and the first thing the foxes did was to climb up on to it. Now whenever we go to see the foxes a mass of gray fur is usually visible quietly sleeping in the last place in the world that a wild fox would choose for his slumbers.

They are still as active and well as ever, and as playful and as tame. If one goes to the cage and puts the finger through the meshes, a fox will come up, smell the finger, and then, taking it in his mouth, will bite on it very gently. Sometimes still, they run three or four feet up the wire netting and hang there, and in this position seem to like to have the belly scratched.

F. L. G. AND R. PAGE.

Man and the Brute.

Editor Forest and Stream:

Your old-time correspondent, Hermit, in a recent issue of your treasured paper, arraigns me before the tribunal of your readers as a seeming offender against reason and common sense, and I therefore plead for a hearing in my defense. He characterizes as "impossible science" my assertion that "the boxer has no time to think, and, like the animal, depends upon the operation of habit," and further adds that it seems to him impossible to put more error in the same number of words. I apprehend that, in this instance, his impulse has outrun his judgment and hastened him into sweeping generalizations that he cannot sustain. Regretting, however, my compulsion to elaborate what appears to me and, not unlikely, to most of your intelligent readers, to be a self-evident proposition, I have to state that, in order to acquire the art of boxing, or any feat of dexterity, every movement must, in the beginning, be studied or thought out, and the appropriate action repeated again and again, until, with constant practice, it becomes automatic, almost a reflection, into which thought or reason does not enter. An animal may be taught a simple trick, but with far greater difficulty than a human being, for the latter may revolve in his mind the various steps of his performance and thereby expedite its accomplishment. Constant repetition educates the animal's nerve-centres into a prompt obedience to the proper stimulus, but I hold that thought is not associated with any stage of its performance. Walking with man is an acquired feat; but, with its full accomplishment, he does not think, now I must advance my right foot, and now my left foot; on the contrary, the locomotive and various coordinating muscles that propel and balance the body perform their functions automatically, and so also, in my view, does the expert boxer, fencer, rope-dancer, or other proficient performer of a feat of dexterity. A man with full consciousness of his danger may walk along the edge of a precipice, and the sudden blowing off of his hat, or other stimulus, may impel him to perform some irrational action resulting in the loss of his balance and his life, and many a mountaineering fatality has, in some such manner, been caused. There are ample reasons for believing that when nerve-centers are fully educated to execute certain movements they may act in entire independence of the brain, and inasmuch as this assumption may impress Hermit as "impossible science," I will adduce an illustration or two in its support:

In the Paris Journal of Anatomy and Physiology for 1869 may be found a report of an experiment performed on the headless body of a criminal shortly after execution. The skin around the nipple being scratched the arms and hands of the still warm corpse described certain movements narrated in detail, which were assumed by some to be of a defensive character, but by others to be of the same nature as those performed by a decapitated frog, which latter, upon the application of acid to a portion of its skin, will scratch the affected part with its hind leg. The frog experiment has been repeatedly performed, so that there can be no doubt on the subject, and our intimate relationship to animals, our similarity of bodily structure, is suggestive of a like localized intelligence in various portions of our nervous systems, ordinarily under control of the brain, but exceptionally otherwise.

Hermit intimates that I am "playing double;" that I am on both sides of the question, and quotes fragmentary statements that need explanation. I took it for granted that he, in common with all intelligent readers of this paper, is aware that there is no dividing line between instinct and reason, and that what some would maintain is the former, others would insist is the latter. In my article I denied that, as a rule, animals possessed reasoning power, "that they deliberate in the true sense of the term," or that they studied causes and effects, as Mr. Hallock contended. I fully concede that animals have glimmerings of reason, but cannot subscribe to Mr. Hallock's assumption that they are rational beings. The radicle or root tip of a plant manifests a certain amount of intelligence; it will, in its advance, avoid obstacles, seek out hidden streams of water, etc., and, while crediting animals with a much higher endowment, I hold that it is not comparable with our own. I believe that the mental operations of even the most intelligent animals are confined to the simplest deductive processes. For instance, take the well-known story of the crows that, observing five gunners secrete themselves, kept out of range until four had successively quitted their covert, when, in their miscalculation they swooped down to become the victims of the fifth. In this case I hold that the crows did not count in the proper sense of the term, for I cannot credit them with the invention of the requisite numerals. I do believe, however, that in the corvine brain there was formed a visual picture akin to the Roman numerals, one to four, upon a watch-face. The ancients resorted to an arbitrary sign, V; when they reached the limit of convenience in the repetition of units; the crows, however, found themselves utterly balked in their endeavor to form a mental picture of five separate integers. Let some reader try for himself and he will find that he cannot materially exceed the crow's effort. Without numerals or signs man would be unable to perform any but the most simple of minor calculations, and just as numerals

are essential factors of mental computation, so also are words of thought.

My contention that without words complex mental processes are impossible, Hermit maintains cannot stand the light of scientific investigation. Of all the differences that distinguish man from the brute, verbal language is the most marked, and while the sounds made by animals form a language, they are incapable of expressing shades of meaning, abstract ideas, or of giving free access to the realms of thought, which word Webster defines as a "capacity for the very highest intellectual functions, especially those comprehended under judgment." This obviously implies a study of causes and effects, as Mr. Hallock asserts, an operation that without words, I claim, is impossible, for they are the weights in our scales of judgment, the stepping stones over which we bound in our imaginative flights. A dog may think of a buried bone, and forthwith proceed to exhume the treasured morsel; he does not picture to himself the gastronomic delights that are in store for him, nor does he defer the gratification of his palate for the sake of indulging in such gustatory visions, as might an epicurean biped. For such ideation words are indispensable. We seldom think of an object without an association of the word that expresses it, and the great majority of persons carry on their mental processes by the use of words. They may not garb these processes in full dress, as in speech, but the verbal framework is formed ready to launch the unspoken thought. Some there, doubtless, are who largely depend upon mental pictures in their thought formations, to which latter method animals must seemingly be restricted. Nevertheless, even those persons who believe themselves dependent upon mental images may be mistaken, for the mind has signs, not only for single thoughts, but for entire chains of thought that may be as representative of words as the stenographic characters that could embody their utterance.

Hermit falls afoul of my belief that animals do not project themselves into the future, that they have no thought of the morrow, nor contemplate future joys or past sorrows, and intimates that I will be called to account by dog lovers. The inner life of animals is to me a sealed book. I do not pretend to have had a glimpse of a single page. I have an open mind upon the subject, and if my inferences are at fault, I shall be glad to be made aware of it. A conception of futurity involves the employment of a word or sign for that state of being, another for its opposite, the past, still others for the various actions associated in the thinker's mind with those conditions. I do not believe that a dog employs verbs or signs implying future action, much less terms necessary to form the various links in the connecting train of thought. Visual pictures doubtless present themselves in abundance, but they are of the past, and are not, for the reasons stated, predicated of the future.

Hermit wonders how I dispose of those born deaf and dumb, observing that my theory would deprive them of the power to think. I must remind him that such unfortunates are the descendants of thousands of language-speaking ancestors who have bequeathed them a speech-center, a special department of the brain dealing with words and vocal sounds. The deaf and dumb therefore possess an aptitude for the formation of sounds or signs expressive of meaning, whereby reasoning processes may be facilitated. All who have raised children are aware of the readiness with which they coin words, the eager persistence with which they repeat them and strive to enlarge their vocabulary. Relative to this faculty I have to refer to the numerous instances of children making a language of their own in which they conversed to the bewilderment of their elders.

Hermit catechizes me concerning my allusion to real or affected anger in animals, and says that he cannot understand what I am driving at. Let me further remind him that animals, like children, will often simulate anger, kittens will erect their backs and flatten their ears; horses when curried will playfully retract their auditory prominences, etc. I do, however, most emphatically dissent from Hermit as to his theory that cats may colloquially express a negation and an affirmation by opposite positions of their ears. I have endeavored to meet all his criticisms and objections, but probably not to his satisfaction, nor to that of dissenting readers. The subject is heavy, but, unlike my interlocutor, I cannot be charged with weighting it down with a "medulla oblongator (?)," "efferent impulses emanating from brain cortexes," etc., all of which, as science, he complacently pronounces "the pure article."

Life in the Rockies.—II.

(Continued from page 197)

THE early autumn found the deer deserting the meadows and open grounds, as is their custom, and going into thickets of jack-pines, and in the woods, making them hard to find. Luke, Bob and Bert loaded up their camp outfit and went off into the mountains to trap some for bear and get some meat, and left me to take care of the ranch, with very little important work to do. I had discovered a raspberry patch about four miles distant, and as berries and fruits were very rare about there, I thought to gather some berries. For four days I made a trip each day on horseback, riding within 100 rods of the patch, then picketing my horse, would fill my bucket with berries. I had left enough to fill my bucket again, and went back for my last bucket full the next day, and found that a bear had

been there ahead of me, and left nothing for me but a desire to put a hole through his hide. I was trying all this time at intervals to get meat, as we were entirely out, but nothing afforded me a good chance. They finally came home with plenty of venison, three bear and a wolverine, which they caught. They caught an old female black bear in their trap, and there were two cubs with her: one a beautiful dark brown and the other a light cinnamon; showing conclusively that the different species of bear, in their wild state, will inter-breed. There were said to be five distinct species of bear in that locality: the black, brown, cinnamon, grizzly and silvertip, the silvertip being the largest. The grizzlies were termed by the old hunters there "Rocky Mountain grizzly," and were not the immense size which are reported of the California grizzly. The silvertip grew to a great size. There were many wild stories of the weight of bears killed about there, but saying what a bear will weigh simply by guessing at it is very unsatisfactory. I helped my near neighbor, Cooke Rhea, to weigh a silvertip the same day he killed it, which was killed rather early in the season, before it had taken on nearly all the fat that it would have had later, and the meat and hide weighed 783 pounds, and it certainly was a monster.

One of the things that was novel to me was the method of keeping fresh meat in the summer time.

A pole about seventy-five feet high was planted in the ground, at the top of which was attached a pulley; a rope ran through this so that both ends would come to the ground. A deer, after being skinned, would be tied to one end of this rope and pulled to the top of the pole, where, on account of the very high altitude, it was entirely out of reach of the flies. When it would start up it would be covered with flies, but gradually they would drop off as they ascended, and before it reached the top the last one would be off. The air was so pure that meat would keep that way, hanging in the sun in warm summer weather for ten days without spoiling. While the sun would shine it would get quite hot during the day, but frost appeared every month in the year, and the nights were always cool enough for fire.

During the summer I made a filing on a piece of land about three miles from Wheeler's, in a neck of the park where no one could get in between me and the mountains. It was bounded on three sides by the timbered mountains, and was an ideal location from a hunter's standpoint. That was a favorite section for sportsmen from the Eastern cities and from abroad, to come for big-game hunting, and Luke secured a party of Englishmen for a hunt early in the fall, and went after them to the nearest railroad point, Laramie, Wyo. I was cutting fencing poles while he was gone, always taking my gun with me when I went out. The evening that he was due to be home with his party, I left my work about four o'clock and took a jaunt through the woods, thinking to see a deer. I was going along a steep mountain side when I saw a spike-buck coming down the hill directly toward me on the run. The deer flies were very bad just then, and he was going for the creek bottom where he could get in the willows away from the flies. He was shaking his head vigorously to fight off the flies, and was heedless of other and more serious trouble which was awaiting him. I whistled at him when he was about seventy-five yards away, thinking to stop him, but he paid no attention, but kept right on. I whistled again and again, each time louder, and still he came on. I did not want to take chances on a running shot, with my inexperience, and in my desperation I yelled at him when he was not more than thirty feet away, and still coming straight toward me. He bunched his front feet in the ground like a bucking bronco, wheeled about, and went a few jumps back up the hill and stopped directly behind a little pine bush. I shot as nearly as I could tell where his shoulders were, and he went tearing off through the woods out of sight. Having no experience I could not tell whether he was hit or not, but as soon as I went and saw where he had run I saw plenty of blood, and after following it a short distance, I saw him standing, looking back. I was quite close and thought to save all the meat I could, and shot at his head. Away he went down over the hill and out of sight, but I soon found him lying in the grass at the foot of the hill, dead. My second shot went through the butt of his ear. It was a yearling buck, and represented my first black-tail deer. He was about two miles from the ranch, and in a place where I had never been, but I took a good look around and thought I could find it again. When I got to the ranch Luke was home with his outfit, and was preparing to start for the mountains the next morning. As he wanted me to go along to bring some of the horses back, I knew my deer would have to come in that night, else the flies would have it spoiled before I could get after it. About two hours after dark I started out in the moonlight with an old pack-horse after my venison, and succeeded in bringing it in with very little difficulty, considering everything. I now felt initiated: felt that I had "ridden the goat," and was ready for any emergency.

Luke's next hunting party consisted of Dr. Job and George Scott, both of Brooklyn, N. Y.; the former was an expert rifle shot and experienced hunter, who some years later met a sad death by the accidental discharge of his own gun. It was late in the season when they came; the ground was covered with snow, and it was very cold.

My employment with Luke was ended, but as a convenience both to him and myself I engaged to stay on his ranch and do the few chores necessary while he was gone on his last trip, and employed myself building a cabin on my ranch, in which I might learn the art of baching and comply with the law in living on my ranch. I bought a horse and saddle and rode to my place in the morning, worked all day at my cabin, and went back to Luke's at night. My horse was young and only partially broken; I secured it while I was at work by tying the end of the picket rope to a heavy clog, which I could drag about from place to place that the horse might be within reach of feed. One day at noon I took my lunch box in my hand and while down to the creek to eat my lunch, took hold of the picket rope and gave it a wrap around my hand to drag the clog to better feeding ground for the horse. It was scared at the moving clog, and quick as a flash, and before I could get my hand out of the rope, the

rope was tight, and I was being dragged at a wild pace through the sagebrush, when the end of the clog ran under the roots of a big bunch of sagebrush and turned the horse a complete somersault, landing it on its back. Of course this gave me a bad hand, but no bones were broken, and in a few days I was at work again.

One very cold, frosty morning I concluded to go on foot, as I had my ax and some other things to carry, and it was too cold for comfortable riding. I took my gun along and when I was half way to my place I saw where a deer had crossed the road the night before and had gone up into the hills on the north side of the park, which were covered with a growth of small quaking aspen and pines. As I was then well along with the building of my cabin, and expected soon to move in, and had no meat yet, I thought it policy to hide my ax and other tools and give chase. This was in December, and the big game was usually all gone from those parts by that time of year to their winter quarters. As soon as I got up into the hills I found it impossible to trail the deer I had started after, for the snow was tramped by deer until it looked like a sheep corral. The sun was getting things warmed up, and the day getting quite comfortable, so I just loafed around in the sunny nooks watching for deer until in the afternoon, when I saw a bunch of about seven, as nearly as I could count, come up out of a ravine, headed by two bucks with the largest horns that I ever saw on deer. They were too far away for a shot, and I watched them until they stopped and went to feeding, then I started to crawl up for a shot. It was a difficult task, as the space between us was quite open and nearly bare of any growth. I had got along well and was over the most exposed portion of the way and within about three hundred yards of them, when I looked off to my left, and there, less than a hundred yards away, was a medium sized buck going to join the bunch, and just passing the nearest point to me. I rose up on my knees and he stopped. Just as I pulled the trigger he started, and I made a clean miss. I took three running shots at him, but failed to stop or even check him. On following the trail a short distance, I failed to find any sign of his being hit. I went right through where the bunch had been, and of course there had been a general stampede. I never saw a bunch of deer so thoroughly scattered: each one took its own course, and there remained a very discouraging outlook from every standpoint except from that of the deer. I wandered along in the general direction they had taken for some distance, when I singled out a track and resolved to follow it the remainder of the day. I had only followed it a few minutes through a dense thicket of jack-pines, when I caught a glimpse of the game only a few steps ahead of me. I fired when I saw it, and then raced after it and got a glimpse of it every few steps for quite a distance, and saw it was not gaining, but, rather, that I was coming closer to it. It seemed to be staggering and made no headway; then I was convinced it was the one I had been shooting at before. After a lively chase through the thicket I got a fair shot and killed it, and besides getting a good piece of meat secured a fine set of antlers, the first of my present collection. I could not find a mark about it except the shot which killed it, and not until two or three months later, when I skinned it, did I learn where the other shot had hit it which had affected it so queerly: it was shot through the neck, close to the jaw, and while this did not appear to disable it bodily, it seemed to paralyze it, and affected it in a way entirely different from anything I have ever seen since. The deer was nearly 300 yards away and running when it received the shot in the neck, and it was by mere chance that I happened to strike the trail of this one among all the others, so that it was only by combined good luck, rather than good hunting, that I secured it, but I went home in the evening proud of my day's work, for I felt that I had meat to begin house-keeping with.

In My Own Cabin.

On New Year's day I moved into my cabin, and realized that, for the first time, I was in my own house and on my own land, and felt like a king. The accommodations of my new home were conspicuous by their absence; it was all in one room with an open fireplace for heating and cooking. The method of closing the cracks between the logs was first to chink them with pieces of wood to make them small enough to be closed up with mud. I did not even have my cabin chinked when I moved in, but could stick my arm out almost any place. The temperature was ranging from zero downward every night. I would make my bed down in front of the fireplace, throw some big logs on the fire, and sleep till wakened by the cold, then get up and pile on more wood. The floor was that made by nature before the house was built, and was covered with the chips and pieces of timbers left from the building operations; there were neither chairs, table, nor bedstead. I was roughing it, sure enough, but was enjoying the freedom of such living, and soon had the cracks stopped with mud, and bunk and stools made, etc.

Snowshoes were the easiest means of locomotion in that section, as the snow became very deep. I went to the woods, cut a straight-grained pine, and split out pieces of which I made a pair of Norwegian snowshoes, or skis. They were ten feet long, four inches wide, and one inch thick at the middle, tapering to one-half inch at either end, the front end being pointed; then steamed and bent so that it turned up like a sled runner; lastly the bottoms were burned over a slow fire, and tallow rubbed on and burnt in until they were a rich brown color, which made them slide easy. Many a good long slide I had on them during the winter, when I did not have much else to do.

I made one trip to Walden, Colo., thirty-five miles distant, which was the nearest store. The nearest post-office when I first went there was twenty-eight miles away, but soon we had one established within three miles of my place. One stormy winter evening I started to the post-office on my snowshoes; the storm was something awful, but as it was on my back I went all right for a while. When I got out on the higher ground and began to go a little down grade, all I needed was to steer my snowshoes and the wind sent me along at a good rate. For a while I thought it was fun, but soon I realized that I was going altogether too fast for fun. I was carrying no

pole, as snowshoers generally do, and I couldn't stop, and before I realized the situation I was going at a fearful rate, which would have made it dangerous to fall or try to jump off. There was no way for me to stop; I couldn't see three rods ahead, on account of the flying snow, so went to yelling at the top of my voice to warn any living thing that might be in my way. After going about a mile at that rate, I got down in lower ground where the wind did not strike so hard and slacked up enough to get control of my slippery steels, and was soon safely at the post-office. The night was one of the worst I ever saw. The mail got in late at night, and I tarried with Bert Reed, who lived near the post-office all night, rather than face the storm.

By the first of April my supply of meat was exhausted, as was that of some of my neighbors. Harry Baugh, a brother bachelor and neighbor, and myself plotted a campaign whereby we might get some meat. We loaded a wagon with bed and a few days' provisions, and, after pulling through many old snow drifts, got out on the "Hunter Flats" and into the foothills along the Platte River, where both deer and antelope ranged all winter. As we were pulling into the proposed camping ground we saw a deer rounding a point in front of us and disappearing in the foothills. It was nearly night, but I took my gun and went after it, while Harry made camp. I found plenty of deer sign, and saw several during the little time I was out, but failed to get any. The ground was bare and dry, as the snow had been gone from there for some time. We made our bed under the wagon, tied the horses to the wheels and rolled in. In the morning, a little before daybreak, I looked out and found everything covered with snow. Even my shoes had been laid a little too far out and were full of snow. We had a hasty breakfast and were out in the hills early to take advantage of the snow. When we had gone only a short distance, we found a fresh trail of a half dozen deer which we followed till the tracks led down a steep hill into the woods. I thought from the way things looked that they would be found down in the woods nearby.

I told Harry to wait there a few minutes while I would go a half mile to a wooded knoll which looked like a likely place for them to pass if he scared them out. After waiting till he had time to drive them out, I left my place of watching and hunted till noon without seeing anything. We met at camp at noon, moved our bed and camp outfit into a deserted cabin, had dinner, and then started out on the open rolling country for antelope. We soon saw a bunch of perhaps twenty, but they were in a hard place to come up to; we maneuvered nearly all afternoon, and finally had them in position. I sent Harry to a point past which I felt confident I could drive them. There was a steep bluff along a dry stream bed along which he could travel and be out of their sight. I waited awhile, then started to crawl as near to them as I could before opening fire. Before I got nearly to where I wanted, I heard him shoot, and raising up I saw them crossing at the place he had started for. They had taken alarm and spoiled our plans. They only went a short distance till one went off to one side and laid down, showing that his shooting was not all wild. We felt quite certain of getting it, and went after it; before we got very close it was up and off, and though we made the gravel fly on all sides of it, we did not hit it. Had we waited patiently for an hour or two we could easily have gotten it, but we kept right after it until the sun was nearly down, when I started for camp to care for the horses, while he kept on as long as he could see, but failed to get it.

The next morning we went into the hills after deer; we were separated, and I was passing the place where I had been watching the morning before, when I saw in the wet ground very fresh tracks of deer in a sort of path which led down to the river which was near by. They had been going both ways, and I followed carefully until I saw plainly that they had come up from the river last. When I got the right end of the trail I started after them carefully, and only went a few steps until I saw one down in the woods with its head directly away from me. I knew I was not seen, and the wind was in my favor, so I took my time, to make sure of getting a good shot. I got behind a big tree and crawled down several yards nearer; when I got to the tree I looked around it and saw the one I had first seen standing as it had been, and another standing broadside near by it. I was within easy range, and gave the first deer the first shot, which killed it dead in its tracks. Of course the other one naturally stood still, and I just as naturally sent the next shot after it, which sent it tearing through the woods out of sight. I saw no more just then and went down to the one I had killed. Just when I got to it I saw another one away up on the hillside making off by great bounds; I fired a couple of times at it, but it only served to hurry it along. I took the trail of the second one I had shot at and found it dead only a few rods away. Harry had heard me shoot, and, after several calls and answers, he came to me and when I said I had two deer to my credit he did not look a bit more dejected that he did the evening before when I left him on the antelope trail. That was all the game we got on our trip, and we were well satisfied, as neither of us were experienced in hunting.

Amos Pennoyer was camped near the Hunter ranch, a large stock ranch in Wyoming, ten miles from my place, and was getting out fencing and building timber from the mountains for use on the ranch. He expected soon to move up into the mountains about four miles from the ranch, where he had already built a cabin, and wanted to hire some one who could cook, hunt, chop in the woods or drive team. I was recommended to him by one of my neighbors as possessing all the required qualifications, and was employed. The camp was still in the big meadow near the ranch when I began work. There was no meat in camp, and I took my gun along the first day we went to the mountains for a load of timber. When coming down the mountain in the evening with a load, I saw a deer cross the road ahead of us.

I told them to drive on and I would tarry a while on the deer trail and come in later. I soon found it was no use following it, and went on down the timber road till it emerged into the open foothills, when I saw a bunch of antelope directly on my way to camp. It was rolling, hilly ground. I went out of sight of them to get nearer,

and when I came up on the next rise of ground I saw nothing but a lone buck, and he was going straight away from me and toward the meadow where the camp was. He was nearly a half mile ahead, and I would go on a smart run while on low ground and out of his sight, then when I would come up over a rise and he was in sight I would wait until he was gone over the next ridge, then make another run. Thus I worked until he went over the last bluff which overlooked the meadow, where I thought he would surely stop. When nearing the rise where he had last disappeared, I crawled through the sagebrush with great care, and when just about the top I raised my head to investigate, and there he stood, broadside, not over forty yards away, and, fortunately for me, with his head turned around so that I did not come within his vision. Mr. Pennoyer and some others were at work in the meadow, and he was watching them. I rose up in position to shoot when he turned his head and of course saw me, but it was too late; the gun cracked, and he reeled, fell partly down, got up and ran a few rods and fell dead. Mr. P. heard the shot and saw the antelope run and fall, and needed no further notice. He gave orders to his son, which I could plainly hear, to hitch the oxen to the wagon and go up where I was. I dressed my antelope, which was a fine buck with perfect horns, and waited until the wagon arrived, congratulating myself all the while that I had started out so well with my hunting, for I hoped to retain that part of my employment anyhow. Even in that land of pure air, pure water and all that was conducive to good health, the human body was not exempt from the ills that sometimes break in upon us to spoil the fun. For two days and nights I suffered all the tortures which an aching tooth can inflict. Then I realized, as I have many times since, that all the good things and all the conveniences cannot be centered in one place. While I was enjoying to the fullest extent the wilderness and grandeur of the surroundings and the abundance of game, I would need ride fifty miles to have a tooth extracted or secure the services of a doctor. Some years later, in mid-winter, while living on my ranch, I had a siege of the same kind; for two days and nights I suffered without closing my eyes in sleep, knowing what a trip to a doctor meant at that time of year. There was no doctor nearer than twenty-eight miles. I stood it as long as possible, then mounted my horse, and for two long days I rode through the deep snow with the thermometer away below zero. The second day on the road the tooth stopped aching, but I kept on, and when at last I got to the doctor's I had two pulled to be sure of getting the right one.

A Game Co-ntry.

The time soon came, and was hailed with delight, when we moved into our cabin up in the mountains, where we had plenty of firewood, ice-cold mountain water at the door, and abundance of game all around us, besides being right at our work. It was my business to do the cooking, which necessitated my getting up about four o'clock in the morning. How enjoyable life was: living in the woods, chopping in the pine timber, going to bed at dark and getting up at early dawn full of vigor, and working in peace, without the din, turmoil and vexations of thickly populated surroundings.

One evening, after supper, at the suggestion of my employer, I took my rifle and went out to look around for the most likely places to find game, as we were about out of meat. He said he would prefer elk meat, if it was all the same to me. When I got about a mile from the camp I found a swampy piece of ground where weeds and grass were grown rank.

I could see by fresh sign that it was a favorite feeding ground for elk, but it commenced raining, and rained all evening, so that I took a straight cut for home without hunting any more. I was wearing a pair of moccasins made of raw elk hide, and when I got to camp they were something like two old dish-rags. My orders were to go out the next morning and hunt till I got meat. The next morning was bright and clear, and I started straight to the place where I had seen the fresh elk sign, for I had never had a shot at an elk up to that time, and was especially desirous of trying my luck. I was making my way through a thicket of jack-pines, near to the place I was going, when I saw, lying on top of a little rocky ledge, a lynx. Of course my first impulse was to try and kill it. I crawled through the pines until within about forty yards of it, when I felt sure I could kill it. I laid my gun across a log to get a deadly aim, and was pressing the trigger, when I thought thus: "My employer has sent me to get meat, and here I am wasting my time and jeopardizing my chances for meat at the favorite place to which I was going by shooting something that will not be worth anything to me or anyone else." I just lowered my gun and crawled back out of sight and left the lynx there, the first, last, and only chance I ever had to shoot a lynx when I had a gun. They are very shy, and seldom seen, but some years later, while Bert Reed and I were in the woods with an ax, prospecting for a good pole patch where we might find good fencing timber, we saw a large lynx standing on a log about fifty yards away, looking at us without any apparent fear. We started slowly toward it, expecting every minute for it to break into the thick cover of a jack-pine thicket nearby, but to our surprise, when we were within thirty yards of it, it started walking leisurely around us and came within twenty yards of us. I picked up a large stone and proposed making a sudden dash at it, thinking to get a few steps closer and then throw the stone, with a bare possibility of killing it, but I hadn't figured that while I was making a dash of a few steps, it was capable of making a dash of a much greater distance in the same time, so that, although I made an ineffectual throw, I might have done so before startling it. Only another case of the "hind sight better than the fore sight!" So it is that sometimes an ordinarily shy and wild animal will act stupidly and so entirely different from that which is expected of it, that there is no wonder authorities differ in dealing with the habits of wild animal life.

In a few minutes I was at the place I had started for, and while walking silently and cautiously along saw, about 100 yards away, two bull elk start slowly trotting off, alarmed at my approach; they soon stopped and one turned broadside. I shot at it, then they went a little

Maryland Ducking.

(In reply to a request from the Baltimore News, ex-Mayor Latrobe, who, like many of his fellow citizens, is fond of the Maryland sport of duck shooting, has written the following article on that subject, and also told what he knows about the origin of the Chesapeake Bay dog.)

Maryland is the home of the Chesapeake Bay dog. This animal is the product of the sport of duck shooting.

The canvasback and the redhead, with the diamond-back terrapin, the fish, the oyster and the crab of the Chesapeake have given to our bay the reputation it everywhere enjoys of producing more epicurean delicacies than any one other sheet of water in the world.

In the language of a former Mayor of Baltimore, whose well-known birthplace was Liberty Hall, in Kent county, "Maryland is the gastronomic center of the universe." But the attractions of these waters are not confined to the epicure; they also offer unequalled sport to the lover of the dog, the rod and the gun.

Before the days of gill nets, purse nets, sneak boats, New York prices of \$80 to \$100 a dozen for diamond-back terrapins, naphtha launches and other diabolical contrivances and inducements for the destruction of game and fish, the Chesapeake Bay was a sportsman's paradise. Duck shooting twenty years ago was, in the writer's opinion, the king of sport; and even now some of the clubs on our bay and its tributaries, the Gunpowder and Back rivers, will afford in fall and spring some fair days' shooting. How familiar to old Maryland duckers are the names of Back River, Middle River, Carroll's Island, Miller's Island, Grace's Quarter, Bowly's, Biddison's, Liego's Point, St. Domingo, Cockle's Point, Townsend's, etc.! At nearly all of them, like Ichabod, their glory has now departed. The club houses are there, and the wild celery still grows in the waters; but the ducks have found other feeding grounds.

The Old Club Houses.

In the old club houses will be found the record books, showing the names of the members, the big days of sport, the remarkable shots, incidents of jolly times, names, pedigrees and performances of the dogs, names of servants, etc. But the advance of civilization, shell roads, fishing clubs, trolley lines, bicycles, automobiles and other ingenuities and iniquities (in a sportsman's opinion) have had and are having the same effect on the duck shooting of the upper Chesapeake and its tributaries that similar agents of civilization, together with the improved methods of destruction, have had on the buffalo and game of the West.

At a few of the clubs where, as I have said, there is still some sport, the purity of the breed of the once famous Chesapeake Bay dog is still maintained, and pedigrees of their ancestry are kept with the same care as are those of Alderney cattle and thoroughbred horses. Around the story of the origin of these dogs are many traditions, some of them actually believed, especially by the old colored people of what is called the "neck (or shore) country" around Baltimore. One is that this breed of dogs is the result of a cross between the otter and the Newfoundland. Hence many strains are designated as belonging to the "otter" breed. The true story, however, as far as the writer knows, is as follows:

Origin of the Bay Dog.

Many years ago a vessel from Newfoundland ran aground near an estate called Walnut Grove, on the shores of the Chesapeake. This estate belonged to Mr. George Law, a member of a well-known Maryland family. On board the ship were two Newfoundland dogs, which were given by the captain to Mr. Law in return for kindness and hospitality shown to himself and his crew. The beginning of the Chesapeake dog was a cross between these Newfoundlands and the common yellow-and-tan colored hound, or "coon dog," of that part of the country.

The marked characteristics of the Chesapeake Bay dog give every evidence of the truth of this story. The strong power of scent, its hardihood, its shorter hair, its medium size and its remarkable endurance come from the hound, while its love of water, its powers of swimming, its extraordinary ability to endure cold, its furry coat, wonderful intelligence and general good temper are all due to the Newfoundland. There has doubtless been added, from time to time, some water-spaniel cross, which has helped its remarkable retrieving qualities. The yellow-and-tan of the hound, combined with the black of the Newfoundland and the introduction of the spaniel, produced the liver color of the true Chesapeake Bay dog. In course of time the Chesapeake Bay has, in Maryland, become a distinctive breed.

Carroll's Island Stock.

At the Carroll Island Club, of which the writer has been a member for over thirty years, and the records of which go back for over a century, this strain of dogs have been carefully bred, and for many years the pedigrees have been kept. The same care in breeding the Chesapeake Bay has been followed at some of the other clubs.

From Carroll's Island the stock has been sent to the Currituck Sound clubs, and also to the Pacific Coast. On the island are still preserved many of the old names of celebrated dogs. We have now a Tinnie, Turk, Dan, Jack, Gill, Mollie, Lady, Tim, Drake, Belle, etc., the wonderful retrieving powers of whose ancestors are fully set forth in the records of the "big bags" of days gone by.

Methods of Duck Shooting.

At the Maryland ducking clubs there are three different kinds of shooting, viz., point shooting, bar shooting, and shooting over decoys. In point shooting the sportsman is stationed in a blind—that is, a wooden box—erected on the end of a point, around which the ducks fly near enough to be within shot. Often a few wooden decoy ducks are anchored near the point, with the effect of drawing the ducks in closer to the gun of the sportsman. In bar shooting no decoys are used, the blinds being erected on the bar, over which the ducks fly early in the morning, or before dark in the evening, in moving from one feeding ground to another. Decoy shooting is from

a blind or box located on the shore or at the end of a causeway about 50 or 80 yards off shore, in front of which are anchored about a hundred decoy ducks. At Carroll's Island we have bar, point and decoy shooting. For bar shooting, which is altogether overhead, large guns are used—either a heavy No. 8 double gun, or, what is more effective, a No. 4 single gun. The charge is No. 1 or No. 2 shot. In the single gun the writer uses 12 drams of black powder and 2½ to 3 ounces of shot. In point shooting a No. 8 double or No. 4 single gun is used; and, over decoys, a No. 8 double, with a charge of No. 4 shot. At the Currituck Sound clubs, where the birds come nearer and where the sportsman sits in a temporary blind erected on the edge of a marsh, a lighter (No. 10) gun and smaller shot are used. At the Chesapeake clubs a light southerly or easterly wind, with a fair tide, is desirable. In a stiff northwester, producing, as it does, a very low tide, the duck shooter might as well remain in the house.

The dogs are trained to lie down near the blind, and to start for the retrieve only when the bird falls.

Sinkboats on the Susquehanna.

On what are known as the flats of the Susquehanna River, near Havre de Grace, duck shooting is done from what are called "sinkboats"—that is, from a boat, or rather a float, with a coffin-shaped box in the center, where the sportsman lies on his back, his head supported, of course, by a pillow, with two light No. 10 double guns across his body, the whole concern being little above the surface of the water. This float is surrounded with 150 or 200 decoys, and is anchored in the feeding grounds of the ducks. When the birds, attracted by the decoys, come within shot, the sportsman rises to a sitting position, and, if the flock is large and the gunner is skillful, he can sometimes get in all four of his barrels. The retrieving of the game is here done by a boat or tender, which comes out for the game after the morning's sport is over, or, it may be, at intervals when the flying slacks up.

On the Susquehanna the shooting is permitted only three days in the week, the other days being known as rest days, when the birds are not disturbed on their feeding grounds. The same rule prevails at the clubs on Currituck Sound. The Carroll Island Club, to which the writer belongs, is located at the west side of the mouth of the Gunpowder River. The majority of its members are from New York City. This club has been in existence for over a century. It opens on Nov. 1 and closes on March 31. In addition to ducks, there are large numbers of geese and swan that feed in the waters of the Chesapeake. They are known among the club members as big game, and afford good sport, although as a table luxury not much appreciated by the epicure. A young goose or swan is not unpalatable. It is a common saying, however, that an old swan or goose, especially the former, must be carved with a hatchet.

Story of a Swan.

At Carroll's Island, on one occasion, a swan was killed, imbedded in the breast of which, on being prepared for the table, was found a barbed iron arrow head. The arrow head was sent to the Smithsonian Institution for investigation. It was returned with the diagnosis that it had probably been shot from the bow of an Indian in Alaska, thus indicating that this bird had received a severe but not mortal wound from some sportsman in the Arctic regions. How long ago was a matter of speculation, for a swan is said to live for a century.

The Chesapeake Bay dog is not really in his prime under the age of two years, and seldom lasts over four or five. The hard service of retrieving game in very cold weather, often when the water is filled with floating ice, brings on rheumatism, stiffness of the joints and lung trouble. This, of course, ends its usefulness. The color of this breed of dogs is liver, or a reddish brown, often with a narrow white frill on its breast, and is especially distinguished by its bright, golden-colored eyes. There are what are known as the smooth-haired and also the close, curly-haired strains, but on both will be found, by parting the hair, a fine fur next to the skin. To this fur can doubtless, in some part, be attributed the story of its otter origin. The Chesapeake is essentially an outdoor animal; it thrives best in cold weather, and suffers much from the heat and flies in summer. If you want to keep your dog in fine condition, do not let him lie before the fire in the sitting-room of the club house.

To the writer much of the enjoyment of duck shooting has been found in watching the action of the dogs in retrieving and their ingenuity and resourcefulness in capturing a wounded and diving bird. All of this, however, while perfectly familiar to the old duck shooter, is difficult to explain to a layman.

Advice for Sportsmen.

In duck shooting at the Chesapeake clubs the costume worn by the sportsman is of a drab or leather color. Many wear a leather coat, which protects the body from the wind. Water-proof long boots are essential, and also a leather or khaki-colored cap. In wet weather a leather-colored water-proof coat is, of course, required. The object is to accommodate the dress, as near as practicable, to the color of the reeds or dried grass of the shore.

When the flight of ducks approaches the shore where the blind is located, the object of the sportsman must be to keep perfectly still, as the slightest motion will divert the flight of the birds. Don't raise your gun until the ducks are within range; then rise, put up your gun, catch the game with the eye over the sight, keep your gun moving, recollect that the bird is flying very rapidly and if you fire directly at the object of your aim you will shoot behind it; therefore throw your gun some two, three, or even four feet ahead, and then pull the trigger. It is best, in bar shooting—which the writer generally indulges in—to let the ducks pass a little way before firing, unless the flight is directly overhead. Don't shoot "face and eyes," as the term is; that is, when the game is coming straight at you, Resist the temptation and wait until the birds

further, and I kept on shooting; soon one staggered and fell, while the other remained standing there until a shot struck him about the shoulder, when he whirled around and disappeared over the bluff. I went up to the one that had fallen and found him between two big logs, and wedged in against a big rock, so that I couldn't move him one way or the other, and certainly had a most interesting time getting it dressed, and thought ere I was through that I had truly earned my bread that day by the sweat of my brow.

After following the trail of the other one for a very short distance I saw it get up and go off at a very unsteady gait. I watched it, and before it got out of my sight it laid down behind a log. I crawled up within about fifty yards of it, which was as close as I could get without being seen. Its entire body was behind the log, and only its head and part of its neck were exposed. I aimed carefully at its head, and when the gun cracked it never moved. When going out for a short hunt like that I invariably and very foolishly took only what cartridges were in the magazine of the gun, and here I discovered that I only had one cartridge left. I concluded to try its neck that time, and when the gun cracked its head dropped out of sight and my success was complete. I found a bullet hole through the butt of its ear, close to its head, which accounted for next to the last shot. I was back to camp at ten o'clock and the boss was well pleased with my report, and said as one elk was all we could use, he would take the other one to the ranch and sell it and give me the proceeds, which he did. He hitched the oxen to the running gears of the wagon, which he coupled up until the front and hind wheels almost touched, and went right through the woods, over logs and anything else that came in the way, lashed both elk whole on the wagon, and brought them into camp through country where ordinarily a person would hardly think it possible to ride a horse.

Game and the Settler.

As has always been the case in any new and thinly settled country where game is abundant, there was no such thing known as a game law, and the settlers killed game as the needs demanded if they could. The sentiments in regard to hunting change as conditions change. The "sportsman" of to-day naturally condemns the "hunter" of the past for their excess in the killing of game. Excess it would seem as seen from the present, and yet could those of the present know all the conditions as they were, there might be less feeling of condemnation. Not that there have not been excesses in the extreme, where an abnormal thirst for gore seemed to be the only cause for killing. There always has been, and perhaps always will be, a blood-reveling, life-destroying sort of bipeds which only the law and active executors of the law can keep from killing everything in sight, but much game has been killed which, in quantity, would seem extravagant as we look at it now, with the game becoming so scarce, which in reality was not so. In the days and locations of abundant game, the inhabitants were few, and the means for securing a livelihood limited, and though the States had their game laws, they were a dead letter to the thinly populated districts where game was plentiful, and why not? The object of preserving game, as is the preservation of any commodity or luxury, surely is that it may do the greatest possible good. When the pioneer, living where there were few conveniences and no luxuries, killed a deer every time he was in need of meat, and sometimes where he had an opportunity to furnish someone else with meat and receive in return some necessity which he could not otherwise have secured for himself, then it was that the greatest possible good was being realized from the game thus killed. Even though they killed beyond the limit in numbers, and out of season, that which he killed was put to better use and proved a greater blessing to mankind than that which was preserved to a later day, when the conveniences and luxuries of civilization were accessible to all, and which was killed by the sportsman just for pleasure, while perhaps the carcass was left in the woods where it fell, as is often the case where antlers are the prime object of the hunt.

There are old timers who refrain from giving out interesting experiences for publication because of the censure to which they are liable for having done so much toward the extermination of game. Certainly it has not been the residents of the game districts of the past, killing game for their immediate use, who have been, for the most part, responsible for the rapid extermination of game. It has been those who have made hunting a business. The buffalo would have lasted some years longer had they only been killed by settlers living within their range, as their needs for meat demanded; but, after all, it is not such a great misfortune that they are so nearly exterminated, for it would be an utter impossibility for them to survive in any quantities under present conditions, with their ranges all overrun by cattle and sheep. Had they been preserved from the hunters, it would have simply been a matter of starvation with them, as it evidently is at present with elk, in places where their winter range is overrun by stock. Of course the matter of feed is of greater importance in the preservation of elk and buffalo than of the other game animals, since the others are not so dependent upon that which is eaten by stock, and live in places which are more inaccessible to stock. We might as well try to preserve fish without water as to try to preserve and perpetuate our game without preserving with and for them the territory necessary for their sustenance and natural seclusion. In the years past our country has been so engrossed in its industrial activities and growth, there has scarcely been time to think of the necessary conditions for game preservation, and laws have been enacted and enforced with some degree of exactness to protect the game on the public lands from the hunters, while the matter of its subsistence has hardly been considered. Never has there been so good a time for the securing of legislation to perpetuate forests and game as the present. With the most enthusiastic sportsman of all—our President—now at the head of our affairs, it is a most fitting and hopeful time to put forth every effort along the line of preserving the forests and game, which belong to each other.

EMERSON CARNEY.

[TO BE CONCLUDED.]

are directly overhead or else have passed a little way to the right or left.

"The Royal Family."

The ducks of the upper Chesapeake are the canvas-back (or, as we at Carroll's Island call them, the "royal family"), the redhead, baldpates or widgeons, blackheads (both creek and bay), black mallards, green-head mallards, coots (or, as they are called in the North, ruddy ducks), teal (both blue and green winged), dippers, summer ducks and crowbills. These are all fit for the table. Then we have the morganza, fisherman, golden eye, whiffler, hell-diver, tarpot and loon. These latter we call trash ducks, and are not shot at by an old sportsman. In addition, we have the wild goose and the swan.

Horse racing may be called the sport of kings (probably because it requires almost the revenue of a king to indulge in it), but the writer is sure that many New York and Maryland gentlemen will agree with him that duck shooting, with the life, good company and good fellowship of a Chesapeake Bay club house, offers in many respects attractions which would not be regarded with indifference by the right sort of a king.

New Hampshire Game.

BIRDS are very scarce here this season. Usually during the summer I see many young grouse while driving and when trout fishing. The past summer I saw but one young bird. On the opening day I went out. The weather was too hot for any comfort. I started two or three old grouse very wild and far apart. Twice I found an old bird and one young one together. I got three shots, killing two birds, and then gave up. A neighbor, who knows the covers well, has been working over a great deal of ground during the last three days. So far he has killed one woodcock. As he expressed it, "There ain't no partridges."

Deer are doing well here. A few days since five were seen quite near my house. These deer are protected at all times. There has been a change in our deer law as to those parts of the State where there is an open season. The season now opens with October and closes with November. The non-resident must take out a license. When our neighbor Maine passed the hunting license law, New Hampshire felt bound to follow. Those who favored the New Hampshire license argued that if Maine did and New Hampshire did not, too many hunters who had gone to Maine would come to New Hampshire, and too many of our deer would be killed. During the last few years I have met some of our non-resident deer hunters on the hunting grounds and on the trains on their way home. Very few had killed anything. Many of them came for an inexpensive outing, putting up at a farm house, and spending their days cruising about in the woods and in watching apple trees near the woods. They were very sure to see quite fresh deer sign; sometimes they saw a deer, and once in a while got a shot. Now such a trip of two weeks, with Boston as a starting point, could be made under former conditions for not over twenty dollars, and I think for something less. I think our visitors, as a class, paid many times over the market value of what they killed.

I see by a recent issue of FOREST AND STREAM that the Maine guides are considering the raising of their wages as guides. Perhaps they think that under present conditions there may be a falling off in the number of their customers, and the only way to even things up will be to make those who come pay for those who do not.

Maine passed the non-resident hunting license as a means of more revenue. New Hampshire passed it because Maine did. (This is the only clear reason I have heard of.) Whether or not it will prove a success remains to be seen.

C. M. STARK.

DUNBARTON, N. H., Sept. 18.

A September Tide.

A WOMAN, a Man, and a Shover stepped successively into the boat, which was then pushed off from the shore. The Shover took the oars and with short, quick strokes rowed off up the placid river, floating on the rising tide. The day was warm and bright, just enough breeze was coming down the river to wrinkle its surface and blur the reflections of the tall trees that overhung the banks. It was an ideal day for rail shooting, and the only thing needed to make it absolutely successful was the birds.

"Where are you going to take us to-day, Shover," said the Man.

"I wish I knew," replied the Shover. "Two boats have already gone up the river, and a naphtha launch towing another one and four more are coming from down below; besides that there are two boys in the creek, and a boat already shoving on the island. There's going to be more boats than there is ground to shove over, and I don't believe that there are any birds anyhow."

"Have you seen no newcomers yet?" asked the Man.

"Not yet; at least, none to amount to anything. There may be a few dropping in, but the nights are not cold enough yet to bring them along. Still, last night was the coolest we have had yet, and there was a moon. May be you'll find a few birds. I'm going up now to Meadow Creek. That's one of the best spots for newcomers, and if any dropped in last night we'll see them there."

"No you won't," said the Man. "There goes a boat now into the mouth of Meadow Creek. It's no use for us to go there."

The Shover took a long look and shook his head as he said: "So 'tain't. Let's go over to Middle Deestrick." A very few moments brought them close to the shore, and a second or two later the boat's sharp prow was bending aside the grass blades with a rustling sound. The Shover and the Man changed places, and then from the bow the Woman asked, "What shall I do?"

"Stay where you are," said the Man, and reaching forward he rested the double barrel gun on the thwart, opened the box of cartridges and placed it on the bow, and then, handing the gun to the woman, said to her, "Now here's your gun."

It was her first lesson. True, there was a tradition

that once long ago she had shot a gray squirrel sitting on a limb, and a partridge walking across the road, but she had never shot at anything flying, and just now did not appear greatly to wish to. She asked many questions, of which "What shall I do?" "How shall I do it?" and "What is this for?" were typical; but one by one the different operations were slowly performed, and at last the gun was loaded and held at half cock in the left hand, the muzzle pointing well up and to the left, while the right hand grasped the grip, and the right index was extended along the trigger guard.

"Now," said the Man, "we are going to push the boat through this grass, and you must keep a sharp lookout in front of the bow and on both sides, and if a rail jumps up must try to kill it. If it flies straight away from you, aim at the bird and then raise your sight very slightly and pull the trigger. If it flies across you, put the gun to your shoulder, follow the bird, and when you have sight on it move the muzzle a foot in front of it and pull the trigger. Stand with one of your feet in front of and one behind the forward thwart and press either the calf of your left leg or the shin of the right against the thwart. Rest your weight chiefly on your left foot, and when the boat moves, balance yourself by moving your body on your thigh and knee joints, and not by shifting your feet about. Now keep a sharp lookout, and keep your wits about you. There is plenty of time for everything, and it is not worth while to get excited." Then, turning to the Shover, he nodded and said, "Ready."

The boat began its slow and steady motion through the grass as the skillful Shover propelled it by means of his long and deftly wielded pole. On either side the boat the grass rustled and creaked as it was pushed away. There was the ripple of the water, the drip from the pole as it was dragged forward to be put on the bottom again,

grass. Perhaps he was wise to insist on being answered, for some people are so careless and unobserving that they do not see things directly in front of their noses.

After the boat had passed this shooter, and as it approached the place where the rail had alighted, all were on the lookout for the bird, and finally, when it sprang up twenty yards away, the Woman, after a little fumbling, said, "He's too far off." "No, he's not," roared the Man, "shoot; shoot;" but by that time the bird was too far off, and besides that had dropped in the grass. A second time this same thing happened, the Woman imagining that the bird was too far off, while the Man abused her roundly for not shooting, as she should have done. The third time, as they approached the place where the rail had alighted, a dark bird sprang from the grass, and though the Man said "Don't shoot," the Woman killed it neatly, thus exposing herself to the danger of arrest by the authorities, for the fowl that she had killed was not a rail but a blackbird.

"Load your right barrel quickly," said the Man, and the Woman no doubt tried to do so, but before it was done, the rail sprang up, the shot was fired and missed, and the rail flew off over the meadows, never to be seen again.

And now came a period of waiting. The creek almost always yields a bird or two, yet less than an hour before this it had been shoved over by two boys. Still, it was thought that possibly a bird might have wandered out into the grass, so up the creek they shoved. It was a fruitless excursion, for nothing was seen save a little green heron, which took to wing while they were yet afar off, and hastily flapped its way toward the woods on the shore, and a pair of sharp-shinned hawks that had come down to the river to secure a dinner of blackbird or reedbird and were chasing these nimble flyers about

SHOVING THROUGH THE GRASS.

the curious chuckling noise of the little marsh wrens, which were seen now and then darting among the grass or across the boat's path, the cluck of the blackbird, the mellow tinkle of the reed bird's note, and constantly the faint patter of the falling seeds, where the wild rice fell into the boat as the stalks were pushed apart. As the boat entered a little opening where no grass grew, a young marsh wren, just from the nest, gave a mighty hop from one stalk toward another, and, losing his foothold, splashed down into the water. This did not trouble him much; with head and tail thrown back, he looked saucily at the advancing boat, and then by rapid wing beats propelled himself over a yard or two of open water, and reaching a grass stalk clambered up on it, and shook himself unconcernedly.

Suddenly the Man said, "There's a rail in front and to the left, running in that grass. Don't you see him?" and a second or two later, the bird flew a dozen feet, but before a shot could be fired, alighted and stood on a patch of floating grass.

"Shoot him on the ground," said the Man; and as he spoke the shot rang out and the poor little bird fell over.

After it had been recovered, the boat moved on again, and had gone only a short distance when another rail sprang from the grass, and after a ten-foot flight alighted on the meadow in plain sight. This likewise was killed and boated.

Again the boat moved on, and for fifty or sixty yards nothing happened. Then suddenly a fine big rail hopped up twenty yards ahead of the boat, swung off to the right, and was dropped with the first barrel as neatly as could have been done by the oldest gunner. For a moment the Man was stupefied with astonishment, for the shot appeared to have been made so easily and so naturally that it hardly seemed as if it could be accident. Warm congratulations were now exchanged.

Middle District is not a long piece of grass, and by this time the boat had reached its northern end, and turned to come down again. After it had turned, and while it was in a thick piece of high grass, a rail sprang up, was seen for a moment, and then dropped down in some low grass. At this time, another boat was seen shoving into the lower end of the piece and coming toward them. The man in the bow was watching carefully for birds, but seemed to have eyes for nothing else, until the two boats were sixty or seventy yards apart. Then he shouted, and then shouted again, and finally a third time; evidently anxious to let the approaching boat know of his existence and whereabouts, though of course he had been seen from the moment his boat entered the

over a patch of corn grass into which they continually dived to escape their enemies.

Of the other boats none were apparently doing much better than this one. Notwithstanding all the guns on the river, a report was heard only occasionally, and some of these, it was suspected, were at blackbirds or reedbirds rather than at rail. The creek having been ascended on one side, the boat came down on the other, and as it was now just the top of high water, the Shover pushed into the little bunch of cattails growing at the mouth of the creek, following a road beaten down through the thick rushes by the passage of an earlier boat. Hardly had the boat entered the "cats" when two rails sprang up before it. One swinging a little to the right was shot at and ingloriously missed, while the other to the left was not seen at all.

The gun being reloaded, the boat moved on a little, and the bird that had been shot at, getting up again and endeavoring to seek the asylum of the thicker cattails, was neatly caught when three feet above the reeds and turned over.

The cattails were thick and neither the Man nor the Shover thought it possible to find this bird. Nevertheless the Shover threw his block, and then pushing the boat to shore the Man stepped overboard and wading around into the cattails about where the bird fell, began his search for it. At first it was not seen, but that was not surprising, and the Man was carefully turning over the beaten down and floating stuff, to see whether the bird had not fallen through it, when happening to raise his eyes to the right, he saw the rail hanging by the neck, caught in falling where a blade of the cattail forked off from the main stem. The position for a rail was an odd one, though more than once the Man had seen the same thing happen in woodcock shooting in thick cover; his attention on two occasions having been called to the bird by the rearing up on his hind legs of the dog, which by eye or nose had discovered the bird's odd situation.

The Man cut off the cattail and carried the bird out to the boat without touching it, having first, however, recovered the block, which had fallen a little short.

Backing out from here, the other rail was started once more, but—painful as it is to relate it—was missed.

This ended the day's work, for not another bird was started.

OLD MAN.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The Preserve Question.

Editor Forest and Stream:

Coahoma says "the opponents of large game preserves for private use have given no clear indication as to what agency is to be employed by way of correction."

Allow me to suggest a possible method: That all game and fish be the property of the State, and that the land owners have no property rights in them whatever. That all uncultivated land be open to the public for hunting and fishing, unless declared by the land owner to be a State preserve, under laws made for the purpose, on which no hunting or fishing shall be done by the public or the owner under the same penalties for violation for the owner as for the public. That the public shall not be excluded from any uncultivated land except within a short stated distance of an occupied dwelling. That individuals shall be liable for damages done by them to the property of the land owner, and that no fires shall be built on any land without the owner's consent.

Unselfish millionaires would then be enabled to show their public spirit by establishing preserves where they could share with the public the pleasure of seeing game really preserved, but not raised to be slaughtered.

All this, of course, conflicts with the sacred laws of ownership which are invoked as though original land titles were derived directly from a wise and very discriminating God instead of from a more or less remote proprietor whose title was his brute strength. It may be revolutionary to a slight extent and unconstitutional. So was the overthrow of slavery, and so have been nearly all reforms. It is not lawless, for it is a proposition for action by law.

Wealth is not a question of industry and thrift except to a limited extent, but of opportunity and of parentage.

wrong kind of persons and should take a notion to make us get out of their preserve? As near as I can figure it out we would all have to join "The criminal element" or cease to exist. This side of the question is submitted to the careful consideration of those who seem to be willing to place everything in the keeping of the millionaires.

In regard to trespassing on farm lands, I would say, farm lands as a rule are not good hunting ground. They are necessarily improved land, i. e., land on which the labor of mankind has been expended, and they are devoted to a useful purpose in producing things which are necessary for the existence of mankind. Therefore, it is right and proper that trespassing on such lands should be restricted.

On the other hand, wild lands, i. e., lands which cannot be cultivated, should not be subject to private ownership, but should be held by the State as a playground for the whole people.

I believe that an all-wise Creator created them for precisely this purpose.

In regard to the right to do as one pleases with property. Suppose the farmers of the world should take a notion to withhold farm-products from the rest of mankind, the same as some private preserve owners are now withholding other things which are necessary for the welfare of mankind. What should be done in such case? This side of the question is submitted to the careful consideration of those who seem to think a man should be allowed to do just as he pleases with what he happens to own and pay taxes on. Possibly it may convince them that when it comes to the ownership of things which are necessary for the welfare of mankind it is unsafe to lay down the rule that a man may do as he pleases with what he owns.

It seems to me that common intelligence and com-

Nathaniel Wentworth arrived in town to-day for the purpose of arresting United States Senator Redfield Proctor, of Vermont. The commissioners at once proceeded to Corbin Park and there made the 'arrest and conviction of the Senator for shooting one raccoon last Sunday in said park.'

"Senator Proctor pleaded guilty and waived all examinations, thus preventing his being taken to Newport for a justice hearing. He was accordingly fined the full penalty in this case, \$10, which he paid, together with costs of \$17.50.

"Senator Proctor took the matter calmly, and did not make any complaint to the commissioners. There is a report hereabouts to the effect that a fish and game warden, or detective, visited Senator Proctor a few days ago, at his quarters in the park, and that the Senator expressed his willingness to pay for the fun he had had in shooting the 'coon. Some even go so far as to say that the Vermont man considered the incident closed after the warden's visit. It did not escape the notice of the commissioners, however, and Mr. Proctor was compelled to settle according to the methods of the law. This vicinity is being closely watched by the commissioners, and their action to-day shows that not even United States Senators can break the law without being brought to justice. The Senator is one of the directors of the Blue Mountain Forest Association, but that fact had no effect upon the proceedings of the commissioners."

Senator Proctor's side of the matter is told in an interview recently published in the Sun:

"That whole 'coon matter was wrong and unreasonable," said the Senator. "I didn't shoot the 'coon on Sunday and I wasn't arrested. The facts are that I was out in the woods with my little grandson on Saturday evening. He spotted a 'coon up in a tree and I drew a bead on the animal and brought it down.

"We carried it home and skinned it. The next day I discovered that the season on 'coons was closed, so I went to the authorities and paid a \$10 fine. I wasn't arrested and no demand was made for the fine. I paid for the 'coon on my own initiative and set an example for my neighbors to emulate. The talk that it was after midnight when I shot that 'coon is all bosh. If it had been, my grandson would not have seen it—and I'm sure I wouldn't have hit it."

Wisconsin Warden Active.

SEVERAL important seizures were made last week by Game Warden Valentine Raeth, of Milwaukee. Wednesday morning at 4 o'clock, Raeth found a barrel of fish on the train at the Milwaukee depot, which was marked "perch" and addressed to a fish dealer in Chicago. He opened the barrel and found just enough perch to cover the top of the barrel. The remainder were wall-eyed pike. According to the law, only twenty pounds of pike can be shipped out of the State once a week by the same party.

The next night the same warden found a box on the train from Green Bay which was addressed to Hartford, Wis. He opened the box and found that it was filled with red deer hides. Among the baggage at the baggage room in Milwaukee Raeth came across six pieces which had been checked from Ellendale, S. D., to Appleton, Wis. As Raeth knew this baggage came from a good prairie chicken country, and the laws of North Dakota do not allow the transportation of game out of the State, he searched the baggage and found a large telescope filled with prairie chickens.

He held the baggage and reported the matter to State Game Warden Overbeck, who sent Warden Gerhardt the next day with the baggage to Appleton. Gerhardt found that the baggage with the game belonged to State Senator T. A. Willy and his friend, Willis Babb, of Appleton, Wis., who were out in North Dakota on a hunting trip and had violated the laws of the State of North Dakota, Wisconsin and the United States law.

According to advices from Appleton, Gerhardt has applied for warrants for the arrest of Senator Willy and Mr. Babb. The game was confiscated.—Milwaukee Daily News.

Sportsmen's Pictures.

IN the beautiful art store of Mr. William Schaus, 204 Fifth avenue, New York, there is at present on exhibition a number of large pictures whose theme is of the fields and cover where quail abound, and nature dons her most beautiful garb of crimson, brown, green and gold. They are from the magic brush of Prof. Edm. H. Osthaus. Three or four are devoted to the portrayal of setters and pointer on spirited points, while one large picture is a portrayal of a large St. Bernard bitch, lying down, her litter of chubby, awkward puppies playing about her in true puppy happiness. Two horses, in the middle ground, stand on the thitherward side of a fence, idle and contemplative, the whole forming a beautiful picture. All alike have the warmth and beauty of color, beside the realistic portrayal peculiar to Prof. Osthaus' work.

The Adirondack Big Game.

LAST week we recorded the killing of some of the newly introduced Adirondack elk; now comes a story of the shooting of one of the recently imported moose. The killing is ascribed to natives, who are said to be opposed to the introduction of elk and moose, because of fear that these species will drive out the native deer. If such a feeling exists it is foolish. The moose and elk would not drive out the deer. The three live together in other regions. They would live together in the North Woods if the human wolves would only give them a fair chance. The ascription of these elk and moose killings to any such fear on the part of the Adirondack residents is less plausible than the simple one of finding a motive in the selfish, wanton and wicked craze to kill which takes possession of so many ill-balanced and coarse-fibered individuals when they turn themselves loose with a gun in the woods. If Chief Protector Pond runs down the perpetrator of this moose killing outrage, he will in all likelihood discover that wantonness and lust to kill, not fear as to the Adirondack deer supply, was at the bottom of it.

THE CREEK AT HIGHWATER.

Only a comparatively few ever have been or ever will be wealthy. The vast majority must always be people of small or moderate means. In whatever way the rich invest their wealth, except in land, the masses of the people participate in and are benefited by its use. Only when it is invested in land does it restrict their privileges and comforts. There is a growing sentiment that the land is for the people. The present laws of land ownership will be sacred just as long as the great majority permits them to be and no longer.

D. R. MARSHALL.

Editor Forest and Stream:

THE game preserve question has been given a very full and patient hearing in the columns of FOREST AND STREAM, and I have no desire to carry the discussion of the subject to a tiresome length.

But it seems that it is necessary for me to repeat for the benefit of Mr. William H. Avis that I have no objection to private preserves of the sort which he refers to in FOREST AND STREAM for Aug. 29. A careful reading of what I said on this point should have convinced him that it was unnecessary for him to submit that consolidated press report for my consideration.

This report was also submitted to show "That the rich man's preserve helps to stock the surrounding country with game." If I understand Mr. Avis he would have all of this "surrounding country" preserved, and it is not clear to me how, turning game out of one private preserve into another private preserve, is going to benefit the multitude, who are too poor or too conscientious to own preserves. I have no objection to this idea of preserving the whole earth, provided a just share of it is included in public preserves. But I believe it is just as important to preserve the God-given rights of mankind as it is to preserve game.

"Landowners doing as they please with land they own and pay taxes on." I would assure Mr. Avis that I have given this side of the question some thought, and have reached the following conclusion in regard to it:

We should place a very narrow limit on the amount of land which a person may own, and we should also place a limit on what a person may lawfully do with land.

At the rate things are now going it will soon be possible for a very few persons to own the whole earth. This would not be a very great calamity if we could be sure that they would always be the right kind of persons. But what would become of the rest of us poor mortals if they should ever happen to be the

mon sense should teach us that we are dependent creatures, that the injury or degradation of a person or class of persons is an injury to every other person or class of persons. Therefore, even if we are lacking in humanity, our self-interest should prompt us to recognize and guarantee to the most lowly their God-given rights, among which is the right to live and share in all that this world has to give, which elevates and ennobles mankind.

I have just returned from a trip to the Adirondacks, during which I took especial pains to get the opinions of guides and residents in regard to the recent disastrous forest fires, and I found their opinions are unanimous that these fires were of incendiary origin, the cause being a sense of wrong and injustice, which a large number of the residents are laboring under. The opinion is also unanimous that a halt will have to be called and something be done to allay this sense of wrong and injustice or the whole forest area, to use a common expression, "will be dressed in mourning."

W. E. Wolcott truly says, "The State is confronted by a condition, rather than theory, in this connection," and the problem is, how shall the condition be met? I like the tenor of Mr. Wolcott's article, and his excellent comments and suggestions leave but little for me to add.

We should remember that these people are well meaning, but ignorant to a large degree, of right and wrong, as defined by law, and have their own peculiar notions in regard to the correct way to redress a real or fancied wrong. They are amenable to reason, and would respond to any policy of conciliation. Clearly the State has nothing to gain, but everything to lose by an arbitrary ejection of these squatters. This is true, also, as to the private preserve owners. It sounds very brave to say, enforce the law, and possibly some may think it just the thing to sneer at sober and well-founded warnings as "yarns, which should be classed with the spooky fables of childhood." To such I submit for careful consideration the following proverb, which was uttered by the wisest of men:

"The prudent man foreseeth the evil and hideth himself, but the simple pass on and are punished."

Camping on the Manistee.—II.

Monday.

THIS Monday is a yesterday of the past in actions and deeds only. We who have known these yesterdays are a privileged lot; there are many incidents found there that re-occur to us as the months and years roll on, furnishing mental masterpieces that prohibit dull hours as well as aid the digestion; the sunshine is brighter for our having known such days; and our daily behavior in all things is made better by them.

Until noon on this day each hour furnished its sensations; always, however, sufficiently far apart not to wreck the nerves completely. Mr. Widdicomb entered the river above camp, and Mr. Lockwood at the camp, while I entered it a few bends below. Here the boat waited until Mr. Lockwood reached it; then he was carried past me, and behind us both came Mr. Widdicomb.

To the casual observer it would naturally appear that in this most generous arrangement of things, always directed by Mr. Widdicomb, he, in his distribution of his guests, had furnished himself with dry picking. I thought so, too. Mr. Lockwood insisted on balking, but was overruled and ordered into the river. It does not detract in the least from the spirit with which Mr. Widdicomb placed us for me to say that in his age of wisdom and his knowledge of men he was "on to us," as was seen when we came to one of those places of rest seemingly put there on purpose—a grassy spot surrounded by alders and soft maples; one of those little plots of ground that are half sunshine, half shade, where the wind does not blow; but the slight breezes meet. Here Sherwood was cooking the coffee as we came in one at a time. When Mr. Widdicomb arrived it was found that his creel contained as many trout as ours combined. The sage of the stream was "on to us," indeed.

To those who have eaten of this dinner in the woods, consisting of trout, bacon and fried potatoes, all out of one skillet; coffee, bread and butter and pickles, and a jar of cheese, I have nothing to offer except congratulations. But to those who have not, my advice is to go before the snow flies; then draw on the boat for a "poncho," spread it half in the shade, half in the sun, with your feet to the west, lie down with your pipe well filled and watch the light clouds form ruined castles and snowcapped mountains. In just one hour the sun in your face will wake you up, and it's only your surroundings that keep you from being sorry.

What we felt and saw and knew at that dinner by the river was repeated at supper, made different only by the change of time. Here long shadows were created by the camp-fire which made the heavens look black and the stars like yellow gems. It was shortly after that the candle on the box was blown out, good nights were said, and I began fishing all over again. I have often thought since that it was mean of my tent mates to envy me the pleasure my dreams gave me.

Tuesday proved so exact a repetition of Monday, with one exception, that it should be the basis of perpetual motion.

This exception to me is dear; to my friends even dearer. In their ever apparent desire that my trip should be a whole and wholesome success they hoped daily that I might catch a grayling. I, too, hoped that this might prove true; to take one of those pretty game fishes that will soon be but a vague memory was but a natural desire. It was in the afternoon that I came to a long sweep in the river where the foliage was scant by the edges, the bottom one bank of gravel, and the current swift. I was just a bit fatigued, and in making my casts I let my flies drift, and sink, following them down stream. In drawing for a fresh cast it occurred to me for an instant that my line was caught, but only for an instant. It tightened, then slackened, and then shot into view fifty feet down stream, a streak of silver—a grayling! The ensuing fight was a careful one; the responsibility of a steamship captain in a storm seemed no greater than I felt. I won, however, and thus handled the first grayling I had ever seen. It is needless to add that this fish has been carefully preserved; and, in addition to this specimen, Mr. Russell W. Woodward, of Elizabeth, N. J., has presented me with a reproduction of John L. Petrie's painting of the Montana grayling (*Thymallus signifer montanus*) as a souvenir of my luck.

V sitors.

It was on Wednesday that the river above camp was visited, and our collection of trout was nicely increased in numbers and size. It was on Wednesday that I cast by a red flower on the margin of the river again, and the trout that I had heard of for twenty-five years and looked for for the same amount of time, came forth and "did me" almost to the extent of tears. This monster struck from under the water and I struck at the same time; and it's a question in my mind which struck the hardest, or which received the greater shock. The fight didn't last long; the only thing I can liken that trout's actions to is the propeller of an ocean steamer as it leaves the water when the bow is down in a troubled sea; or a dog fight between two fox terriers. He never did stop fighting. I tried to "play him," but it was like playing line out to a dog having a fit. He didn't need line; he needed a club or an ax. When, however, I least expected it, he took line just as though it belonged to him. I tried to stop his rush, but couldn't. He made a dash directly under a stump and out the other side, then turned. I can feel that snap yet. I waded to the opposite bank and sat down and reeled in that listless line—sick, just sick. I'll not

publish even a part of what I thought. That trout was a buster.

As we approached camp that evening we were greatly surprised to see another tent pitched in our garden, another pair of horses browsing nearby, and another camp-fire burning as if to give us a double welcome. As our team came to a stop and Mr. Lockwood let himself down from the wagon (it wasn't just Mr. Lockwood's time of day for jumping), he was greeted by Mr. Geo. S. Fowler, of Washington, a gentleman he had known for many years. Mr. Fowler then presented Judge J. E. Williamson, of Evansville, Ind.; both Messrs. Lockwood and Widdicomb bade them welcome, while I emptied my waders, which, as usual, had been full since shortly after noon.

Judge Williamson.

Judge Williamson is a man just past the divide of life in years only; of medium height, jolly, rotund figure, smooth face and laughing blue eyes. These eyes are the visible seat of humor; from them shines a benevolence that speaks peace to the world. His corduroy suit and cap become him well. The vest was big at the arm holes,

WADING THE MANISTEE.

where the thumb rests while the Judge is telling a story. In voice his tones are as soft as the falling dew and as soothing as the bottle to the babe. His words are rounded and drawn as in Kentucky.

When Mr. Widdicomb presented me to the Judge, it was as the business manager of **FOREST AND STREAM**; from that moment I was the Judge's friend. He assured me that he "had enjoyed the dear old paper for thirty-three years," and when I reminded him of the fact that the thirtieth anniversary of **FOREST AND STREAM** was but a few days ago, his reply was thoroughly characteristic: "I wasn't thinking, Mr. Batten, of the years that the paper had been printed; I was thinking of the years I had enjoyed it. You are only recording the history of that nature that I have loved."

It was after all had had supper and an extra log was rolled up to our camp-fire to accommodate our guests that we fully discovered that Judge Williamson was taking a whole mental and physical vacation, and that body and mind were fully and healthily responsive to the

DUKE.

change. Our volumes of laughter rolled away into the darkness, creating peculiar echoes; the Judge unrolled his repertoire of stories, many of them incidents of his own interesting career; social and political phases of life were handled by a star performer, and there were no nightmares that night from indigestion. Even I failed to catch a trout in my sleep.

They Needed the Fish.

In a recent conversation with a gentleman he told me that during some of the years he had spent in the far West he had many times gone fishing when he needed the fish; it was a case of having to have them or go hungry. I didn't ask my friend his mode of catching them, believing, as I do, that honest necessity does not drive one to a law library.

It was probably three o'clock on this memorable Wednesday that Frank Taylor, who was fishing a tributary to the Manistee, thus mitigating the otherwise lonely hours at camp, came out to the river where just above him he saw a strange boat, and in it were two strangers. Not caring to disturb the gentleman that was doing the fishing, he crossed lots to camp. Later it was learned that this fisherman was Judge Williamson. In relating the occurrence to Mr. Widdicomb, who in turn told Mr. Lockwood and me, he described the judge as sitting amidships, with a fly-rod in one hand, casting his pretty at-

tractions here and there with a graceful sweep of his powerful arm; while in the other hand he held a short stout bait-rod, "plunking" for trout, while the sun and a double expectancy shone on his benevolent countenance, and the blue eyes sparkled with hope and anticipation.

It was probably nine o'clock the same night that I turned to Judge Williamson and asked him what he thought of a man who went "plunking" for trout. "Why, sir," said the Judge, "he ought to get six months during the trout fishing season."

"Well Judge, what do you think of a man who goes fly-fishing with one hand and plunking with the other?"

"Good heavens, Mr. Batten, did you see me?"

"No, Judge, but someone else did."

"Well," said the Judge, "it is a whole sight different when you need the fish; and I quite assure you we need them. However," he continued, "it is hardly necessary for me to remind you of the prettiest, and sweetest, and truest ethics of home, club and camp life, which, to my mind, is the sacredness of their secrets."

I quite concur in the Judge's opinion, and in deviating even to a limited degree from my own conception of that which seems true to tradition and real in fact, I am bearing always in mind the fact that they needed the fish.

When I bade Judge Williamson a regrettable adieu the next day, he led me by the arm in a most affectionate manner to one side of the camp, and, doubling up his soft red fist with a tension that turned it white, asked how I would like to meet that fist face to face.

I assured him that his story of his encounter with a newspaper man the night before had impressed me at the time as having a moral to it; and that I was glad our office had a side door, but that he might just as well ask me to annihilate that which grief and joy alike can call its own, dear Memory; as to ask me to forget that they needed the fish; even the palsied vein of humor in the dying must become active at the recollection of so rare and so real a sight of necessity's needs being catered to. Our whole admiration of Judge Williamson was best attested when Mr. Widdicomb placed his hand on the Judge's shoulder and said: "Judge, I'd like to camp with you some time." In this he spoke for us all. I, too, should like to supply the Judge with trout three times a day and reduce his labor to one rod.

Thursday.

This day is memorable to us as our last day in camp. Scenes and sensations were, however, unaltered: it was like the other days just as one stick of candy is like another, and ten sticks are better than one. This day was not without incidents, however, that were not on the daily programme. Duke smashed the monotony of camp life by turning deer hound, and he made three deer take to the hills while he gave tongue to the chase. Mr. Lockwood encountered an otter, and Mr. Widdicomb caught a mink. Accuracy in fly-casting made this alone possible; but the subsequent scrap with that mink undoubtedly at times made Mr. Widdicomb regret his prowess. In describing the contest he said "there were times I was tempted to anchor the varmint with rod, reel and all, while I got a club; she actually tried to climb my leader to get at me." He got the mink.

Breaking Camp.

There is too much sadness in breaking a camp of this sort to dwell on it. It was here that we men learned to know each other as we could not in any other walk in life; and in this case this knowledge brought no regrets, an exception, I fear, not the rule. I like to pass on here and take up life again in the office of Mr. John H. P. Hughtart in Grand Rapids, where I listened to his description of the trout Mrs. Hughtart and he had taken from the same waters while the care of a railroad fell from him with the ease of taking off a dusty coat. When later at the Peninsular Club I was presented to Col. Crofton Fox and had verified to the ounce Mr. Hughtart's catches, where Mr. Lockwood's many friends welcomed him back from the woods with remarks of his improved appearance; and later Mrs. Lockwood's dinner, where the delight was shown in his outing that proclaims a single purpose in life—life's rarest blessing; and the next day when Mrs. Widdicomb's hospitality and welcome made me forget a home a thousand miles away.

Leaving Grand Rapids was like breaking camp again, and I will pass on and out, only adding that the waistband of contentment is strained to the limit. The watermelon has been eaten.

T. E. BATTEN.

Potomac Anglers in the Muskokas.

WASHINGTON, D. C.—When we began our preparations for a trip to this famous region, naturally our first impulse was to cast about for such literature as would guide us to the fishing and suggest the tackle necessary.

The bookstalls and Congressional Library afforded little that we could find, and even the periodicals for a score of years yielded hardly anything of practical value.

Friends in New York and Toronto were written hurry calls for information, but in the end railroad folders were nearly all that could be found bearing on the subject, and these cover a territory rather than a lake, and their pictures are of record catches on lucky days, without telling how they were made.

Michie & Co., of Toronto, who furnish tourists with anything from a motor launch to a box of candy, were kind enough to write of the fishing, but we had not been explicit enough in telling of our destination, and their advice was principally of waters beyond our route. From their note, however, arose our first suspicion that the extravagant ideas we had entertained that all Canadian waters were alive with trout jumping for flies the livelong day might require modification. We found they did, and if this little screed will give some angler who expects to go up there healthier notions of actual conditions than we had, it will have served its purpose.

Our fishing on the Potomac has been almost entirely with surface lures, fly-spoon or bait-casting, and with the notoriously gamy fish of northern waters we hoped with our tackle to make new records of delight. We took fly-rods light and heavy, in lancewood, bethabara, and bamboo, and we took a-plenty, expecting to break them on the big fellows we were sure were waiting for us; with

these a split bamboo six-foot casting-rod of six and a half ounces, a beauty that was humiliated into doing duty as a trolling rod for maskallonge, with no better reward than several wall-eyed pike of six pounds and over.

Our assortment of flies we fondly thought fit to tempt the coyest fish are still undisturbed in the books; a couple of batteries already rigged were sufficient to persuade us that flies were comparatively useless in the waters we visited. There are no trout in that country and the bass feed deep.

We reached the foot of Muskoka Lake early in August in the gray dawn with a drizzle from the northeast to chill the marrow. Coffee is not understood at the only place open at that hour in Gravenhurst. We had left a hot wave in the south and here were mid-winter conditions for heat fag and open pores. We shivered under two or three fluffy blankets that night, but this only lasts a day or two. This Lake Muskoka, the largest of this group, is of the color of old cider vinegar. There are several sawmills about the foot of the lake, one of these burning its refuse in a cylindrical furnace, and it is assumed that none of them are permitted to dump in the lake, as the cottagers on the islands are subject to embarrassing restrictions in the matter of hygienic disposal of garbage. Many of the bays in the lower end of the lake are filled with saw logs rafted down from above and anchored with booms.

A few days later, in a visit to Bracebridge, up the Muskoka River, we found the source of the ugly color of Muskoka waters.

Here are located immense tanneries which pour a thick red liquor into the stream all day long, and the ground tanbark of the color of logwood is piled along the banks for roads and fillings, and its drainage is carried away to the lake.

Discoloration alone is not always fatal to fish, and water off the peat bogs in Scotland, eastern Canada, and other places, sometimes affords good fishing when of a shade 'twixt honey and Orleans. But the chemicals and tannin in this liquor of the tan mills poured down day after day with a cumulative effect that would in time ruin Lake Superior, has already lost for Muskoka its reputation among anglers—and must soon make its waters distasteful to its people for culinary purposes. Yet, judging by the course of events here at home, industries are not likely to be disturbed, even to the extent of asking them to take care of their own refuse, where the right to pollute public waters has become "vested."

At the head of Muskoka is a little rapid out of Lake Rosseau, and steamboats plying both lakes use a lock with about a three-foot lift; enough, let us hope, to save the waters of the upper lakes for some further while from the filthy tan refuse of Bracebridge. Our destination was a couple of little islands toward the upper end of Lake Rosseau, and our first morning we set out to hunt fish.

The most striking feature of these northern lakes to one accustomed to the warmer pools and streams of the south, is the absence of visible life in or about the clear, cold, healthy-looking waters (except Muskoka).

No fish break the surface; no turtles bask on the logs, though the snapper is occasionally taken with the hook; the harmless garter and water snakes are very rarely seen; no moss on the surface or in the depths; no lily-pads save dwarfed stragglers in the quiet shallow reaches of the short streams between the lakes.

The beds of these lakes are said to be the results of the infinite denuding forces of the glacial period, but it is impossible to fit a theory of currents that will account for the irregular cavities dug out to reputed depths of nearly two thousand feet; but the holes are there, filled with clear, cold water (except Muskoka), and the rocks are mostly bare and rounded by the great drift. The sides of shores and islands are usually steep, and the pitch continues so abruptly down beneath the waters that in places one may tie the bow of the boat to the shore and fish in forty feet of water at the stern.

Remarkably few insects were seen on the lakes, no vegetation pouring to the water's brim to harbor them; no mosquitoes, or practically none; no black flies; no midges. The only large winged insect, besides an occasional *Limulida*, was a black lace-wing larger than a May fly that was numerous and busy at early candle light. It was harmless and stupid, and had to be brushed out of the way at table or around the camp-fire. It covered the ridge-poles of the tents in the morning, but was never seen in the open by daylight, and probably had no part in the fish economy.

This big fellow was identified at the Agricultural Department as *Polystacothes punctatus*, a link related to the ant and aphid lions, and little is yet known of his class. Mr. Chittenden, of the Department, has taken them occasionally at Ithaca, N. Y., but they fairly swarmed under the hemlocks at Crane Lake.

Four specimens were brought loose in a pasteboard box and on opening it seven days later only one savage fellow remained, and he had eaten his three mates, leaving only the tiniest fragments of wings and chitine.

If these had been collected by an expert, chloroformed and stuck on a pin, science would not yet know that they are carnivorous and cannibals when in the perfect or winged state, though in the larval stage they are expected to be always hungry.

We saw no schools of minnows while away, and no minnow net save one we took with us and had no occasion to unlimber.

We tried earth worms about the upper end of Rosseau, and took some small bass and large yellow perch, fishing on the bottom at six or seven feet.

Off the Venetian group of islands, near Cleveland, and at points above the Royal Muskoka, we were told good bass fishing could be found, but we did not find it.

On the day before our arrival a 5-pound small-mouth black bass was said to have been taken in Indian River, just below Port Carlin, but this short river was very muddy from the operation of a little dredge for every day that we saw it.

We saw nothing but pan fish, as perch or sunfish, caught by any parties, and all with whom we talked spoke discouragingly of any prospects of fly-fishing. Some accounted for scarcity of fish on the theory that the wonderful popularity of the locality as a summer resort, with its hundreds of season residents and thousands of trippers, had exhausted the former plenty. On the other

hand, it was said that one cottager had a seine to be hauled in Lake Rosseau which could with difficulty be landed, containing, besides bass and salmon trout, immense quantities of so-called lake herring. His theory was that there was such an abundance of feed in the waters that the game fishes were never hungry.

Whatever may have been the reason, we found no fly-fishing; it may be only that we were in such complete ignorance of the life of these fish, and to know the fish is the biggest half of the art of angling.

From Lake Rosseau we took a launch, towing our boats and dunnage through Joseph River and Lake Joseph to the head of Portage Bay, paddling through a ditch into Portage Lake and camping at its head. About a shallow here we picked up a few small bass and sunfish with the fly, but nothing encouraging.

A sixteen-mile portage by wagon brought us to Jennings, at the head of Blackstone Lake, said to be 800 feet deep and full of maskallonge, wall-eyed pike and bass. This empties through Crane River, a narrow, shallow outlet into Crane Lake, the greatest fishing water in the Parry Sound District—and that is almost equivalent to anywhere—but there are no trout. Of our happy camp here under the birches and hemlocks it is enough to say the summer girl would call it a dream—and so it seems now.

The fishing is all that could be desired for a bob or bottom angler, but surface fishing is at a discount. For bait we had shipped from Toronto a thousand or more dew-worms, a great earth worm of six inches or longer, much like the marsh worm of the south, except they are lighter in color, inclined to be slimy, and not nearly so tough, but if one must use worms, these are of the best. With the worm bass are taken freely, though rarely of above a pound and a half, and rock bass and sunfish in plenty.

The first rock bass prepared for the pan disclosed the yellow muscle worms in the thick flesh of the back. He may have been the only one so afflicted in the lake, but investigation went no further. Fish were so plenty it was no sacrifice to let the rock bass go, and he is a wonderfully numerous individual here—pestiferous when you don't want him.

The worms for bait after the first day were principally used on No. 14 hooks to catch small fish, which are much better for large fish. The guide was able to take minnows, as they call all small fish, from the bow of the boat in four feet of water while we fished from the stern in twenty feet for the larger fish, and this he could do much faster than we could use them.

These fish, which made excellent bait, were ring perch or yellow-neds up to six inches in length, and also a variety of chub the guides called herring. At Rat Lake, a small bay of Blackstone, the guides went one morning and brought back several buckets of this chub—running to eight inches, quite dark above and silvery below; these proved a very killing bait that was difficult to keep in the buckets if at all crowded, but overboard or on hook or troll lived longer under rougher treatment than any we had ever used.

The wall-eyed pike took them nearly as freely dead as alive, and if one must fish with bait, the sport here is hard to beat. From our experience it is easy to believe that a boat could take a thousand pounds of fish here in a day.

In two hours, from five to seven in the afternoon, we took here with one boat, within a half mile of camp, above a hundred and fifty pounds of bass and yellow pike perch, not counting the small ones and rock bass returned to the water.

This would have been inexcusable but for a promise to the superintendent of a neighboring lumber camp to furnish the men a mess of fish. He had been kind to us in the matter of warm bread and even cake, and we were glad to reciprocate.

The bass were mostly small-mouth, though occasionally a large-mouthed bass was taken, and this gives opportunity to repeat that no man knoweth the difference between the two until he is landed—nor on the table until he is told.

The heaviest taken by our party was 3¼ pounds with the average of the keepers, but little above a pound. The wall-eyed pike or yellow pike perch—the jack salmon of the Susquehanna, and called pickerel through this region, to our confusion—is said to reach 14 pounds. Seven pounds was our limit; several were caught of six and over, and the average weight was nearly three pounds.

So plenty are they that four times in the two hours' fishing just mentioned, three rods were playing a fish each, and as two of them were light fly-rods debased to bait uses, it was much good fortune that kept us from disaster.

We found other points in the lake where these fish seemed as plenty, but we avoided them thereafter on the theory that they kept the bass away, though, when freely biting both were caught in the same places, and we really caught more bass with the pike-perch than where the bass were alone. We found a good many times places where the bass seemed very numerous, but after a little while they left.

The waters are clear, the boat's shadow, a menace, and the guides, though sure the fish could hear just as positive that noise in the boat or moving freely about, had no effect in driving them away. As a consequence, they were a little more careless and noisy than any we had ever seen, and remonstrance was useless. The very brightness of the water makes the greater caution necessary, and a dead easy angler might have been able to find them in shallower water than the average 15 feet, at which we found most of our fish.

To those intending to fish in Crane Lake, it is safe to promise more fish than you can use—more than any man has a right to take, but the fishing is not surface fishing—the fly, as far as we knew how to use it, useless—as was the spoon, except for trolling—and casting spoon or bait neither amusing nor profitable where the old trees, which do not decay, have been accumulating along the shores for a hundred years and worry the angler, who drifts or casts along the edge, and yet with the immense middle depths it is along the edge he must get his fish.

Our best success was in water 20 feet in depth, and

the better way to fish was with the sinker a foot or more below the bait and without a bob.

This is the experience of a fortnight. More skill or more knowledge may develop good fly-fishing there, but it seems to us improbable.

One of our party devoted himself principally to trolling for muscallonge, but without success, as were the efforts of a dozen other anglers on the lake in that period. The guides gave various reasons for this. One, that it was too late in the season—June and July being the best months. Another, that damming the outlet into Georgian Bay to secure a head of water for the loggers about the lake had raised the lake three feet above last year's stage of water. All these were very consoling at the time, and would be yet if a couple of days after his departure his host had not taken a 12-pounder.

A YARRUM IDLER.

Some Musings at Sand Lake, Mich.

I.—Spurious Writings About Angling and Nature.

It is astounding that so much counterfeit writing about sport and nature passes for super-excellent work. Some writers actually boast of their blindness to nature's beauty and grace, and secure admiration as "realists." Worse, other writers rhapsodize about that beauty in the language of the blind, while their own writing convicts them of not having visited the scenes they misdescribe.

For example, here is an extract from a much exploited poem by Kipling:

"Do you know the blackened timber? Dou you know that racing stream,

With the raw, right-angled log-jam at the end,
And the bar of sun-warmed shingle, where a man may bask and dream

To the click of shod canoe poles 'round the bend?"

It is there that we are going with our rods and reels and traces,
To a silent, smoky Indian that we know;

To a couch of new-pulled hemlock, with the starlight on our faces,
For the Red Gods call us out, and we must go."

The real log-jam consists of the mistruth and inexactness in this double quatrain.

Stripped of its rhythm-tinsel, that "poetry" is to true nature-love and insight, what a daubed chromo-picture is to a painting by Turner. By what poetic license can readers be supposed to "know" some unlocated "blackened timber," and "that racing stream?"

No actual log-jam is "raw," right-angled," or "at the end" of such a stream. It is a wonderful study of hues—browns, umbers, faint pinks and purples, and dull reds and yellows, silver of lichens and green and crimson of mosses. Not one canoe-pole in a thousand in either the United States, India (outside of army equipment), Norway, British Columbia, or any of the Maritime Provinces of Canada, is "shod," and when it is, it does not "click," and if it did, even its impact on rocks "round the bend" would not be heard along quiet water, much less in the tumult and uproar of "that racing stream." Thus the falsehood makes the whole word-picture an affront to correct taste. Any megaphone "word-artist" can fling a potful of language-paint at a canvas; but it is reserved for some Quack of Error to demand that the resulting rent and hole in the canvas, and the "spotteration" that surrounds and befouls it, shall pass current for a magnificent picture, "tender, grand, and true!"

It would be difficult to place more false description in a like number of words than that contained in those eight lines of "poetry." Its "art" is far inferior to the intentionally distorted and burlesque description, intended as ridicule of just such false work as this by Kipling, that appeared thirty years ago in a poem entitled "Caramel" (burned sugar), as follows:

"The scintillant zephyrs gleam;
The moon rides over the rack;
The lightning rods, with cream,
Comb their purple tresses back.
But down where the fir trees fume,
And the mermaids curl their teeth,
Rath corals glide in gloom,
And the red moon swords its sheath."

Finally, note the rough, bungling words, "It is there that we are going," in the above citation from Kipling, and the pompous conceit of the words, "Red Gods!" What a credit and honor he deems it that he is possessed of those crimson deities! What a triumph of absurdity to give such a name to the heart-longing, so natural, simple and beneficent, to be right with Nature.

The word "traces" is meaningless—an Anglicism that refers to a section of spinning tackle that is never used on "racing streams;" so "traces" is misused as a rhyme for "faces." An Indian is not "smoky," but dark-skinned. Real canoeists and anglers who are sportsmen would not "go" to the Indian, but to the stream. A "bar" is always a deposit of alluvium earth-sediment which has gathered and formed a mud bank or island. There never was a "bar" of "shingle," for that is very coarse gravel or small, water-worn stones to which the word "bar" cannot be correctly applied. (See Standard Dictionary for definitions of these words.) No sportsman would dream of sitting or reclining on such a hard, hot, uncomfortable seat as "sun-warmed shingle." "Bask and dream!" The real words should have been "bake and steam." Neither do campers sleep on a "couch" (bed) of hemlock twigs if they can get spruce boughs; and when they do, there is no "starlight on their faces." They "bask" in that as they smoke on some moss-covered log beside lake or stream.

In short, that rhyming is mere fakir vociferation, squawking of a brood-goose on addled eggs, self-conscious, mountebank strut and posing, brazen assumption by ignorance of real truth, insight, and knowledge, bawling claim to Nature-photography, vivid, "picturesque" word-painting and virile rhyme-gospel by a wonderful, "versatile" seer.

Such is the more offensive writing about sport and Nature. But note the other extreme, a demonstration that another writer is blind to Nature's charms; and far worse, note his boast that such blindness is admirable. A prominent sporting magazine contains in its current issue an article by a life-long and prominent fisher, in which he

quotes, with much approval, the following words from a letter to him by a noted American fish propagator:

"When I go a-fishing I go fishing. I don't hear the babble of the brook; I don't see the fluttering bird, nor the silvery leaves, nor the beautiful sky. * * * I am just as sure of a rise, too, as the fond mother is that the child will roll its loving eyes to her face with an expression that says to her, 'I am yours!'"

That letter showed its writer to be a mere fish-butcher. He is a murder-mother when he hooks and kills the fish that he feels and states is like a child that rolls its loving eyes to its mother's face. But the fish has no such thought, desire or expression. Instead of saying, "I am yours," that darting fish is saying "That fly is mine!" His eyes are fierce, fixed on the supposed insect; and they do not "roll."

Such arrant nonsense and drivel about Nature and sport too often find vogue in our best sporting papers. The game fishes, notably the bluefish, black bass and maskallonge, are not water-babies, but burly water-pirates, game to the core, and spoiling for a fight. He who angles for them with best results, the expert who really sees and hears and loves beauty of his environment while angling, is the truest sportsman. For he also well knows the haunts, habits and moods of the lurking trout, salmon, pike, pickerel and ouananiche. But shut away from him all capacity and wish to see, while angling, the blue glory and miracle of sky by day, or the silvery cloud-domes through which stars and moon are peeping as he casts "white-miller" flies at night; remove from his sight and heart all joy in the beauty and grace of water as it sings and talks to itself, and all music of leaves and birds, sigh of wind in pines and hemlocks, exquisite curvature of rushing streams, or oncoming, white-capped waves; take away all fresh, novel odors and hues of woods and wild flowers, and that sportsman will say: "I do not care to go a-fishing. Catch my fish for me with a silver hook, in a dark, malodorous corner of some fish-market. I shall not joint my rod if it cannot be a wand that not only helps me to catch fish, but also summons Nature enchantments as I cast flies, wade the brook, ride the waves in my careening canoe, listen, hear, love, and rejoice. Far less will I boast of my blindness, and leave it to be inferred that nature-lovers like Walton, VanDyke, Hallock, Jordan, Chambers, Rhead and Kent are not expert anglers. They are my fellow sportsmen, instead of the men who cannot see, hear, or feel—men who fish to kill, and make a business of angling, instead of a recreation. To proclaim such diseased pursuit a quest where fish "roll their loving eyes" up to the slayer's face as her own baby would to a mother, and then parade one's self as a model sportsman, is outrageous. And to place such degenerate stuff in the columns of a sporting magazine as stating something admirable and worthy of emulation, is being untrue to proper standards of sporting taste.

And he might add that it was also an affront to the expert anglers who not only have most skill, but most enjoyment in knowing where fish lurk, and how to hook and land them. For those real sportsmen revel in a myriad of delights other than the actual fights with their fish. They bring back a thousand raptures which they cannot show. They joy in the nameless charm and hypnotism of the camp, and its outdoor fire with its dancing flames and column of smoke; they note and love the sunshine, shadows and darkness, the fireflies, the delightful sense of remoteness and wildness, the hooting of owls, calling of whippoorwills, and the strange, weird laughter and yelling of unseen wildfowls concealed in reedy fastnesses. They are men who rejoice as they feel the leap and glide of the boat shooting the rapids, and watch the rainbow effects in mist and sunshine over the silvery water-breaks. And they sleep under sombre pines in a wilderness, inside a tent pitched on a carpet of brown pine needles, and say with gladness: "It is not all of fishing to fish!"

L. F. BROWN.

Santa Catalina.

AVALON, Santa Catalina Island, Cal., Aug. 27.—If the Tuna Club decides that the big jewfish caught by Mr. Edward Llewellyn yesterday was taken fair and that the gentleman is eligible to compete, the black sea bass record has again been broken. The fish taken Wednesday weighed 425 pounds and was brought to gaff in the short time of forty minutes. These figures show that the jewfish really falls far short as a game fish. Mr. Llewellyn's tackle came within the restrictions imposed by the Tuna Club's rules as to rod and line, but there may be some question as to his eligibility. According to the rules of the club those who are connected with the "allied industries" of the island are debarred from competition with sportsmen. This, of course, as it should do, cuts out the boatmen, who, however, are provided for by a special class. Mr. Llewellyn is a member of the Catalina Band, and for that reason some one has suggested the possibility of a protest against allowing the record. As the fish was taken fair, it would seem an injustice to deny the lucky man full honors. Perhaps Mr. Llewellyn may come in under the plea that playing in the marine band is not an industry; that he is exempt under the claim that his music is his art. I hope the record may be allowed. All the better for those of us who have hopes of breaking the record this or next season.

Another record has gone down and the event has been of considerable interest here. Boatman George Michaelis had a party out in his launch Thursday, and some one caught a yellowtail that weighed less than 2 pounds. Fortunately Michaelis recognized the value of the silvery beauty and handled him so skillfully and carefully that the baby yellowtail is now on exhibition in a tank of his own at the Avalon Aquarium. Manager Phelps reports him doing well. Previous to this season the smallest yellowtail taken here weighed 8 pounds. About a month ago one was taken which was estimated to weigh about 3 pounds.

There are no tuna being taken, and the sport is still confined to yellowtail and jewfish. The former are gamy enough, and if taken on fair tackle offer excellent sport. The more experience I have with them the more I admire them.

If the yellowtail would come out of the water on the strike and would make his furious rushes near the

surface and leap as the salmon does, he would be given a more euphonious name and would be hailed as the king of salt water game fish. Instead of this his rushes are made to a great depth, and though he is inclined at times to sulk, it requires but little to stir him up, and then one needs give him his head or expect something to go by the board.

I witnessed a battle between Mr. Lewis Crisler, of Los Angeles, and a yellowtail one morning last week. The sight never fails to interest me deeply, and on this occasion, as on many others, I rested and watched the fight. Mr. Crisler's tackle was rather lighter than that used on these waters, and that made things more interesting, and in addition to this he was handicapped by being in a light rowboat, where he had not the advantage of the angler in a launch, where he has the high freeboard and a chair to aid him. This particular yellowtail had a great reluctance to come in toward the boat, and all the line the angler gained was earned. In fact, few of the fish run toward the boat, and there is seldom any rapid reeling. Crisler's fish fought twenty-three minutes, and made over a dozen hard, long rushes, taking out a couple of hundred feet of line on several of his soundings. The sight of the boat seemed to drive the fish to a frenzy, and time and again he took out the line each time, to be lifted out of his sulk and reeled in inch by inch. We could see him down deep in the marvelously clear water and, to me, he looked much like a land-locked salmon, his movements were slower, but he had great power. We could watch him cruising back and forth down there thirty feet from the surface, yielding only an inch at a time, to the constant strain. I was astonished to learn that this yellowtail weighed but 18 pounds. Doubtless some of those who were fishing from the launches with hired tackle and a good, strong cross seat to hook the butt of the rod under; a reel with a ratchet lock and a chance for a two-arm lift, would have brought the fish in much less time, in to a point where the boatman takes the line and pulls him hand over hand for such fishermen, and gaffs him carelessly and throws him to the box in the bow. But that sort of men would never have been as content as was Mr. Crisler to call it "sport enough" and turn to the bass for an hour's pleasure with the lighter and more savory bass.

Some day the yellowtail will be valued at his full worth, and then anglers will find a limit placed on the number they may take in a day, since common decency seems to set no limit for a large number of people who come here for numerical and photographic records.

I was delighted to see FOREST AND STREAM reprint Mr. Charles Lummis' excellent editorial on Avalon fish destroyers. It has attracted much attention here. Epithets do not appeal to the man who kills fish for photographic purposes, but such articles as Mr. Lummis has written has started many people in California to thinking. Some day our salt water game fish will have some legal protection.

FRANK E. WOLFE.

Massachusetts Fish and Game.

BOSTON, September 19.—*Editor Forest and Stream:* The righteous work of punishing evil doers still goes on. One of the commissioners informs me that Mr. Viator, a Portuguese lobsterman, who has made his boasts that he would continue in the business he has followed for years of catching and marketing short lobsters in Massachusetts Bay, and that the officers could not catch him, has been brought to court for having in possession eighty-five "shorts."

This has been done by Warden Thayer, who runs the new launch, the Scater.

Other deputies in various parts of the State are making many prosecutions, and generally securing convictions. The New Hampshire Commissioners, too, are on the alert, and are not respecters of person in applying the law, having recently caused the arrest of no less a personage than Senator Proctor for illegal shooting of a 'coon in Blue Mountain Park. He paid his fine, of course, but is reported to have said he was ignorant of the law. That might be a palliation in case of an illiterate foreigner who is unable to read the English language, but if you or I were going out of our own State for game we should have with us a copy of the *Game Laws in Brief* and post up on the laws. Another case in Maine within a few days. A Boston lawyer (Mr. George W. Morse) and his two sons were prosecuted for killing deer out of season near the Katahdin Iron Works, and were convicted. This sort of game law enforcement by those in authority is worthy of the highest commendation.

Lobsters.

In view of the conference of commissioners from lobster producing States, and the Provinces, to be held on the 23d of this month in Boston, your readers may be interested to know that Prof. Field, of the Institute of Technology, who has been at Wood's Holl this summer, has advanced a theory that if dogfish could be got rid of it would be a great advantage in saving lobsters, and he has had dogfish served as food in several instances to persons who did not know what kind of fish they were eating, and as a result it has been declared excellent.

As your readers know, the Professor two years ago advanced a theory that the law should protect the mature lobsters rather than the small ones, and there are those who think he is right. Now, as a further safeguard, he would have the public eat dogfish. Never having eaten them, I have no opinion as to their edible qualities, neither am I able to judge as to what rank that species of fish takes among the various enemies that prey on the lobster, although I do know it to be a great pirate among the denizens of the ocean. But then, of course, there are many others, and I fear the public never can devour them all. What next? Well, as a sure thing, I am frank to say, I see nothing short of a close time, either for two or three months of each year or for several consecutive years. This would be a hardship for the time, not only upon those engaged in the business of catching or selling lobsters, but upon the consumers as well. But is it not a

choice between two evils, deprivation for a limited time on the one hand, or deprivation indefinitely (perhaps forever) on the other? The present law is said to be impossible of enforcement—certainly it is a very difficult one to enforce, while one providing a close season, thus shutting the markets for a time, could be easily enforced. We are awaiting with great interest the result of the interchange of views and the action taken at the conference of next Wednesday.

Reports from the sporting camps in Maine show that the trout and salmon fishing has continued good, and with cool weather promises to be even better for the balance of the month, and the law being off partridges, those birds afford sport and help out the menu. Among the many Massachusetts visitors to the Rangeleys are ex-Secretary and ex-Governor John D. Long and son, with Col. E. B. Haskell.

The matter of a fish-way on Rangeley stream, which has caused quite a stir among those specially interested, the commissioners say now rests with the people, and is not in any way complicated by the action of the board in establishing the hatchery.

By invitation of Adjutant-General Dalton, Governor Bates and staff have gone to the Commodore club house in Maine, leaving Boston on Thursday to celebrate the day following as the Governor's birthday. Mr. J. J. Raymond, the Washington street merchant, has just returned from a trip to the Megantic Preserve. Another member of the State Association, James H. Young, Esq., with Mr. Fred Guild, left this week for big game hunting in New Brunswick.

Dr. Heber Bishop, with several friends, left on Monday for the same Province. Others are going a little later.

To-day the Boston papers announced the engagement of Mr. Elery H. Clark, a Boston sportsman, known the country over as the champion American all-round amateur athlete and the star performer at the Olympian games in Greece in 1896. But all do not know that he is the son of the distinguished sportsman and philanthropist, Mr. Benjamin C. Clark, of Boston, who was for three years the honored president of the State Association.

CENTRAL.

Fish and Fishing.

Are Ouananiche Simply Sea Trout?

AN enthusiastic Scottish angler called to see me the other day on his return from a fishing excursion to the Grand Discharge of Lake St. John, and in the course of conversation about the excitement of ouananiche fishing, expressed his firm conviction that the so-called fresh water salmon of Lake St. John were not salmon of any kind, but simply sea trout. This is exactly the claim made for these fish by my good friend, Lieut.-Col. Andrew C. P. Haggard, D. S. O., several years ago, and repeated in his latest book, "Sporting Yarns Spun Off the Reel." In his charming introduction to "The Ouananiche and its Canadian Environment," the Colonel explains that it is chiefly upon the habits of the fish when hooked in the Lake St. John waters that he bases his opinion of the ouananiche being a salmon trout and not a salmon at all. The reasons given in the Colonel's new book for claiming the ouananiche to be a sea trout are no better than that already referred to. If habit alone could be considered a varietal distinction, into how many different varieties and even species might we not separate the people of any one nationality and origin? The Colonel describes the ouananiche as being exactly of the same appearance as the sea trout of Sutherlandshire, and referring to his fishing in the Gambo River of Newfoundland, he says: "If anything had been wanting to convince me that there is not the slightest connection between the ouananiche and the salmon, that the former is a mere salmon trout, and that those American and Canadian fish students who classify him as *Salmo salar* (ouananiche) are wrong, it would have been supplied by my catching the two fish together in the very same rapid on the Gambo, and by observing both their great difference of behavior and appearance when hooked. The ouananiche seemed more than ever like a salmon trout, one who had been a long time in the fresh water, and more than ever unlike a salmon when I had an opportunity, as now, of comparing several specimens of each on the grass side by side."

It does not appear to have occurred to Colonel Haggard that the differences which he notes in the appearance of the two fish are due to different habits, and that different habits do not constitute a different variety. The Colonel has returned to the subject in a recent letter to the London Field, and a new contributor to the discussion has arisen in the person of the well-known British authority, Mr. Fielding, in reply to whose curious contentions I may have something to say later.

Meanwhile, it will be interesting news to lovers of the fish, who have not been to Lake St. John this year, to learn that during the open season, which is now fast drawing to a close, the ouananiche have been more plentiful than in any previous year.

Another encouraging piece of intelligence in connection with the ouananiche waters, is that young salmon, whose capture in some of the streams near Lake St. John has been recorded during the last two seasons, have recently been taken in the River Aleck, which flows into the Peribonca, the largest feeder of Lake St. John, many miles from its mouth. This fact would seem to promise a very wide distribution in the near future for the newly introduced fish.

Trout fishermen are flocking here in large numbers from all parts of the United States and Canada for the fall fishing, and the sport, which has been poor during the months of July and August, is now at its best. The members of the Metabetchouan Fish and Game Club report fish more plentiful upon their preserve than for three years past. The Tourilli club has about seventy anglers and hunters upon its limits. Mr. R. H. Brown, of New Haven, president of the Nonantum Club, is now on his preserves at Lake Commissaire, with a party of friends, and Mr. A. W. Hooper, of Boston, who has lately returned from the club waters, took

several fish from four to five pounds each on the fly in Lake Commissaire. Mr. Hooper has now gone to the Ste. Marguerite to fish Mr. Walter Brackett's water for sea trout, for which it is noted. Friends of Messrs. Brackett and Hooper will be glad to learn that they enjoyed better salmon fishing this year on the Marguerite than Mr. Brackett has had for many years past.

Messrs. Geo. E. Hart, of Waterbury, and Burnham, of New York, are among the many anglers fishing the waters of the Triton Tract, on the line of the Quebec and Lake St. John Railway. The Upper Ouichouan River, in this district, is, as usual, yielding very large trout this September. Some have been brought thence to Quebec within the last few days which turned the scales at five pounds each.

Salmon and Worms.

The fact that so many salmon are captured every year with bait in the British Isles is certainly a very strong argument against the theory of those who hold with Dr. Francis Day, the late Frank Buckland and others that a salmon exists in fresh water on his own fat, which has been accumulated while feeding in salt water, and that it is simply in play or in anger that he arises to the fly. It will be remembered that Major Traherne in his book on "The Habits of the Salmon," published in 1889, declares emphatically that "there can be no question as to salmon feeding in fresh water, as they greedily take real and artificial spinning baits of all kinds, besides prawns and worms, to say nothing of flies, natural and artificial." All anglers accustomed to British salmon waters are well aware of the fact that these various baits are used in them for salmon with success. There is, however, no doubt at all, that it is a very rare circumstance to take *Salmo salar* on this side of the water with bait, though the very different salmons of the Pacific are constantly so killed. This fact lends additional interest to the contents of a letter which has recently reached me from Newfoundland. The writer, Mr. W. F. J. McCormick, of Biscayne Bay, Florida, well-known to readers of FOREST AND STREAM from his long and successful camping, hunting and angling excursions in the Canadian wilderness, writes, among other things, as follows: "One thing I have learned conclusively and positively, and that is that *Salmo salar*, the delicate aristocrat of the river, will stoop to 'bite' at the plebian worm, a piece of fish or common pork. I took a 12½-pound fresh-run fish on a bunch of worms, stood by and saw a 21-pounder killed with the same, and last Sunday I took an 8-pound grilse on pork! Does not that upset the pet theory of their refusing food while in fresh water? I can produce a number of sworn statements besides my own in support of this."

In England, as I have already said, nobody would be surprised at the above statement, but it is certainly very contrary to the general American experience.

The decadence of fly-fishing for salmon in some of the British waters has elicited a good deal of discussion lately, and some have not hesitated to lay it at the door of the bait-fishermen, contending that the constant bait-casting is responsible for the frequent refusal of the fish to rise to the fly. If there is any foundation for this contention, it is sincerely to be hoped that nobody will attempt bait-casting in Canadian salmon rivers. Some of the British bait-fishermen for salmon scout the idea that the casting of bait has anything to do with the failure of the fish to rise to flies, and a recent writer in the Field advances the very ingenious theory that in British seas a change is going on in the habits of the fish, perhaps, or possibly, in the diminution of the supply of that creature, whatever it may be, for which salmon mistake our gaudy flies. The correspondent in question also draws attention to the fact that in some rivers, particularly in British Columbia, salmon are never known to take a fly at all. This is not an apt illustration, however, for the salmon of British Columbia is an entirely different fish from the *Salmo salar* of Atlantic waters, whether found in the Old World or the New.

The salmon bait-fisherman naturally claims the same indulgence for his sport that is demanded when he employs similar methods for taking trout. He admits that the fondness for the fly-rod sticks to us, that the old love clings, but claims that though it is hard to lay a favorite old weapon down, even though useless, it is harder still to be denied a capture when another is at hand that will take its place.

E. T. D. CHAMBERS.

Habits of Some of the Catfishes.

BY WILLIAM CONVERSE KENDALL, ASSISTANT UNITED STATES FISH COMMISSION.

From the U. S. Fish Commission Bulletin.

THE fresh water catfishes of the United States of more or less commercial importance may be classified in a popular way as channel cats (*Ictalurus*), mud cats (*Ameiurus*), yellow cats (*Leptops*), and stone cats (*Noturus*). This arrangement is not wholly satisfactory, however, owing to the confusion of the common names, for a mud cat of one locality may be the yellow cat of another, and the yellow cat of some place be the stone cat in another locality, and so on. Then, too, there is no distinct line between channel cats and mud cats. The technical nomenclature and synonymy of these fishes are not in much better shape than the popular classification; therefore the discussion in the following pages will be more or less generic.

The catfishes are of such commercial value as food that there have arisen extensive and almost special fisheries for them in the South, the Mississippi Valley, and the Great Lakes region—that is to say, in the centers of their greatest abundance. Of about a dozen species appearing in the markets, probably not more than one-half are very common or merit more than passing notice. The largest are the "great forked-tail cat" of the Mississippi (*Ictalurus furcatus*), and the Great Lakes cat (*Ameiurus lacustris*). The first attains a weight of 150 pounds, the other perhaps 50 or more. Of the smaller cats the more important are the spotted cat (*Ictalurus punctatus*),

Potomac channel cat (*Ameiurus catus*), and bullhead (*Ameiurus nebulosus*).

There is very little published information on the habits of any species of catfish, and it has been thought that it might be of use to bring together the most important published and otherwise available facts on this subject. Owing to the similarity of habits, for this purpose it is unnecessary to refer to more than those of the most common forms except in a very general way.

The catfishes are a hardy race, very prolific, in habits and structure comparatively safe from enemies. For these reasons wherever they occur they are usually very abundant. In late years, however, the demand for these fish has reached such dimensions that in some localities extensive inroads have been made upon their numbers, and there has arisen the problem of how to repopulate the depleted waters. It has not, until recently at least, been considered necessary to resort to artificial propagation of catfishes, and there have been but few, if any, attempts in that direction. There are a few instances of pond culture which will be referred to in another place.

Food Qualities.—In flavor and other edible qualities the catfishes differ somewhat among themselves. As a rule the channel cats, especially the spotted cat (*Ictalurus punctatus* and *I. furcatus*), seem to possess more delectable qualities than the mud cats. This is possibly due to difference in habits and habitat.

Regarding *Ictalurus punctatus*, Jordan says (Bull. U. S. F. C., 1885, p. 34):

"As a food fish the channel cat is certainly better worthy of attention than any other American catfish. There is much less waste in the body of the channel cat than in other catfishes, as the latter lose more than half their weight by removal of the head, the entrails, and the skin. The flesh of the channel cat, when fresh, is very superior; it is white, crisp, and juicy, of excellent flavor, and not tough. It is much more delicate both in fiber and in flavor than that of the other catfishes. When well cooked, I consider it superior to that of the black bass, the wall-eye, the yellow perch, or any other percid fishes. Among other fresh water fishes, it is inferior only to the whitefish, the trout, and other *Salmonidae*."

The great popular demand testifies to the food virtues of the catfishes.

Habitat.—Almost any one of the species of catfishes seems to be adapted to a wide range of climatic conditions, although somewhat restricted to certain immediate surroundings. *Ameiurus lacustris* is supposed to be distributed from the Saskatchewan River and the Great Lakes to Florida. *Ameiurus nebulosus* is found from Maine to Florida; but in Maine this species occurs, as a rule, only in muddy lakes and streams with plenty of vegetation, and such portions of bodies of water of other character as afford those conditions, and apparently the fish do not stray far from home. Such localities are probably the warmest ones of the region. Regarding the local habitat of the bullhead (*Ameiurus nebulosus*), Dean says (Nineteenth Annual Report State Fish Commission, New York, 1890, 302):

"It is one of the hardiest of fishes, will care for itself, and even thrive in the muddiest of stagnant waters. It will breed readily, and will endure complacently every hardship of drought, extremes of temperature, and lack of food."

"Every trait of our catfish bespeaks its stagnant, mud-loving nature; dusky in color, sluggish, and blundering, furnished with long and tactile barbels, a shallow, slowly drained pond, furnished with an occasional deep mudhole, will suit admirably the needs of the fish. If the water does become warm in the summer, the catfish will survive—knowing how to survive is one of its especial virtues. In a 3-foot aquarium at college about a dozen 9-inch catfish were kept during very warm weather, the room temperature often in the nineties and the water changed but once a day, with but few fatal results. Should the air supply in the water fail, trust the fish to care for itself. It will come to the surface, leisurely renew the air in its swim-bladder, and even, frog-like or turtle-like, swallow air in bulk, trusting to stomach respiration. Of undoubted respiratory value, moreover, must be the scaleless, highly vascular skin, so important in the breathing economy of the frogs. Should the pond dry, and the whole pond basin be serried with mud cracks, the catfish will lie dormant for days, even for weeks. It has been found in a clod of mud, which served as a cocoon, until softened by the return of the water. In winter the catfish, like frogs, and unlike many of its neighbors, appears to hibernate. In November it becomes sluggish and refuses food, and early in December buries itself in the deepest ooze of the pond. It does not reappear till the first sharp thunderstorm in February or March. Then the fish are seen, thin and ravenous, approaching the shore so closely that their heads ripple the surface. So fearless are they in early spring in Central Park that they come in schools in shallow water and will take food almost from the hand."

The channel cats are so called owing to their apparent preference for channels of streams and clearer, cleaner water than that affected by the majority of so-called mud cats, though the native channel cats of the Potomac River, according to our present classification, is generically a mud cat (*Ameiurus*). In some southern rivers, the St. Johns, in particular, several species of catfish occur together with precisely the same kind of surroundings, whether muddy or sandy. The description of the method of fishing for catfishes in Atchafalaya River, Louisiana, given by Evermann (Report U. S. F. C., 1898, 290), indicates their habits sufficiently to warrant quoting from it under this head:

"The Atchafalaya River is in some respects a peculiar stream. It has its sources in Avoyelles and Point Coupee parishes, near where the Red River joins the Mississippi, and is at all seasons more or less connected with both of those rivers by a number of anastomosing channels and bayous. The Atchafalaya River is, in fact as well as historically, one of the mouths of the Mississippi River, and during the floods which come periodically to that region a vast amount of the surplus water of the Mississippi and Red rivers is carried to the Gulf by the Atchafalaya. * * * There are four species of commercial catfishes handled by the firms at Morgan City and Melville, viz.: The blue cat or poisson blue (*Ictalurus furcatus*), the yellow cat or goujon (*Leptops olivaris*),

the eel cat (*Ictalurus anguilla*), and the spotted cat (*Ictalurus punctatus*). * * * All river fishing during the fall and winter is done on the bottom, while all lake fishing is at the surface. During the spring, when the country is flooded, the fish betake themselves to the woods, and the fishing is then carried on chiefly along the edges of the float roads. The old tackle, which had been previously used in rivers and lakes, is now cut up into short lengths and tied as single lines, called brush lines, to the limbs of trees in such a way as to allow the single hooks to hang about six inches under the water. Each fisherman ties his lines to the trees along the edges of the float roads if he can find such territory not already preempted by someone else."

Food and Feeding Habits.—The catfishes are omnivorous, subsisting upon animal or vegetable food. In a strictly wild state the food is probably to a great extent animal, but they will eat almost any kind of vegetable matter fed to them in artificial inclosures. Writing of *Ameiurus nebulosus*, Dean (l. c.), says:

"The habits of the catfish make it a most objectionable neighbor. * * * The stomach contents show its destructiveness to fish eggs and to young fish. * * * It will eat incessantly day and night, prowling along the bottom with barbels widely spread. It will suddenly pause, sink headforemost in the mud for some unseen prey. Nor is it fastidious in its diet, 'from an angleworm to a piece of tin tomato can,' it bolts them all. From the contents of miscellaneous catfish stomachs, however, there appears to exist a general preference for fish food. Professor Goode has already noted the attractiveness of salt mackerel or herring bait. He has, moreover, hinted incidentally that the fish will not bite when an east wind is blowing. It is in order to procure food in a lazy and strategic way that the catfish has been seen to sink in the mud with but barbels and dusky forehead exposed, ready to rush out and swallow the unwary prey."

In their feeding habits all species of catfish seem to be more or less nocturnal. They take a hook most readily from about twilight on into the night. Most set-line fishing is carried on at night. Moonlit nights, however, are more favorable than dark ones. On the St. Johns River it was noticed that the fish would begin to rise shortly after sunset, in large numbers, and the sound of their "breaks" could be heard in all directions, although a lot of garbage thrown overboard would not fail to raise more or less of them during the day. The catfish here were wary of a baited hook, and although freely eating of pieces of bread or meat floating at the surface, if a hook or line were attached, it would never be touched. Yet a hook baited with meat or fish and sunk would usually be satisfactorily effective, especially if "bream" (*Lepomis*) began to bite first. The presence of other more readily biting fish seemed to attract the catfish and render them bolder. Large catfish would take a small baited "bream" hook much more quickly than they would a large hook. The mud cat here bit no more greedily than the channel cat. It might be well to state in this connection that the channel cats (*Ictalurus punctatus* and *Ictalurus furcatus*) are sufficiently game fighters to give an angler not too fastidious a very satisfactory battle. These two species might justly be classed as game fishes.

In northern lakes and streams the bullhead or hornpout does not always seem to be so wily as the southern catfishes were usually during the daytime. Although the best time to angle for hornpout is about dusk or after dark, they are not infrequently caught in the daytime, much to the annoyance of the "still fisher" for black bass, pickerel, and other fishes. When hornpouts begin to bite, if other fish are desired, it is necessary to seek another berth. They will take live fish or dead fish bait or frogs with equal readiness. If, however, hornpouts are wanted, angleworms are the best bait.

Spawn-Eating Habits.—Dean has referred to the fish-egg-eating propensity of *Ameiurus nebulosus*, and to show that this species is not alone in this ovivorous habit, it may be stated that on the Potomac River a seine haul was estimated to contain about 10,000 catfish (*Ameiurus catus* and *Ameiurus nebulosus*). A large number of these fish were opened and their stomach contents examined. They were found to have been feeding almost exclusively upon herring (*Pomolobus*) eggs, to such an extent that their stomachs were distended with the eggs. Mr. Harron, at whose fishery this observation was made, told the writer that although these large hauls were not frequent, occasionally much larger ones were made. In Albemarle Sound, during one shad season, the writer frequently found catfish full of shad roe, but catfish were not abundant at this time. It is obvious, then, that catfishes are very destructive to the eggs of other species. Dr. Hugh M. Smith says (Bull. U. S. F. C., 1895, p. 387):

"The catfish have a reputation among the California fishermen of being large consumers of fry and eggs of salmon, sturgeon, shad, and other fishes. This accords with their known habits in other waters. Mr. Alexander's examination, however, of the contents of several hundred stomachs of catfish in California and Oregon yielded only negative results as to the presence of young fish and ova. Writing of the bullhead in Clear Lake, California, Jordan and Gilbert say that it is extremely abundant and is destructive to the spawn of other species. The scarcity of the valuable Sacramento perch in that lake, which they attribute to the carp, here as in the Sacramento River, may be partly due to the more numerous catfish, which feed almost exclusively on animal matter."

Breeding Habits.—Probably less is actually known of the breeding habits of most of the species of catfishes than of their other habits, yet observations have been made upon two or more species with sufficient detail to warrant the assumption that in the main the habits of most species are essentially alike. Speaking of *Ictalurus punctatus*, Jordan says that it spawns in the spring, but that its breeding habits have not been studied. Mr. Jones says this species spawns when one year old, and twice a year—in May and in September. In the preceding spring he procured eight wild ones. After feeding them well up to this time (October 31), they had spawned in May and September and filled his pond. He says that they take care of their own young and trouble no other fish.

Introduction Into Other Waters.—Several species of catfish have been successfully introduced into new waters

in the United States, and attempts have been made to provide some European waters with American catfish with uncertain results, however. A detailed account of the results of the attempts to acclimatize catfishes in the Pacific States may be found in the Bulletin of the U. S. Fish Commission for 1895, 379. The catfishes handled were *Ameiurus nebulosus*, *Ameiurus catus*, and *Ictalurus punctatus*. In California the catfishes have become very abundant and widely distributed. In the lower Columbia and Willamette rivers they are also very numerous. In 1884 ten individuals, presumably *Ameiurus catus* or *nebulosus*, were transferred from the Potomac to the Colorado River in Arizona (Bull. U. S. F. C., 1884, 212). The shipment consisted at first of 100, only ten of which survived the journey. Their status in those waters at the present time is unknown. Some spotted cats (*Ictalurus punctatus*) have been placed in the Potomac, of which species one or two now and then make their appearance in the catches of the fishermen.

A number of years ago, at different times, small consignments of *Ameiurus nebulosus* were sent to Europe. They survived transportation very well and the last accessible records show that they continued to do well after reaching their destinations. What the ultimate results have been the writer has been unable to ascertain.

Catfish are preeminently a poor man's fish. They not only afford him a cheap food-fish, but become so abundant in time and there is so much demand for them that they afford a paying industry, notwithstanding their cheapness. They may be raised in artificial ponds or in ponds unsuited to other fish. They propagate rapidly and prolifically, and grow fast. Therefore there can be no objection to the introduction of them into waters unsuited to other fishes or in which other fishes do not occur, provided there is no danger of escape into waters where they would prove an undesirable acquisition owing to the objectionable characters already enumerated. The past attempts to introduce them into European waters, from the records cited, would seem hardly extensive enough to prove their adaptability or unsuitability to those waters.

Rainbow Trout in Missouri.

ST. LOUIS, September 17.—*Editor Forest and Stream:* We are in receipt of following letter from Mr. Edward A. Smith, Vice-President Missouri Safe Deposit Company, St. Louis, relative to California rainbow trout which were planted last fall in the Black River on line of Iron Mountain Route:

"While down on the Black River this summer we saw a number of the rainbow trout put in the Spring Branch last fall; we found that they have grown considerably and seem to be thriving.

"The fish expert who went with the car said that this Spring Branch was one of the best places for planting rainbow trout that he had ever seen.

"I hope, now that the good work has been started, that you will keep it up and get the Government to plant a fresh supply each year, so that ultimately we will have fine trout fishing in the Black River.

"If I can be of any assistance in the matter, command me."

I believe this a matter of interest to your readers, and therefore advise you of it. H. C. TOWNSEND.

Behavior of a Foxhound

NEW YORK, Sept. 5.—*Editor Forest and Stream:* Some time in the early part of last month I thought that I would have a fox hunt on a small scale. Not to disturb the quail with their young broods, instead of taking the whole pack, I took one dog only, an old hound, good for a three hours' chase any day. To my knowledge a dozen foxes have been killed ahead of him.

I started at 4 o'clock in the morning, with lots of dew on the ground. I loosed the hound in an old clearing of about eighty acres, an old grass lot with a buckwheat patch in the center. In the spring of this year I had noticed ten old quail in this same lot, and this is the reason I took only one hound, not to disturb

the quail. At the edge of the buckwheat patch, the hound took a trail, and within five minutes he started his game at full cry. The dog ran for five minutes and then stopped; although there was no reason for it, the ground being wet and damp with the morning dew. As soon as the dog stopped, I walked toward the spot where I had last heard him, to try and help him out. It was something unusual for the hound to stop, therefore I went to investigate. The underbrush was thick, intermingled with cedar trees and chestnut sprouts. All of a sudden and within twenty yards of me, I heard the barking of a fox, and at the same time the hound came up to me, and as I said above, within twenty yards of where the fox was barking, although he could not be seen on account of the underbrush. I coaxed the dog, and encouraged him by talking to him, but he would not leave my heels. I was disgusted, and if I had not known the dog to be a good foxhound, I would have killed him right there and then.

Two weeks later I started for this same locality, but took another dog along, that is to say I took two dogs. I was in a wagon, with two friends. After we reached the spot where we intended to go, the dogs started another fox and carried him off out of hearing. We waited for over three hours, and finally one of the dogs came back, the same one I had had with me two weeks before. Then we drove toward the vicinity where I had been two weeks previously.

We were driving along a regular country road, but in the middle of the woods. For a half mile it was a straight road, we could see a quarter of a mile behind us and as far ahead of us. All at once the dog started at full cry, ran 200 yards, then stopped. I said to my friends, "This is a fox," when the dog stopped. We stopped the horse, looked up and down the road, and listened. All at once I heard the barking of a fox, the same barking I had heard two weeks previously. There was no mistake about it, I recognized it, and I drew my friends' attention to it. Nearer and nearer this barking came. It came toward the road where the team was standing with three of us in the wagon. Suddenly one of my friends in the wagon with me, an old fox hunter, a man over seventy years old, looked over his shoulders toward the direction where the barking was, and said to me, "Hallo, Mr. W., there come the two dogs. Sport (the other hound) has found us." With that I turned my head, and looked back, but instead of seeing two dogs, I saw one dog, and one fox about twenty-five yards behind the dog and chasing the dog for all he was worth. Within ten yards, in the middle of the road, in plain sight of the horse, the wagon and the three of us, the dog stopped very unconcerned, and wagged his tail. The fox ran about five yards closer, within five yards of the dog, and also stopped, and looked at us. I grabbed the gun and killed the fox, which dropped dead in his track and never moved. At the report of the gun the dog looked around and saw the fox lying within five yards of him; then walked away. He would not look at it. We went to the dead fox, and it proved to be a young male fox, fully grown.

G. WALTER.

Brunswick Fur Club.

THE Brunswick Fur Club, of which Mr. Bradford S. Turpin is secretary, has issued circular letters containing full information concerning the conditions governing its field trials, and first annual hound show, on Barre Green, Mass., Oct. 12. Following is some information presented in said letters:

In order to make the trials of 1903 as interesting as possible, and to bring together not only the hounds owned by the members and those interested in fox hounds about New England and the Middle States, the club this year has by aid of a fund subscribed to by Randolph Crompton, O. F. Joslin, Harry W. Smith and others been able to ask three celebrated fox hound breeders of the Central, Southern and Middle States to come as its guests for the trials, bringing on the choicest representatives of their breeding that they may own or obtain, for entry in the Derby and All-Age stake.

L. H. Walker, of Hammack, Ky., the well-known breeder of the Walker hounds, has signified his intention of being present; John C. Bentley, of Sandy Springs, Md., has accepted the club's invitation, and Major S. A. Crump, of Macon, Ga., who owns a most representative pack of July hounds, has also advised the master of fox hounds that he will be present.

Judges: Bradford S. Turpin, George B. Appleby, C. J. Prouty, D'Orsay Williams, F. B. Whidden, F. W. Okie, James M. Appleton.

The Derby will be run the first day of the meeting, Monday, Oct. 12. The winner of the Derby holds the R. D. Perry Cup for one year, and wins outright one of the club cups.

The All-Age stake is open to all fox hounds and is started on Tuesday, Oct. 13. It is divided into five classes, as per "Field Trial Rules." The winner of each class receives a club cup, and the hound making the highest general average in all classes is adjudged the winner of the All-Age stake, and holds for one year the Hitchcock Challenge Cup and the Woodstock Kennel Cup. The latter cup will become the property of anyone having won it twice; the wins need not be successive, nor made with the same entry.

The Pope Memorial Cup is held for one year by the hound showing the best combination of trailing, speed and driving.

By the vote of the club, an owner may make one entry in the Derby or four in the All-Age stake.

The Derby shall be open to all fox hounds whelped on or after Jan. 1 of the year preceding the trials. The hounds shall be judged on average all-round work.

The All-Age shall be open to all fox hounds. There shall be five classes:

Hunting—By hunting shall be understood the general ranging and starting qualities of a hound.

Trailing—Trailing shall be considered the manner in which a hound follows a trail before a fox is jumped.

Speed and Driving—Speed and driving shall be considered rapidity of movement while actually carrying the scent, and therefore the hound doing the greater

part of the leading and known to be carrying either the ground or body scent, is the speediest.

Endurance—By endurance is meant the capacity of a hound for continuous maximum work during a number of successive days' trial.

Tonguing—By tonguing is meant the use a hound makes of his voice after he is let loose for the day's trials.

The fox hound having the highest general average shall be adjudged the winner of the All-Age stake, and in computing the highest general average, the first prize in any class of the All-Age stake shall count 50, the second 30 and the third prize 20.

Westminster Kennel Club.

HEMPSTEAD, L. I., Sept. 19.—Will you kindly announce in the next issue of FOREST AND STREAM that the Westminster Kennel Club's twenty-eighth annual dog show will be held in Madison Square Garden, New York, on the 10th, 11th, 12th and 13th of February, 1904.

JAS. MORTIMER,
Secretary and Supt.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

SEPTEMBER.

26. Riverside, Y. R. A. of L. I. Sound, fall regatta.
26. Seawanhaka Corinthian, club, Oyster Bay.
26. Chicago, handicap, Lake Michigan.
27. Williamsburg, open, fall regatta.

OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.
3. Columbia, special, Lake Michigan.
5. Southern, fall, New Orleans.
10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.

Second prize, \$50.00.

Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

Indian Harbor Y. C.

GREENWICH, LONG ISLAND SOUND,
Saturday, September 19.

The special race for steam yachts given by the Indian Harbor Y. C. for the one thousand dollar cup offered by Commodore Frank Tilford took place on Saturday, September 19. The conditions governing the contest required that yachts competing for the cup should not be over 700 tons gross, and that they should not be over 150ft. or under 100ft. waterline length. Before the race Commodore Tilford stated that should his yacht win the race the cup would go to the club as a challenge trophy.

The race was started at one o'clock, and there was no time allowance. The course was from the red spar buoy off the western end of Great Captain Island E. ½ N. to the spar buoy at the N. end of the Middle Ground, one mile N. of Stratford Shoal Light, and return, a distance of fifty nautical miles.

Only three boats came to the starting line, Norman, Commodore Frank Tilford; Inga, Mr. Charles H. Matthessen, and Seminole, Mr. John N. Robbins.

The steam yacht Oneida had on board the Regatta Committee, which was made up of Frank Bowne Jones, chairman; Charles E. Simms, and Charles F. Kirby.

The preparatory signal was given at ten minutes of one, and at one o'clock the starting signal was heard. The boats were given five minutes in which to cross. Seminole was first away, and she was timed at 1:01:32; Norman was next, and she crossed at 1:01:45; Inga was the last over, and her time was 1:02:12. Seminole was the

favorite, and it was thought likely she would lead all over the course. As it turned out, she was the last boat to finish, but her poor performance was due to an accident. It seems that just after crossing the starting line her damper got jammed when it was closed and could not be opened again. The steam dropped from 250 to 90 pounds pressure. Some time elapsed before the steam could be increased, and the better part of the race she steamed under 175 pounds.

Ten minutes after the start Norman passed Seminole, and soon after Inga worked into second place. The outer mark was turned as follows:

	Turn.	Elapsed.
Norman	2 31 00	1 31 00
Inga	2 34 10	1 34 10
Seminole	2 39 00	1 39 00

Norman increased her lead on the run back to the finish line, and Seminole about held Inga. The summary follows:

	Start.	Finish.	Elapsed.
Norman	1 01 45	4 03 14	3 01 29
Inga	1 02 12	4 15 21	3 13 09
Seminole	1 01 32	4 19 09	3 17 37

Norman beat Inga 11m. 40s., and Seminole 16m. 8s. Inga beat Seminole 4m. 28s.

Norman averaged 16.53 knots, Inga 15.53 knots, and Seminole 15.18 knots.

Norman, ex-Oneonta, was designed by Messrs. Gardiner & Cox, and built by the Delaware River Works, Chester, Pa., in 1895. She is 130ft. waterline, 163ft. over all, 18.4ft. breadth, and 7.5ft. draft. Her gross tonnage is 135, and net 92. The engines are of the triple expansion type, with high pressure cylinder of 13in., intermediate of 21¾in., and low pressure of 35in. by 16in. stroke. The boiler is of the Seabury water tube pattern, having 60 square feet of grate surface and 230.89ft. of heating surface. The engines are of about 1,000 horse-power. Soft coal was used in the race.

Inga, ex-Irene, was designed and built by the Gas Engine and Power Company and Charles L. Seabury Company, at Morris Heights, in 1901. She is 130ft. waterline, 155ft. over all, 18ft. breadth, and 7.5ft. draft. Her gross tonnage is 166, and net 113. She has two triple expansion engines, whose cylinders are each 8½in., 14in., and 23in., by 12in. stroke. She has twin screws. Her engines are of 800 horse-power. Hard coal was used in the race.

Seminole, ex-Hanoli, was designed by Mr. Henry J. Gielow and built by the John N. Robbins Company, Brooklyn, in 1902. She is 122.8ft. waterline, 147.4ft. over all, 17.6ft. breadth, and 6.8ft. draft. Her gross tonnage is 147, and net 100. Her engines are of the inverted triple expansion type, with four cylinders, 12in., 18in., 20in., and 20in. in diameter by 15in. stroke. Her boilers are the Almy type, and have 63 square feet of grate surface. Her engines are of 800 horse-power. Hard coal was used in the contest.

Bergen Beach Y. C.

JAMAICA BAY, LONG ISLAND,
Sunday, September 13.

The last of the circuit races of the Y. R. A. of Jamaica Bay was sailed on Sunday, September 13, under the auspices of the Bergen Beach Y. C. The day was a perfect one for yacht racing, and it was disappointing that there were not more starters. At the time of the start there was a fresh S. breeze blowing, and it increased steadily up to the time the boats finished, when they had all they could swing to.

The course was from an imaginary line drawn from the club dock and a stake boat anchored 100 yards off shore; thence to a stake boat off Carnarsie Landing; thence through the Canarsie breakwater to Main Channel; thence to red spar buoy; thence to the starting line, and sailed over twice. This made the first leg a run, the second a reach, the third a beat to windward, and the fourth a reach.

The owners of Vision and Amareth protested each other, and both boats were disqualified. The course was badly laid out, several of the boats being unable to cross the finish line owing to the shallowness of the water. The summary:

	Start.	Finish.	Elapsed.	Corrected.
Yank	1 21 03	2 45 38	1 23 25	1 23 25
Marion	1 21 23	3 40 35	1 19 02	1 18 34
Baby Roger	1 20 51	2 43 03	1 22 17	1 19 17

	Start.	Finish.	Elapsed.	Corrected.
Ariel	1 25 32	2 42 25	1 16 53	1 16 53
Irene	1 26 45	Did not finish.		

	Start.	Finish.	Elapsed.	Corrected.
Aurora	1 30 47	2 46 02	1 15 15	1 15 15

	Start.	Finish.	Elapsed.	Corrected.
Pluck	1 36 00	3 02 20	Not measured.	
Doctor	1 35 43	2 57 46	1 22 03	1 18 47
Amaranth	1 35 46	2 58 55	Disqualified.	
Vision	1 36 03	2 54 44	Disqualified.	

	Start.	Finish.	Elapsed.	Corrected.
Free	1 40 36	Did not finish.		
Alert	1 40 19	3 03 50	1 23 31	1 23 31
Reliance	1 40 35	3 11 00	1 30 25	1 30 25
Charlie D.	1 40 43	3 09 52	1 29 09	1 28 59
Lester	1 40 46	3 04 58	1 24 12	1 23 12
Wild Duck	1 40 31	3 07 10	1 26 39	1 24 26

	Start.	Finish.	Elapsed.	Corrected.
Gracie	1 45 26	2 52 29	1 07 03	1 07 03
Lottie M.	1 45 25	2 50 32	1 05 07	1 05 07

The winners were Marion, Ariel, Doctor, Lester, Aurora and Lottie M.

Bristol Y. C.

BRISTOL, RHODE ISLAND,
Saturday, September 5.

Thirty-two boats started in the fall regatta of the Bristol Y. C. which was sailed on Saturday, September 5. The race was spoiled by a nasty squall which broke when the boats were near the finish. Several of the boats had very trying experiences, and the catboat Wanderer was dismasted, and Cayenne capsized. San Toy gave up and was towed into the harbor. The summary:

DIVISION ONE.

	Start.	Finish.	Elapsed.	Corrected.
Lady Mary, Richard Aldrich.....	1 50 25	2 50 25	1 50 25	1 50 25

Newport Y. C.

NEWPORT, RHODE ISLAND,
Saturday, September 12.

The Newport Y. C. held its fall regatta on Saturday, September 12. Sixteen boats started, and all but one finished. A light S. breeze held throughout the contest. The course was from an imaginary line from the judges' boat to the flagstaff on the Torpedo Station, to and around St. Patrick's buoy, around both Bishop buoys, thence to and around the North Dumbells, to and around the dolphin at the south of the Torpedo Station, back to the starting line.

The judges were Messrs. John G. Costello, J. Allen Boone, and John Alfred Allen. The summary follows:

	Start.	Finish.	Elapsed.	Corrected.
Skraeling, Willoughby	4 17 30	5 17 30	1 17 30	1 17 30
O. Denniston	4 21 15	5 21 15	1 21 15	1 21 15

The winners were Skraeling, Minnow, Conqueror, Nassau, and Vesper.

Newport Special Thirties.

The season with the Newport 30-footers, which closed on Thursday, September 10, has been a good one in spite of the fact that fewer boats have been in commission than any season since the class was built. Five boats have taken part in the races, Carolina, owned by Pembroke Jones; Barbara, Winthrop Rutherford; Vaquero III, Payne Whitney; Raccoon, John R. Drexel, and Breeze, William G. Roelker, Jr.

The season's record for the boats is as follows:

	Starts.	First.	Seconds.	Thir.	S'son Cup
Carolina	44	24	4	0	18
Barbara	44	10	13	1	6
Vaquero III.	41	8	7	1	7
Raccoon	32	2	6	3	2
Breeze	13	1	2	4	1

During the season, from July 1 to September 10, there have been forty-five races, nine of which have been for cups. Of this number, Carolina and Barbara have been in forty-four races. Carolina has won twenty-four races and has taken six cups, including the season's championship cup. This is the third year in succession that Carolina has proved the champion of the class. Last season she won the Paget cup, which to own outright a boat had to win two seasons in succession. This spring Mr. Jones offered a cup for the boat making the best average for the season, only firsts to count, and it was necessary for four boats to start for a win to count. Although Mr. Jones was not particular about winning his own cup, he did so with ease.

During the season, beside the Jones cup, Carolina won the following cups: The Rutherford cup, the Whitney cup, the Norrie cup, the Commodore Bourne cup, and the cup offered by the Rhode Island Y. C. and sailed for at Potter's Cove. One other cup rightfully belonged to the Carolina, one offered by Mr. Jones himself, but he made the condition that if the Carolina finished first the cup was to go to the second boat, and it was presented to Vaquero III. Vaquero III. also won the cup offered by the New York Y. C., Barbara won the Walters cup, and Breeze the Drexel cup.

Carolina has again this year been in command of Capt. "Sam" Seaman, who is termed the "king of small boat skippers," a man who knows everything about small boats, and who had an able crew at his command. Last year Mr. Jones presented Capt. "Sam" with a loving cup in recognition of his services. Captain Seaman is one of the best known of the Cow Bay skippers, and his home is at Port Washington, Long Island.

Larchmont Y. C.

LARCHMONT, LONG ISLAND SOUND,
Saturday, September 19.

The fall regatta of the Larchmont Y. C. was sailed on Saturday, September 19, and the event was marked by a very small list of entries. The schooner race for the Larchmont cup was scheduled for this day, but there were no starters. The largest boats that came to the line were the 60-footers Neola and Weetamoe. None of the 43-footers put in an appearance, and class N was the next largest to fill. There were six starters in the raceabout class, and three of the Larchmont 21-footers were on hand. This race practically winds up the racing on Long Island Sound, and ends a season that has been most unsatisfactory and disappointing from the standpoint of the racing yachtsmen.

The day was a fairly good one for yacht racing. The breeze was light from the E., and at the start had a strength of six or seven knots. The 60-footers were to have covered the triangular course of 10½ miles three times, but as the wind fell light at the end of the first round the Regatta Committee decided not to send them around again.

The preparatory signal was given at noon, and the 60-footers were sent away ten minutes later. Both boats were carrying large club topsails. Neola crossed in the lead, but Weetamoe was nicely berthed on her weather quarter. The first leg was a beat and Neola was rapped off and allowed to foot while Weetamoe was pinched out. Before reaching the weather mark Weetamoe had secured a nice lead, and from that time on she had the race well in hand.

In class H Mimosa had only Little Peter to beat, and this she did with ease. The other 30-footers were racing at the Atlantic Y. C.

The raceabouts got away well bunched, with Rascal slightly in the lead. Rascal and Jolly Tar sailed a pretty race for first place, but the former won out by exactly 1m.

Dorothy had the best of the start in the Larchmont 21ft. class, but Hourie, cleverly handled, managed to work into first place and beat out Dorothy, the second boat, by over 2m. The summary follows:

	Start.	Finish.	Elapsed.
Weetamoe, H. F. Lippitt.....	3 24 31	3 24 31	3 14 31
Neola, George M. Pynchon.....	3 30 18	3 30 18	3 20 18

	Start.	Finish.	Elapsed.
Mimosa, T. L. Park.....	3 06 19	3 06 19	2 46 19
Little Peter, F. M. Weeks.....	3 22 51	3 22 51	3 02 51

	Start.	Finish.	Elapsed.
Cricket, Howard Willets.....	3 22 30	3 22 30	2 57 30
Grasshopper, H. C. Fryer.....	3 20 07	3 20 07	2 55 07
Rascal, S. C. Hopkins.....	3 10 43	3 10 43	2 45 43
Jolly Tar, Slocum Howland.....	3 11 43	3 11 43	2 46 43
The Kid, Oliver Harriman, Jr.....	Did not finish.		
Hobo, T. L. Parks.....	3 13 15	3 13 15	2 48 15

	Start.	Finish.	Elapsed.
Dorothy, L. G. Spence.....	3 36 24	3 36 24	3 06 24
Vaquero, J. N. Marble.....	3 54 30	3 54 30	2 24 30
Hourie, J. H. Esser.....	3 34 10	3 34 10	3 04 10

The winners were Weetamoe, Mimosa, Rascal and Hourie.

Bensonhurst Y. C.

BENSONHURST, L. I.,
Saturday, September 19.

The eighth and last regatta of the Y. R. A. of Gravesend Bay was held on the afternoon of Saturday, September 19, under the auspices of the Bensonhurst Y. C. Ten boats started and finished the race. The entry was kept down by the disabling and total destruction of many boats in the recent gale.

A light wind from the N. E. sent the boats over the course in good time. All marks were left to starboard. It was a run to the stake boat off Sea Gate, a reach to Fort Hamilton, windward work to the buoy off the Marine and Field Club, and a reach home to the start off Ulmer Park. This distance was covered twice, aggregating six nautical miles.

Trouble and Spots had competed in the fall regatta of the Atlantic Y. C. which was started earlier in the day, and so did not get to the line until late. The judges consented to send them once over the course. Adeline went but a single journey to Red Can buoy No. 2 off Coney Island Point, thence to Craven Shoal and home, a distance of four miles. The first two legs were reaches and the last a beat.

Among the smaller boats Ogeemah took an early lead and was first throughout the event. In the light wind the open catboat, Martha M., made the best elapsed time for the inside course. The class P boat, Folly, protested Karma for fouling. The summary:

	Start.	Finish.	Elapsed.
Adeline, J. B. O'Donohue.....	4 28 37	4 28 37	1 25 37

	Start.	Finish.	Elapsed.
Ogeemah, Brophy & Mackay.....	4 44 07	4 44 07	1 38 07
Karma, J. C. Erskine.....	4 48 11	4 48 11	1 42 11
Folly, J. A. Sutter.....	4 49 35	4 49 35	1 43 35

	Start.	Finish.	Elapsed.
Trouble, W. H. Childs.....	5 05 40	5 05 40	0 48 40
Spots, D. D. Allerton.....	5 11 05	5 11 05	0 54 05

	Start.	Finish.	Elapsed.
Martha M., Richard Moore.....	4 55 47	4 55 47	1 37 13
Boozie, C. D. Durkee.....	4 56 40	4 56 40	1 38 40

	Start.	Finish.	Elapsed.
Esperance, T. A. Hamilton.....	5 10 57	5 10 57	1 49 57
Stinger, A. P. Clapp.....	5 30 57	5 30 57	2 09 57

The winners were Ogeemah, Trouble, Martha M. and Esperance. Adeline scored a sailover.

The newly organized yacht club for Patchogue has been progressing rapidly. The name decided upon is the Great South Bay Y. C. At a meeting of the club a short time ago, the committee appointed to find a suitable site for a club house reported that they had received an offer from Mrs. Kate L. Gilbert, a summer resident, who owns a country seat on the Patchogue River. Mrs. Gilbert offers to present to the club, for the purpose of erecting a club house, property having a frontage on the bay of 50 feet and depth of 450 feet. It is proposed by the club to accept Mrs. Gilbert's offer, and also try and secure adjoining property so as to have a wider shore frontage. The membership of the club is increasing with surprising rapidity, all of which indicates that the new yacht club will be a great success.—Brooklyn Times.

Pacific Interclub Y. A.

SAN FRANCISCO, CAL.,

Wednesday, September 9.

The thirty-eighth annual regatta of the Pacific Interclub Yachting Association was sailed on Wednesday, September 9.

At 2 P. M. the starting whistle for the 20-footers was sounded; and the yawl Kittiwake, with the sloops Ruby, Mistral and Zada, crossed the line between two stakeboats anchored off Powell street wharf. The tide was ebbing and there was a fair breeze, which freshened as the afternoon wore on.

In the yawl special class there were four entries; Iola took first place by a margin of 4m. 12s., corrected time.

In the 30ft. class the sloop Challenger won easily, making better time over the course than any yacht in the 30ft. or 44ft. classes. Her elapsed and corrected times were 2h. 29m. 52s. Helen was second in a corrected time of 2h. 44m. 34s. Æolus finished 1s. ahead of Truant; she beat her by that small margin.

In the 36ft. class Harpoon beat Edna by 1m. 38s., corrected time.

Interest was increased in the 44ft. class by the appearance of the sloop Nixie. Though the elapsed time of Nixie was 1m 32s. better than that of her competitor, Speedwell's time allowance of 3m. 26s. brought her in a winner.

Rollo Smith, judge on the windward stakeboat Alice, reported last night that the yawl Iola fouled the starboard stay of the Alice with her jigger, and that the sloop Æolus fouled the mainsheet of the sloop Truant.

The races were under the management of the Regatta Committee of the Pacific Interclub Yacht Association, consisting of S. Middlemas, of the Corinthian Y. C., chairman; G. E. Smith of the San Francisco Y. C., R. R. L'Hommedieu of the California Y. C., P. J. Weniger of the Vallejo Y. C. and Louis Sonniksen of the South Bay Y. C. C. J. Lancaster was referee, George E. Smith and Louis Sonniksen were judges, and P. J. Weniger and R. R. L'Hommedieu timers. The summary follows:

21ft. Special Class—Start, 2:00.			
	Finish.	Elapsed.	Corrected.
Kittiwake	3 22 18	1 22 18	1 16 50
Ruby	3 05 30	1 05 30	1 05 11

Stuyvesant Y. C.

FLUSHING BAY, LONG ISLAND,

Sunday, September 20.

The fourteenth annual regatta of the Stuyvesant Y. C. was sailed Sunday, September 20, in a brisk N. E. wind.

The classes did not fill as well as had been expected on account of the number of yachts which were disabled in the gale of the previous week.

Whileaway, W. B. Corsett and C. T. Wills, parted haliards during the race, and Alva carried away her mast.

Jack Rabbit entered a protest against Ripple for passing on the wrong side of a channel buoy. The summary follows:

Class A—Cabin Sloops 30ft. and Over—Start, 12:10.	
Pinochle	4 40 30
Class C—Cabin Sloops between 20 and 25ft.—Start, 12:10.	
Ripple	7 00 00
Jack Rabbit	7 15 15
Class D—Open Sloops 22ft. and Over—Start, 12:10.	
Eleanor	5 19 30
Leonora	5 25 30
Pearl Louise	Not timed.
Class E—Cabin Cats—25ft. and Over—Start, 12:10.	
Teddie, Jr.	5 46 00
Whileaway	Did not finish.
Alva	Did not finish.
Class F—Cabin Cats between 20 and 25ft.—Start, 12:15.	
Spray	4 35 00
W. B. Corsett	Not timed.
Class H—Open Cats 22ft. and Under—Start, 12:15.	
Colleen	2 34 00
C. T. Willis	3 04 45
Ping Pong	3 12 45
Class I—Open Sloops—Under 20ft.—Start, 12:20.	
Viola	Sail over.
Class J—Yawls Under 18ft.—Start, 12:20.	
Hobo	Sail over.

The winners were Pinochle, Ripple, Eleanor, Teddy, Jr.; Spray, Colleen, Viola and Hobo.

Lynn Y. C.

LYNN, MASS.,

Monday, September 7.

The annual Y. R. A. open race of the Lynn Y. C. was sailed off Bass Point, Nahant, on Labor Day, September 7. The breeze was all around the compass and was so light and fluky that there was little shown in the results of the racing. In the 25-footers Chewink III. got away first and led Great Haste all over the course. In the 22-footers Tayac was away first, but Medric took the lead on the first leg and held it to the finish. In the 18ft. knockabouts Chance won in a general drifting match. In the other classes the boats were fairly well bunched on the first round, but on the second they were all spread out on account of the flukes. The summary:

Class D—25-footers.	
Chewink III., F. G. Macomber, Jr.	2 45 42
Great Haste, T. K. Lothrop, Jr.	2 50 30
Class E—22-footers.	
Medric, H. H. White.	2 37 26
Opitsah V., H. S. and H. J. Foster.	2 46 00
Tayac, W. H. Joyce.	2 55 25
Peri II., George Lee.	2 58 38

Class I—18-footers.	
Chance, Reginald Boardman.	1 50 10
Question, J. H. Hunt.	1 57 14

Boston Y. C.

BOSTON, MASS.,

Wednesday, September 9.

The last race of the season to be given under Y. R. A. of M. rules was given by the Boston Y. C. off its Hull station on Wednesday, September 9. The wind was light, varying from E. to S. W. In the 25-footers Sally VII. had things about all her own way after the start. Early Dawn sailed a good race in this class, and finished a strong second. In the 22ft. class Tayac got away first and led all over the course. The 18-footers were bunched at the start, and soon after Chance and Domino got into a luffing match, during which Question got away and established a lead, which she held to the finish. Chance got the better of the argument with Domino and held second place to the finish. Chance, however, was protested by Aspinquid II. In the one-design dorics Vera won a close race. Jacobin was first over the finish line in the handicap class, but lost to Bonito on time allowance. The summary:

Class D—25-footers.		Elapsed.
Sally VII., L. F. Percival.....	1 14 36	
Early Dawn III., J. E. Doherty.....	1 16 09	
Chewink III., F. G. Macomber, Jr.....	1 17 09

Atlantic Y. C.

SEA GATE, L. I.,

Saturday, September 19.

The fall regatta of the Atlantic Y. C. was held on Saturday, September 19, over courses in the Lower Bay. The chief interest in the event centered in the struggle among the 30-footers. Oiseau, Alert, Bobtail and Bagheera had met earlier in the year in the races for the Manhasset Bay Challenge Cup. Alert successfully defended the trophy. Oiseau finished third and Bobtail fourth in the contest on points.

Ever since those races the Atlantic Y. C. boats, including Vivian II., a Herreshoff creation, purchased since the cup contests, have wanted to try conclusions with Oiseau and Alert. Overtures were made to these boats and they were at last persuaded to leave the Sound waters and come to Sea Gate.

A sweepstakes trophy was arranged to which the club contributed a snug sum. This was to be divided among the winners of the first three places according to common agreement for a series of three races on points. The system in use gives a boat one point for starting and one for every boat she defeats, with the understanding that points for all races after the first shall be figured on the number of boats in the initial event.

The contest on Saturday was the first of the series. The visiting boats proved the smarter, and the struggle resolved itself into one between Oiseau and Alert for first honors. The Maxwell boat finally won out by 17s. actual time. Bobtail beat Bagheera for third place by 2s.

The 30-footers went twice out to West Bank Light and back, a distance of 12 nautical miles. It was a broad reach out and a beat home in which the tide was a potent factor. The event for these boats was started at 3:05 P. M.

The other craft were sent away shortly after 11 o'clock in the morning. The regatta committee was on the tug Union. The smaller boats went out to Old Orchard Shoal Light and return, a distance of 12¼ nautical miles. In the light N. E. wind blowing it was a run out and a beat home.

The tide was ebbing nearly all of the journey, and craft

which worked home under the Staten Island shore had the better of the struggle. Naida, recently built from the lines of Mr. Henry J. Gielow, finished far ahead of the rest of the fleet. Mary and Apukwa II. did much better than usual. With the two remaining races in the 30-foot series the yachting season of the Atlantic Y. C. ends. The summary:

Sloops—Class M—Start, 3:05.			
	Finish.	Elapsed.	Corrected.
Oiseau, H. L. Maxwell.	6 07 07	3 02 07	2 58 27
Alert, J. W. Alker.	6 07 20	3 02 20	3 00 27
Bobtail, E. F. Luckenbach.	6 10 15	3 05 15	3 02 37
Bagheera, Hendon Chubb.	6 10 17	3 05 17	3 03 31
Vivian II., S. E. Vernon.	6 13 18	3 08 18	3 08 18
Sloops—Class P—Start, 11:20.			
Naiad, Dr. J. B. Palmer.	2 46 03	3 26 03	3 26 03
Corona, J. E. Beggs.	3 05 23	3 45 23	3 45 23
Vagabond, T. A. Vernon.	3 10 20	3 50 20	3 50 20
Smoke, L. H. Dyer.	4 30 27	5 10 27	5 10 27
Kate, J. S. Negus, yawl.	Did not finish.		
Sloops—Class Q—Start, 11:20.			
Mary, Max Grundner.	3 31 18	3 41 18	3 41 18
Careless, F. J. Haynes.	3 12 36	3 52 36	3 52 36
Wraith, Calvin Tompkins.	3 18 25	3 58 25	3 58 25
Trouble, W. H. Childs.	3 28 38	4 08 38	4 08 38
Spots, D. D. Allerton.	3 34 50	4 14 50	4 14 50
Sloops—Class R—Start, 11:25.			
Apukwa II., E. S. Tefft.	3 22 50	3 57 50	3 57 50
Scalawag, E. S. Ludlow.	3 31 10	4 06 10	4 06 10

The winners were: Oiseau, Naiad, Mary and Apukwa II.

September 20.

The series for the 30-footers ended with two races held on September 20; Alert finished first for the three contests with 13 points. Vivian II. was close behind with 10. Bagheera got 8, Bobtail 7, and Oiseau 5.

The two last races were held in a fine breeze from the N. E. Vivian II. and Alert had it nip and tuck for first honors. The Vernon boat finished first in each, but lost the morning race by 29s corrected time. In the second she was victorious by 32s. corrected time. Oiseau had hard luck. She was disabled in the morning event and withdrew in the afternoon.

The first race on September 12 was over a triangular course. The boats had a broad reach to Craven Shoal bell buoy, another reach to West Bank Light, and a beat home. The journey was covered twice and aggregated fourteen nautical miles. In the afternoon the course was to Old Orchard Shoal Light and return. It was a run out and a beat home, a distance of 12¼ nautical miles. The summary:

Sloops—Class M—Start, 9:35.			
	Finish.	Elapsed.	Corrected.
Alert, J. W. Alker.	12 02 24	2 27 24	2 25 07
Vivian II., S. E. Vernon.	12 00 36	2 25 36	2 25 36
Bagheera, H. Chubb.	12 05 22	2 30 22	2 28 13
Bobtail, E. F. Luckenbach.	12 12 28	2 37 28	2 34 18
Oiseau, H. L. Maxwell.	Disabled.		
Afternoon Race—Start, 2:05.			
Vivian II., S. E. Vernon.	4 19 47	2 14 47	2 14 47
Alert, J. W. Alker.	4 22 14	2 17 14	2 15 19
Bagheera, H. Chubb.	4 25 02	2 20 02	2 18 07
Bobtail, E. F. Luckenbach.	4 30 10	2 25 10	2 22 29
Oiseau, H. L. Maxwell.	Did not finish.		

Atlantic Y. C. Ocean Race.

September 7 to 13.

524 Miles.

The regatta committee of the Atlantic Y. C. has issued the official figures of the long ocean race which started on the morning of Labor Day, September 7, and ended with the finish of the last boat on Sunday, September 13. Morten F. Plant's Herreshoff creation, Ingomar, was the winner. She beat Hildegard, her nearest rival, by 21h., 27m. and 56s. Endymion was third, Iroquois fourth, and Fleur de Lys fifth. Thistle withdrew. The compass course of the event follows:

	Course.	in Miles.
Scotland L. V. to Nantucket Shoal L. V.	E. ½ S.	190
Nantucket Shoal L. V. to North East End L. V.	W.S.W. ¾ W.	242
North East End L. V. to Barnegat Bell Buoy	N.N.E. ¾ E.	52
Barnegat Bell Buoy to Scotland L. V.	N. by E. ¼ E.	40
Total		524

Each boat had interesting tales to tell of the long struggle. Minor accidents were frequent. Head winds and fog prevailed to an irritating degree. The schooners in the race were the best for ocean going in these parts. It is likely that all will be seen in events of like nature next year. Each boat was separated by hours from the other, and corrected times were not figured out. The summary:

	Start.	Finish.	Elapsed.
	Sept. 7, P.M.	Sept. 11, A.M.	
Ingomar, M. F. Plant.	12 32 25	9 50 40	93 18 15
		Sept. 12, A.M.	
Hildegard, E. R. Coleman.	12 33 44	7 19 55	114 46 11
		Sept. 13, A.M.	
Endymion, G. Lauder, Jr.	12 35 00	12 09 00	131 34 00
		Sept. 13, A.M.	
Iroquois, J. G. N. Whitaker.	12 33 07	6 20 30	137 47 23
		Sept. 13, P.M.	
Fleur de Lys, L. A. Stimson.	12 33 33	12 59 00	144 25 27
Thistle, R. E. Tod.	12 33 33	Withdraw.	

Duxbury Y. C.

DUXBURY, MASS.,

Saturday, September 12.

The last championship race of the Duxbury Y. C. was sailed on Saturday, September 12, in a light E. breeze. Question led in the 18-footers for the greater part of the course. Aspinquid II. passed her on the last leg, but a little puff near the finish enabled Question to cross the finish line first. In the handicap class Challenge was first across the finish line, but lost to Ajireolus on time allowance. The summary:

18ft. Knockabouts.	
Question, J. H. Hunt.	2 29 30
Aspinquid II., C. M. Foster.	2 30 08
Miladi II., F. R. Adams.	2 31 22
Wink, L. B. Goodspeed.	2 31 30
Osprey, A. Train.	2 34 49

Beverly Y. C.

BUZZARD'S BAY, MASS.,
Saturday, September 12.

The last Corinthian race of the Beverly Y. C. was sailed in Buzzard's Bay on Saturday, September 12, in a fluky E. breeze. In the 30-footers Arabian got away first, followed by Notos. Soon after the start all the yachts were becalmed except Young Miss, which caught a little breeze. This gave her a lead which she held to the finish. In this class Mashnee is the winner of the season's championship. Terrapin, which won handily in the 21-footers, is also the winner of the championship of her class for the season, and gets a silver cup besides. In the fourth class cats, Allison II. had the race well in hand until she broke down, after which Krieker led to the finish. Allison II., however, is the winner of the class championship for the season. Spider won in the 15ft. class, and also gets the championship for the season. The women's cup in this class was won by Teaser, Mrs. R. W. Emmons. In the special class of 15-footers Dahinda won easily. The summary:

30-footers.		Elapsed.
Young Miss, D. L. Whittemore.....	2	06 05
Mashnee, R. W. Emmons.....	2	07 20
Arabian, Robt. Winsor.....	2	08 10

Special Class—15-footers.		
Dahirida, C. L. Curtis.....	1	27 30
Chico, G. P. Gardner.....	1	30 20

Saturday, September 19.

A special race of the Beverly Y. C. one-design 30-footers was sailed on Saturday, Sept. 19, in which all the yachts were sailed by professionals, while owners followed in the steam yacht Genevieve. The breeze was light and steady from the N. E. Notos led until the first mark was turned, after which Young Miss took the lead and held it to the finish. The summary:

		Elapsed.
Young Miss, D. L. Whittemore.....	2	17 30
Evelyn, John Hitchcock.....	2	20 19
Quakeress, W. H. Harrison.....	2	21 20
Notos, C. H. Taylor, Jr.....	2	21 22

“Forty Years On.”

Contest for the America's Cup—1943.

6 A. M. (Sandy Hook).—Shamrock XXIII. is preparing for the third race, which is over the triangular course today. Sir Thomas Lipton, despite two defeats, has still implicit confidence in his boat. He gives it as his opinion that the challenger is even a better boat than Shamrock XVII., which made such a close fight for the Cup twelve years ago.

7 A. M. (New York).—Wind is now blowing 6.3 knots from S. S. E. Sir Thomas says, “This is Shamrock's weather.” Pressed to say more, he added: “The defender is certainly a wonderful boat, but the Cup is never won until the best boat takes three races.”

7:45 A. M. (Sandy Hook).—Shamrock XXIII. was re-measured after yesterday's spin, and supporters of the British boat will be pleased to learn that by taking six inches off the boom and two feet from the baby jibtopsail, her time allowance has been increased by nearly twenty minutes, making the total one hour, forty-two minutes. This will add greatly to her chance of winning. Sir Thomas Lipton is reported to have said, “May the best boat win.”

Yesterday Sir Thomas Lipton was presented with another mascot by the President's daughter. It took the shape of a handsomely bound album, containing photographs of the twenty-two previous Shamrocks. At the end of the book was a photograph of the much-coveted Cup, with the inscription underneath:

LIFTED BY SHAMROCK NO.....

DATE.....

Sir Thomas was much touched, and is reported to have

said, with a catch in his voice, “May the best boat win!”

10:59 A. M.—The competitors are jockeying for the windward berth.

11 A. M. (Sandy Hook).—They're off!—(From our Special Correspondent.)

[Copyright in both Hemispheres.]

11 A. M. (Sandy Hook).—The yachts have started.—(Central News.)

11:01 A. M.—The Defender has secured the windward berth for the one hundred and thirty-third successive time.

11:20 A. M.—Shamrock XXIII. seems to point higher than ever, and is footing it very fast. The Defender refuses to split tacks, and is eating her way greedily into the wind, being pinched for all she is worth. Shamrock is slowly but surely forging astern.—(Anti-Marconi.)

Later. 11:40 A. M.—Shamrock is going about.

11:40½ A. M.—Shamrock has gone about.

Much Later. 1:50 P. M.—Shamrock has rounded the mark and has gone to look for the Defender, which is out of sight. Sir Thomas Lipton is confident as ever, and has just remarked, “The race is not over yet. However, may the best boat win.”—(Reuter.)

Later Still. 3:41 P. M.—Shamrock is nearing home and has reduced her disadvantage, as far as one can judge, to twelve and a half miles. Her baby jib has given a lot of trouble.—(Central News.)

4:10.—Result: Shamrock was beaten by fifty-six minutes, after deducting her time allowance.

The news created little or no surprise in New York. Sir Thomas Lipton, after the race, is reported to have remarked (with a catch in his voice), “The only thing I can say is that we did better to-day than we did this time ten years ago. Perhaps with more or perhaps with less wind the result might have been different. It is hard to admit it, but ‘the best boat won.’ I had previously expressed a wish to that effect.”—(Our Special Correspondent.)—Punch.

Lloyd's Rules for Yacht Building.

THE Committee of Lloyd's Register of Shipping have now issued their new Rules for the Building and Classification of Wood, Steel and Composite Yachts.

Rules for yachts were first issued by the committee of this society in the year 1878, when the first yacht register was published by the society. Since that time the form and construction of yachts, more especially those used for racing purposes, have undergone many changes, and in consequence it was necessary that the rules for these pleasure craft should be so modified and amended as to render them more suited for the types of such vessels as are now commonly being built. To aid them in revising these rules, the committee of Lloyd's Register and their staff invited the opinions of the leading yacht builders and designers both in the United States of America and in Great Britain, and their suggestions were adopted as far as considered practicable.

The rules now published are therefore the result of the careful consideration both of the committee of Lloyd's Register and of prominent experts in yacht construction.

A new scantling basis has been adopted for all types of yachts, in which the length of the “bilge diagonal” has been introduced in order to insure that the finer yachts shall have a smaller scantling than those of fuller form.

Not only has the basis of the yacht rules been modified, but considerable additions and extensions have been made both in regard to the details of requirements as well as in the tables for the various descriptions of scantlings, and further the value of the book has been greatly enhanced by the addition of numerous illustrations showing the various approved modes of construction as commonly adopted in wood, steel and composite yachts, and the manner in which the rules and tables severally apply to them.

The number of yachts built under the rules of Lloyd's Register goes on increasing from year to year, and the society now issues two registers devoted exclusively to yachts, one in New York, which contains particulars of some 2,800 American and Canadian yachts, and has already in the first year of its publication met with a large measure of support from the leading yachtsmen in the States, and the other in London, which contains particulars of some 8,000 yachts, and has a circulation of over 2,000 copies annually.

For the survey and classification of yachts the society's large staff of surveyors is available. These officers number over 300, and are stationed at New York, Boston, and Philadelphia, as well as other ports in the United States and Canada, Great Britain and Ireland and abroad.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Mr. Hollis Burgess has made the following sales through his agency: The 25ft. waterline sloop Onda, owned by Mr. John Greenough, of New York, to Mr. F. F. Cutler, of Boston, and the 25ft. waterline auxiliary yawl Cavalier, owned by Mr. Walter C. Lewis, of Boston, to Mr. W. G. Dunham, of New Rochelle. Mr. Burgess's business has increased to such an extent that he has found it necessary to move into larger and more desirable offices. After Monday, September 21, Mr. Burgess will be located in the Board of Trade Building, 131 State street, Boston, Mass.

Shamrock II. has been sold and she will be broken up for junk. Captains “Lem” Miller and Charles Barr are the purchasers, and it is stated that they paid \$7,000 for the boat. Captain Miller was in charge of Columbia this season when she raced against Reliance and Constitution, and he sailed on Reliance in the races against Shamrock III.

The easterly gale that swept the coast on September 16 did great damage to shipping and yachting. A number of lives were lost and many yachts were swept ashore all along the coast from New Jersey to Massachusetts and wrecked or badly injured. Most of the damage was done to the smaller craft; few of the larger boats that employed regular crews met with mishaps. It is impossible

to estimate the damage done, and it is fortunate that the gale did not occur in the summer, for then many yachtsmen would have been deprived of a season's pleasure. Then again a large number of boats had already been put in their winter quarters, and in this way were saved from possible destruction.

Mr. George Grouse Cook and Captain Howard Patterson, naval architects, have received an order from a New York yachtsman for a large ocean-going steam yacht. The yacht will be built of steel and will be very completely fitted throughout. She is to be 206ft. over all, 172ft. waterline, 32ft. breadth, and 12ft. draft. The yacht will have a speed of twelve knots under natural draft.

At the annual meeting of the Manchester Y. C. the following officers and committees were elected: Com., E. S. Grew; Vice-Com., S. Parker Bremer; Rear-Com., E. A. Boardman; Sec'y and Treas., H. B. Pearson; Executive Committee, the above officers and A. M. Merriam, one year; A. F. Bemis and F. W. Fabyan, two years; George Wigglesworth and T. K. Lothrop, three years; Regatta Committee, R. DeB. Boardman, chairman; Reginald Boardman, Norton Wigglesworth, George Lee and H. B. Pearson; Meas., David Fenton.

Messrs. Tuthill and Higbee, of Greenport, L. I., are building a wooden steam yacht for the Rev. F. L. Humphreys, of Morristown, N. J. The yacht will be 100ft. over all, 18ft. breadth, and 5ft. draft. The yacht will have twin screws, and she will be fitted with an Almy water tube boiler and compound engines, which are designed to produce 120 horse-power.

Commodore Weaver of the Seaside Park Y. C., has selected the following committees to serve for the ensuing year:

House Committee—Charles J. Rainear, chairman; Henry P. Orlemann, Thomas Nelson, Joseph R. Wilson, Ormond Rambo.

Regatta Committee—George S. Gandy, chairman; R. Herbert Crowell, Dr. Geo. H. Thacher, Nelson Gaskill, Herman Muller, A. Lynn Sailer, John D. Johnson, Jr.

Membership Committee—Harvey T. Weber, chairman; Henry P. Orlemann, Sidney W. Prince, Alfred R. Gandy, Calvin F. Crowell, Dr. Charles Harker.

Entertainment Committee—B. B. Lister, chairman; Frank Thacher, Thomas Nelson, Jr.; Norris E. Henderson, Edwin C. Nevin.

Press Committee—Joseph R. Wilson, chairman; Sidney W. Prince, H. A. Rubins, Herman Muller, Thomas H. Cameron.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

New York C. C.

BENSONHURST, L. I.,

Saturday, September 19.

The New York Canoe Club held a handicap regatta on the afternoon of Saturday, September 19, over courses in Gravesend Bay. The event was for open sailing canoes, a large fleet of which flies the burgee of the well-known organization. The course was triangular 1½ miles in extent. Handicaps were arranged according to the showing made in the annual fall regatta on Saturday, September 12. A. M. Poole was the winner. The summary:

Open Canoes—Start, 4:22.		Finish.	Elapsed.	Corrected.
A. M. Poole.....	5	56 45	0 34 45	0 32 45
A. Wilmarth.....	4	58 10	0 36 10	0 33 10

W. Velland, Jr.....	5	01 10	0 39 10	0 35 10
L. B. Jennings.....	5	10 50	0 48 50	0 45 50

Perry, Okla., Tournament.

THE Perry, Oklahoma, boys are now congratulating themselves on the big crowd that was in attendance at the shoot held Sept. 14 and 15. The weather was about as bad as it could be, and that caused the attendance to fall off on the last day. All through the two days there was rain, accompanied by strong wind. This caused the targets to take almost any old flight, and made the shooting conditions as hard as one could imagine. The best exhibition of target smashing was given by the traveling men, Faurete and Hubby, and they had a very even race from start to finish.

Mr. Kirby was not in his usual good form, and his scores fell away. That other very old-time Kansas shot, Reust, of McCloud, was on the sick list, and he did not come to the front as usual. The high amateur score was won by Mr. Rohrer, and he had the limit of 19yds. The scores:

First Day, Sept. 14.

Events:	1	2	3	4	5	6	7	8	9	10	Shot	Broke.

IN NEW JERSEY.

Jeannette Gun Club.

Guttenberg, N. J., Sept. 18.—The Jeannette Gun Club held its September shoot to-day. Mr. Van Valkenburg was a guest. The weather was delightfully pleasant. The birds were very fast. In the challenge medal contest, Mr. Hainhorst defeated Mr. Pape by a score of 12 to 11 out of a possible 15. Schorty won Class A; Wohlieb won Class C. The scores:

F H Ehlen, 28	1002001221	6	C Meierdiercks, 28	2111111201	9
F Karstens, 28	1*11000211	6	C Interman, 28	2122210000	6

Hudson Gun Club.

Jersey City, N. J., Sept. 20.—These scores were made at the regular shoot of the Hudson Gun Club:

Events:	1	2	3	4	5	6	7	8	9
Targets:	15	15	15	15	15	15	15	15	20
Schorty, 18	14	11	6	12	11	12	13	11	19
Dudley, 18	13	12	13	13	15	11	12	12	18
Edwards, 19	9	11	13	12	13	12	11	11	18
Van Valkenburg, 18	13	14	12	8	11	10	11	9	16
Gillie, 18	6	10	6	5	7	5	2	2	11
Headen, 18	12	7	5	8	11	9	11	11	18
Wheeler, 18	11	11	9	11	11	11	11	11	18
Malcomb, 18	6	9	8	5	6	8	11	11	18
Carl Von L, 18	9	9	9	9	9	9	9	9	12

These scores were made at the shoot of Sept. 6 by members of the Hudson Gun Club. Mr. Van Dyne made the only clean score:

Events:	1	2	3	4	5	6	7	8
Targets:	25	25	25	25	25	25	25	15
C V L, 18	20	24	24	21	21	21	21	15
Edwards, 18	21	20	20	23	18	20	19	10
Gillie, 18	19	14	12	13	13	13	13	10

Van Dyne, 18	19	25	19	18	16	17	16	11
Headen, 18	18	16	17	16	17	16	17	11
Van Valkenburg, 18	21	23	17	14	20	20	20	11

Van Valkenburg and Edwards shot several matches, the former winning.

Emerald Gun Club.

Carlstadt, N. J., Sept. 15.—The September shoot of the Emerald Gun Club was well attended. The birds were good in the first 50; afterward fair. The weather was pleasant.

At Decatur, Ill., recently, high average was won with a Lefever gun, with the excellent record of 95.75 per cent. The Lefever Arms Co., Syracuse, N. Y., will send descriptive catalogue to applicants.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, OCTOBER 3, 1903.

VOL. LXI.—No. 14
No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

STATE GAME REFUGES.

ALMOST every State in the Union contains within its borders land available for game refuges. In many cases this land is already owned by the State, or if owned by private individuals it is of such small market value that it might easily be acquired by the State at small cost under the law of eminent domain. In each State, therefore, it will be perfectly practicable—whenever the Legislature shall agree—to set aside State game preserves which, under proper provisions, would furnish sufficient game to supply the wants of the citizens of that State.

Attention has very many times been called to the extraordinary results which followed the protection of the Yellowstone National Park. It is only about twenty years since the effort to prevent the killing of game within that National Reservation was first made, and it is only about ten years since Congress provided a method for preventing that killing which proved effective. Those of us must be dull indeed who do not realize what that game refuge has done for a great territory, and for all of us the matter has been made more plain by the visit of President Roosevelt to the National Park last spring. At that time every newspaper in the land was full of what the President saw and did, and of the hordes of game that he closely approached and counted. It was well that the Chief Magistrate—himself an ardent and accomplished sportsman, and so not needing the lesson—should see with his own eyes what absolute protection will do for wild game, and it is well also that by means of his visit to this Wonderland all our citizens should have had the oft-told tale of what rigid protection has done and is doing reinforced.

Since such refuges can perform such miracles, is it not true that the various States should act on the lesson thus conveyed? Within the last twenty years the sentiment in favor of the protection of natural and wild things, whether they be trees or flowers or birds or mammals, has advanced by leaps and bounds, but it is high time that all who are interested in such matters should put their united shoulders to the wheel with more energy than ever, and should push hard to get the heavy legislative wagon to move in the desired direction. Long discussions as to the rights of the large landowner over his own property are interesting to those who take part in the discussion, and probably to a few others, but such debates are not likely to have any immediate practical results. In our day legislatures are not likely to interfere with property rights in general, but legislatures may be induced to set aside tracts of State land as absolute refuges, or to appropriate money for the purchase of lands of little value, for the purpose of making game refuges of them. The National Government has more than once shown its readiness to set aside portions of the public domain for purposes kindred to those of game preservation, and for years has been discussing the question of appropriating large sum of money for the purchase of the Appalachian Park in the south. The great area of our forest reserves is a strong testimonial to the growing intelligence of the country, and to the wisdom of our Presidents.

Surely now, if ever, the time is ripe for concerted and practical action looking toward the preservation of the wild things of this country. It is time that the State and the Federal Government should move actively in these matters. The fundamental reason for such action was given by President Roosevelt in a speech last winter, when he said that it was the duty of the Government to set aside these refuges and reserves for the benefit of the poor man; the rich were able to buy land and make and care for preserves of their own, but for the poor man, unless the Government acted for him, there would soon be no place where he could enjoy outdoor life and the glorious sports of the field.

It appears to be a self-evident truth that every pre-

serve is a public advantage. There are preserves owned by a single individual covering a thousand or ten thousand acres where no one is permitted to shoot. There are other tracts owned by a multitude of small landowners, but aggregating a thousand or ten thousand acres, where each landholder posts his land and no one is allowed to shoot or fish. It would be difficult to point out in what respect the case of the single landholder, protecting his ten thousand acres, differs from the thousand landholders who protect their ten thousand acres.

The practical question is how may we best protect the game in different localities, so that the supply of each species shall be maintained beyond any danger of destruction, so that we and our children who are to come after us, may see and take pleasure in seeing these wild creatures, and finally so that we may have an opportunity of hunting them under proper restrictions, and thus being out of doors and gaining the health, strength and vigor, which, in the business struggles of the day, we are all of us likely to lose.

Just as, in our cities, parks are set aside for the benefit of those residing near them, so in each State there should be vastly larger areas set aside for the benefit of those who can take a few days or a few weeks from their usual toils to live out of doors. Just as the people who frequent the city parks are forbidden to destroy the shrubbery and to kill the little birds and animals that inhabit there, so those who frequent the larger reservations should be forbidden to destroy the living timber, or to kill the birds and animals found there. Fish belong in a different category because fish can be artificially supplied, while birds and animals cannot be replaced.

TREASURE SEEKERS.

A SAN FRANCISCO dispatch reports the return of members of an expedition which sailed last year from that port in search of the buried treasure of Cocos Island. Some years ago our contributor, Tarpon, writing of his seafaring life, told of a visit to Cocos, and alluded to the legend of the treasure buried there long ago by pirates. This prompted Capt. R. L. Ogden, Podgers, to tell the Cocos story with more detail. In the early years of the nineteenth century a crew of pirates captured a Spanish ship off the coast of Peru and took from it a great store of gold and silver, with which they sailed to their rendezvous on Cocos Island, in the Pacific, 600 miles southwest from Panama. There they lived not only riotously, after the approved way of all pirates, but so strenuously that after a troubled time of dog eat dog, only four of the crew survived. These, fearing to be discovered so few with so great treasure, buried the gold and silver and set sail for the Isthmus. Arrived off Panama they burnt their ship, landed on the coast in a small boat and dispersed. Three of the four died without revealing the secret; the fourth made a deathbed confession and imparted to his confidant the precise location of the island and of the spot on the island where the treasure was buried. Once upon a time when Captain Ogden was in New Orleans engaged in fitting out a schooner for a voyage to Mexico, this person turned up there, displayed tattooed on his arm a map of the island, together with the latitude and longitude, and unsuccessfully endeavored to persuade Captain Ogden to change the destination of his schooner from Mexico to Cocos. Not long afterward Captain Ogden, having sent a schooner yacht from New York to San Francisco, there sold it to a party of Cocos Island treasure seekers. They, too, had listened to the story of the man with the tattooed arm. They fitted out the craft with all the appliances of a well equipped treasure hunter, surveying instruments, pickaxes and shovels, and a great lot of stout canvas bags to hold the gold and silver. In due time they returned, chagrined and empty-handed. This expedition was only one of a number. Writing in 1897, Captain Ogden related that he had known of four expeditions to find the Cocos treasure, each of which had returned with nothing to show for their pains. We have recorded at least one more since then, and now comes the story of this latest one, which, like all the rest, has ended in disaster.

Better fortune has attended the quest of a treasure seeker on the East Coast of Florida. There has long been current in the vicinity of Miami the story of a wreck of a Spanish vessel laden with silver ore from the

mines in Mexico. She was reported to have gone ashore in 1835 on one of the reefs opposite the numerous keys off the southern end of the peninsula. Sixty years ago a sailor appeared at Miami with a chart showing the site of the wreck, and long sought to enlist the co-operation of the credulous in a scheme to recover the wealth. The sailor died, but the chart was preserved, and guided by it Captain Joseph Jennings, master of the little schooner Osceo, has spent years searching the reefs up and down the keys; and the other day Miami was excited by the news that the search had ended in the finding of the treasure-laden wreck. The tale was received with skepticism, but an air of truth has been given to it by the very business-like action of Captain Jennings, who, through his attorney, has filed a libel on the wreck with the United States Court at Jacksonville. In the document is duly set forth that Joseph Jennings, master of the licensed wrecking schooner Osceo, libels for himself the cargo of a vessel of unknown name, lying at the bottom of the Atlantic Ocean, about one and one-quarter miles north of Hillsboro River Inlet; that the vessel lies just off shore in water from four to six feet deep, the hull covered with sand; and that under the sand is a cargo "which libellant has reason to believe and does believe to be of great value."

The United States Marshal for the district has stationed a deputy to guard the wreck. Surface digging has disclosed silver ore beneath the sand in the hull, and there is a possibility that the wreck may prove to be the actual treasure ship of the old story.

LAST Saturday, two days before President Roosevelt's departure from Oyster Bay, the village was thrown into a state of vague fear and wild excitement by the appearance of two prisoners securely handcuffed and brought into town by a deputy sheriff armed with a Winchester rifle. The officer barely had opportunity, before the wires dispatched their thrilling stories, to explain that the prisoners were Italians caught red-handed in the act of killing robins.

If all the Italian robin shooters were fitted out with handcuffs, the Long Island sheriffs would have to import a vastly increased supply of irons. The song bird shooter of foreign extraction is a perfect scourge on the island at this season. He is in evidence everywhere. He not only destroys the birds, but is a bold and defiant trespasser, a destroyer of property, a menace to stock and human life. There is not the slightest reason for tolerating this nuisance. If the local authorities cannot suppress it, they should appeal to Protector Pond for special officers.

No OTHER non-resident hunting license law has been received with so much resentment as that of Maine. From all that we can learn a very large number of sportsmen who have in past years visited the Maine woods for deer and moose will this season either go to Canada or give up their big-game hunting. Our Maine correspondent in another column explains that the talk of a guides' union to raise wages has been prompted by a fear on the part of the guides that they may not have the usual amount of employment this year; and they reason that if there shall be fewer to pay them, the fewer must pay more in proportion. It is as yet too early to tell what the actual deterrent effect of the non-resident law may be. Commissioner Carleton, who was last year the author of some wildly picturesque statistics, is quoted as hedging this year in his estimate of the number of sportsmen who have visited Maine for moose. But of Mr. Carleton's figures it may be said that they are at best unreliable and not to be taken seriously.

HERE is a useful hint from Sir Anthony Fitzherbert's "Book of Husbandrie," for the advantage of the sportsman tourist. It is a list of articles to teach a gentleman's servant to say at every time, when he taketh his horse, for his remembrance, that he shall not forget his gere in his inne behynde hym: "Purse, dagger, cloke, nyghtcap, kërchef, shoying horn, boget, and shoes. Spere, mole, hode, halter, sadelclothe, spores, hatte, with thy horse combe. Bowe, arrows, sworde, bukler, horne, leishe, gloves, string, and thy bracer. Penne, paper, inke, parchmente, reedwaxe, pommies, bokes, thou remember. Penknyfe, combe, thymble, nedle, threde, poynte, leste that thy gurtre breake. Bodkyn, knyfe, lyngel, give thy horse meate, se he be showed well. Make mery, synge an thou can, take hede to thy gere, that thou lose none."

The Sportsman Tourist.

Musings at Sand Lake.

II.—A Unique Angling Region of Southern Michigan.

MENTION has recently been made in these columns of the excellent fishing at Devil's Lake, in Lenawee county, Michigan. As the angler there "runs" his trolling line along the winding edge of the deep water, and is rounding "Darlington's Point," rowing southwest, he sees, to the northeast, a range of hills that are very high for that region. Until a few years ago the highest hill, Prospect Range, was surmounted by the Government Survey tower, from which a view could be had of about thirty miles in all directions. That hill, with one exception, is the highest in the county, and in the Southern Peninsula of Michigan; and the view from it is the loveliest in the State.

It is a heavily wooded country, but is also patched to the horizon with lush fields of clover and of grain—oats, buckwheat, corn, wheat, and barley. On a clear day thirty-three inland lakes can be seen from that summit, like a string of pearls circling its foot. Far to the southwest, Round and Devil's lakes lie in their emerald settings. Sweeping northward and then to the east and south, this huge circle of water-gems sparkles back in answer to sun and stars, spring-fed lakes full of perch, bass, sunfish, bullheads, bluegills or pickerel. What an aggregation of bewildering opportunities for the fisherman! Evans, Wampler, Vineyard, Stony, Wolf, Allen, Clear, Dewey, Goose, Grass, Long, Deep, Phelps, Willow, Tamarack, Gull, and Meadow lakes are the largest, the thirty-three varying in size from less than four acres of area to lakes three miles long and nearly two miles wide.

I first saw the panorama from that crest in 1860, forty-three years ago. I was homeward bound after a timorous fishing trip in Iron Creek, the outlet of Wampler's Lake, while a lot of Lenawee county farmers were holding a patriotic meeting at Walker's Hotel, four miles north of Prospect Hill. That old hostelry was built by Sylvester Walker in 1839, and was kept for many years by an eccentric bachelor—Lyman Nearing. It was at the junction of the locally famous Monroe and Chicago turnpike, tremendously popular; and it furnished accommodations for thousands of "settlers," the pioneers of Southern Michigan. For twelve years there was a double daily line of stages running each way on that turnpike, and filled with passengers.

Nine miles northeast of the pinnacle of Prospect lies Sand Lake. I fished there in 1862. It was a surprisingly fine lake for black bass angling, and often is yet.

We drove to Evans Lake, one mile east of Sand Lake, and secured supper and lodging at a hotel then kept by John Davenport. He and his wife and their daughter Ella have been dead many years. Old residents there will remember the hotel and its "celebration" and anvil-frings, the dances and the fireworks on the "glorious Fourth" of 1862.

Evans Lake was then a great resort for anglers from Adrian and Tecumseh. It is about a mile across, with two islands, each of about three acres, and is nearly round, with very fine wooded banks. Sand Lake was then not available for fishing, as only three boats were there, and their owners had formed a trust to keep fishermen from using them.

The next morning Mrs. Davenport and daughter and the writer's mother and sister drove over to Sand Lake, where a canoe from Davenport's had been launched for them the night before. They stopped at the little house then owned by Agnes Campbell, who lived alone on the east shore. She had another little boat, one of the three in the trust; and the four ladies, unused to any boating, much less the work in the canoes, ventured out on what was to them a great lake, and to me, disconsolate yet spell-bound as I watched them from the shore, truly an ocean! How blue and fearsome it was, and how anxious I became as I saw the canoes career, and heard the loud admonitions to "sit straight" that were interchanged from the boats!

Those woman anglers used rough tamarack poles, coarse lines and heavy sinkers—tackle of the most primitive kind. They rowed out forty rods to the edge of the deep water, and anchored. Two of the party had a black bass hooked before the lines could sink. The small boy on shore was quite as delighted and full of excitement as the occupants of the boats. In half an hour one boat held eleven black bass of from one to five pounds in weight each; and the two fisherwomen in the other boat had five. Then the wind rose and one of the boats returned to the Campbell cottage. Not another bite was had there by the two ladies who ventured to remain on the lake. The waves grew so high that they rowed nearly two miles to the stiller water sheltered by the banks of what is now called Monigan's Cove. There they pulled in more bass until the minnows used for bait were gone. Then they used white grubs and pulled in great bluegills—a bushel of fish before dinner!

Two of the ladies are yet alive, one ninety-two, and the other, her daughter, sixty-five years old; and dozens of times through all the following years they have told about, and lived over again, that wonderful day with the fish on Sand Lake. I quote from their letter:

"We remember the lovely mashed potatoes, broiled steak from the hotel at the other lake, and the fried fish, flaky cream biscuits, and strawberries and honey that we devoured in the charming, quaint cabin of Mrs. Campbell under the oak trees of the east bank. The experiences of that day remain vivid and precious to us after forty years. Oh, the prized, dissolving views of this queer life."

And yet some people think that it is all of fishing to fish, and that women have no business to indulge in that kind of sport anyhow!

The next week a Mr. Rowley, from Tecumseh, came to the Evans Lake hotel with his wife and daughter. A lady boarder there took them to Sand Lake, and the prior fishing experience was repeated, with even better results. All four fished from one boat, with the rude poles, lines, sinkers and "bobbers." There was "no end" to the bites and landings of the bass while the minnows lasted; and

then came the bluegills—steel-blue sunfish weighing a pound each, and very good fighters. At 4 P. M. Mr. Rowley wound his big line around his tamarack pole and said: "I am satisfied for once in my life." There were a bushel and a half of fish measured at the hotel that evening, and a fish feast was enjoyed by all the guests for two days.

It will be understood by readers of FOREST AND STREAM what a vivid, lasting "impression" was made on the boy by watching that angling from the shore, and seeing and helping to eat the fish. It was natural that during all the following years he should occasionally cast minnows and frogs for bass on Sand Lake, and always with satisfactory results. He remembers a four-pound bass taken there with a ten-ounce rod in 1879, and a six-pound pickerel landed with such a small hook that the capture was owing solely to good luck. Again, in 1884, a large-mouth bass was taken after it had rushed under the boat and broken the tip of the rod—the finish of a fight that had continued ten minutes that seemed an hour. It

NORTH SHORE, LOOKING SOUTHWEST, SAND LAKE.

was the only large-mouth bass of hundreds taken that seemed to be as game as the small-mouthed bass. That was on another Fourth of July.

The excellent angling and the great beauty at this lake soon caused many other boats to be placed there. Several cottages were built, and fishermen from Adrian, Toledo and Tecumseh spent much of the summers there with their families and the fish. The lake is one mile wide and about two miles long. The Lake Shore Railroad station of Pentecost, an hour's ride by rail from Toledo, is two miles away. The cottages are grouped in "colonies." William Todd and Thomas Bennett, of Chicago, are neighbors of Judge Howell, of Detroit, and John McKenzie, of Cleveland. The Dewey family and Ira Mason, of Toledo, live there through all the summer months. Adrian people are represented by Robert Moreland, E. L. Baker, C. S. Whitney, J. H. Reynolds, Mrs. J. G. Mason, A. F. Wood, and H. V. C. Hart. Walter Doan and W. Hutton, from Richmond, Ind., are also prominent cottagers.

And the astonishing feature of the fishing is that every angler, even one with crude tackle, no skill, and with

WEST SIDE OF MONIGAN'S COVE, SAND LAKE.

only earth-worms for bait, is sure of a good catch of rock bass, sunfish, bluegills and perch. And there is always the chance that a large black bass will add special excitement (and probable disappointment as he escapes) to the fisherman's day. This is remarkable, when it is remembered that the lake now has nearly a hundred boats around its shores, and that a dozen boats are fished from daily all summer. The black bass fishing is far less good than in those early years, although more of those fish can be taken there even yet than in any one of the other thirty lakes of the Prospect Region. One reason for this is that the State Fish Commission keeps that special lake exceptionally well stocked with fry. Yet the fisherman will have to be satisfied on many days with the pan fish, the rare beauty, and the exquisite sense of being with the best of earth—air, sky, and water, foliage, birds, wild-flowers, and water-lilies. For the black bass is skittish, shy, and uncertain, a queer, burly water-pirate who will swim about your boat and let you see him just to tantalize you into casting your hook over him. Then he will open that ample mouth and laugh at you, and go off for a swim, leaving you heart-sick and disconsolate. But on other days or hours he will rush to his doom at almost any lure. I have seen a pair of spectacles that, according to proof

that amounts to a demonstration, were once swallowed by a black bass. For a short time the fisherman may have the best of sport, and presto! a change of wind, a clearing of cloudy sky, or for some cause not seen or known, the biting stops as suddenly as the end of a line. And that very uncertainty is a large contributor to the delight of angling for this fish; you always are expecting a strike from a monster.

My own "luck" there has often been such that I hesitate to give its details here, and so I seek refuge in the following facts as furnished to me by "Gil" Kennedy, of the North Shore Hotel at the lake. The fish were taken during the last summer:

James P. Lock, of Toledo, captured nine small-mouth black bass in one hour, casting a phantom minnow with a five-foot steel rod. Gaston Mitchell of Toledo, landed fourteen bass weighing from one and one-half to three and three-quarter pounds each. He used frogs for bait, casting into the bulrushes and lily-pads at the edge of deep water. Walter Doan, of Richmond, took many bass, his best luck being a fish of four and a quarter pounds. He used large frogs for bait, with sixty feet of line, and let the boat drift in the wind over deep water. Miss Annie McKenzie, of Cleveland, took five bass in thirty minutes, trolling with a small spinning hook. The fish are there!

The surface of Sand Lake is 370 feet above the mean water level of Lake Erie at Toledo. This unusual elevation for Southern Michigan, and the steady southwest wind over and through the hills and valleys, make camping and angling on those wooded bluffs free from heat in midsummer. The shores must be seen to be appreciated. Dense forest, pretty coves, the exceptional clearness and coldness of the water (making it good for drinking purposes the year around), the gravelly bottoms and the fine fishing, surely that is a list of attractions!

And one is sure to meet exceptionally hospitable and friendly campers and brother anglers. No cottage but will welcome a sportsman to a chair on the little porch; no camper but will invite him to take a stool beside or in the tent, and drink the lemonade or smoke the companionable cigar. And one may go there empty-handed and still the old landing-keeper, Silas Herbert, will supply him with a good boat, fishing tackle and bait, at prices that, to Eastern anglers, will seem ridiculously cheap. The lake has no visible outlet; but there is a general belief that it has an underground outlet into Evans Lake. The heavy timber is on the north and south bluffs. The cottages are all shaded by oak trees. And how pretty the lights from them look at night! A row there in moonlight, with mandolin and guitar music coming from several other boats while the steady southwest wind crinkles the water's surface in unison with the sough and rustle from the tops of the huge oaks, is quite as fascinating as the joys of a night on a remote Newfoundland stream, or a tenting experience or canoe-run on some angling water of a Maine wilderness.

Sand Lake is accessible, and is in touch with the mails, telephones, and the wires of the telegraph companies. The man who takes a canoe there and wishes to sleep under it, can have his meals served or his own rude cooking outfit supplied with the best of meats and vegetables right at hand.

Some effort has been made to secure authentic facts about the later Indian history of that region. It is surprising how little is known or published, or even exists in manuscript form, in regard to even the latest Indian life there. The professors of history in several Michigan colleges, including the University of Michigan, have been asked for this information in vain. It does not really exist; and while they can tell of Caesar and Pompey, of Lycurgus and Antipater, and swamp you with dull facts about the Norman Invasion, or the Merovingian Kings, and put you to sleep with tales of wars and lives back to thousands of years before the Christian era, they plead ignorance as to the history of the Indians who lived not a hundred years ago right where those colleges dispense learning. A few apocryphal "legends" and absurd "traditions" float about, and get into the summer books of some of the railroads, or are exploited in the picnic speeches of the region; but real facts are wanting. There are virtually no books on that subject, and the Indian history of Southern Michigan will never be known. But when Mr. Charles F. Dewey, who yet lives in Cambridge, a few miles north of Sand Lake, settled there in 1828, there was a large Indian camp at Wolf Lake, a mile and a half to the east. Mr. Dewey knew Baw Beese, the chief after whom Baw Beese Lake, near Hillsdale, was named; and Siam, that lazy old dignitary who knew how to look dignified even in his dirty dress and surprising decorations of feathers. Detailed mention of the dwellers in that Indian village, and of their religion, dress, burial-places, corn-fields, weapons, tepees, trails, and methods of fishing and hunting, and of their marriage and death rites, is reserved for mention in a future issue of FOREST AND STREAM.

Numerous arrow heads, stone fish-hooks, battle axes and spears, and even mortars and pestles and drills of the earlier people that preceded the Indians, have been found in the hills around Sand Lake. One, a genuine Stone Age tool that was called an arrow head, but was really an ancient knife, I saw in the small collection of Dr. Joe Welch, of Hudson, twenty years ago. It was exquisitely fashioned, full of amber and gold tints when held to the light to see the moss agate formations running through it. And in the same collection were two of the "hammer-stones" with which those prehistoric people fashioned their tools from rock. The "pits" could be seen plainly, worn deep where the stones had been grasped by long vanished thumbs and fore-fingers.

Other stone weapons and utensils show from their special formation that they were fashioned by the Indians themselves, hundreds of years later. But the subject is so obscure, and such faint gleams of light come to the student, that only general mention of the subject is made here. The lack of interest in the matter, the apathy not only of the resident population, but of the county and State officers, is surprising. For example, the writer spent the first twenty years of his life in a house located seven miles north of Hudson, in the Devil's Lake and Prospect Hill region. At the "four corners" formed by two busy country highways, and not twenty rods from that house, stood the horny, barkless shell of a black walnut stump—huge, obscure, unnoticed—its location in a fence-corner

having always "saved" it from being uprooted and burned. It was not "in the way" of the plow or scythe, the cradle of the wheat gatherer, or the wagon of the highways. Not one in ten thousand of the men who passed it within a few feet ever even noticed it. Yet it was the stump of a tree felled by the Indians before the year 1800, and long before the State was "thrown open" for settlement. The man who "took up" that Government land and found the stump there in 1834, was told by a Wyandotte Indian that the tree whose rotting body the settler was cutting into logs to place in the heap and burn as the land was cleared, had once been a noble "bee-tree," and the Indian said, "Got much honey!"

Some traces of that stump must be there yet. The penholder used in writing this article here in New York city was made from a fragment chopped from the root of that stump twenty years ago. Yet, I repeat, not five men of the hundreds of thousands who passed it, knew or cared for its history. People were too busy and full of planning for the immediate future, to waste time about the past. So the stump was only prized by the boys at the district school twenty rods west of the cross roads; for it was large and hollow, furnishing a good hiding place while they played "high-spy;" and it was also attractive to them because around its roots were "dangerous" bumblebee nests; and because a sturdy and often raided patch of daisies flourished around it, as if the very flowers came there to do honor to the neglected, decaying base of what had been a great monarch of the Michigan woods.

L. F. BROWN.

A Day in Nebraska.

WITH each passing hour now, in these early October days, come multiplying evidences of summer's decay and the advance of the wintry season. We have already had a number of hard frosts, and the aspect of things generally is such as to justify the belief in an early closing in of Old Crimp and his hoary hosts. The wildfowl have already arrived in goodly numbers, not only woodducks, spoonbill, and teal, but mallards, canvasback, redhead, widgeon, and pintail, and from this on to the freeze-up the sport will be fast and furious. The jacksnipe shooting has not been so fine, with the exception of last spring, for a good many years, and a few hours' gunning on almost any of the nearby low lands is the assurance of a good bag of this morceau of all feathered game. The geese are flying, too, and only last night, while strolling out Farman street, that familiar old cry, *Auh-unck! auh-unck!* came floating down from high up in the steely sky, and looking up I saw a long line of Canadas south. There were about sixty of them, as nearly as I could make out, and their extreme height made it evident that they had come from a far distant land. The sight thrilled me just as if it was the first line of geese I had ever seen. Why is it that the honk of this long, white-collared raucous throat always stirs our blood? Does it arouse the savagery that still lies dormant in most of us? John Burroughs once said: "I hurry out of doors when I hear the clarion of the wild gander; his comrade in my heart sends back the call."

So at last the sportsman's gala time has arrived. The numerous canvas-clad rubber-booted men who are to be seen on every outgoing and incoming train would alone be sufficient proof of this. But I have it stronger still, for I was out myself Saturday and Sunday, and had one of the greatest shoots on bluewing teal that ever fell my way before. Together with Charles L. Thomas, I was the guest of Henry and Jake Carson—direct descendants from old Kit—out at Fairmont, and to detail the trip would be to tax severely the credulity of the average reader. Two hundred bluewings in two days and we could have made it five hundred.

Without a doubt this is the greatest fall for bluewing teal ever known in this section of the country, and every ducking ground in the State has fairly swarmed with them. Nothing like their plentifulness, the oldest and most experienced gunners say, has been known here since the earliest settlement of the State, and were it within the scope of law and conscience too a day to a single gun would be anything but an extraordinary exploit.

Anas discors, as he is known to the wise men, is a royal little fellow wherever found, and with us here, as I remarked in a previous article in FOREST AND STREAM, he is the avant courier of all his kind that come down to us in the hazy fall days from the breeding coverts in the British Columbias. At the same time there are more teal that breed in this latitude than any others of the wildfowl tribe, and joined in mid-September by the birds from the north, the local contingent early makes a remarkable showing. Blue-wing teal invariably make their first appearance here in any considerable numbers along in the latter part of August, and by the middle of September are here in their greatest numbers. They gather in thousands and thousands along the shores of our marshy prairie lakes, where they sit in the mud, huddled close together, basking for hours in the warm sunshine. They fly swiftly, and when they alight drop down suddenly, like the jacksnipe, among the tules or on the mud. They subsist chiefly on vegetable food and are gluttonish in their greed for the seeds of the pink smart weed, rice and reeds. Their flesh is matchless, and even the northern birds, after a few days upon any of Nebraska's favorable grounds, are as fat as butter. After a repetition of several hard frosts, such as we have been having lately, they get up in a body and hurry southward, being an extremely delicate bird and as susceptible to cold, almost, as the upland plover. The green-wing teal are often found with the blue-wings, but it is generally in small numbers, as they are an entirely different bird. On Sunday last the ten or a dozen shooters who were on the ponds near Fairmont, out of the several hundred birds killed, there were not more than fifteen or twenty green-wings. The fact that so many birds of apparently the same family differ so widely in their habits, their feed, flight, breeding and character of their cries is always a rich subject for speculation, and the observant sportsman is always making his notes and comments. The education of the forest and the stream is a grand one, and it is only the true sportsmen who graduate from this, Nature's school. Take the several kinds of plover and waders, for instance, the snipe, dowitchers, phalaropes, killdeer, gray and red-breasted sandpipers, no two have the same range, the same habits, flight or

cry. With the teal it is the same. The green-wing is a decided polaric individual, while the blue-wing thrives better in the tropics, and while very similar to the casual observer, they are distinctly different in structural conformation, in the markings of their plumage, in diet and habitat. While the blue-wing is the first bird down from the north in the autumn and the last up in the vernal season, it is precisely the opposite with the green-wing. He comes down in the fall with the main issue of the hardier sort, the canvasback, redhead, merganser and bluebill, and up in the spring with the sprig in the boisterous weather of early March, amid sleet and snow and cold and rain. The blue-wing is a delicate, vulnerable little creature and easily killed or knocked down, while the green-wing is hard as rubber, tenacious to life, and most difficult to stop, and, if but wing-tipped, might as well be given up as lost.

Along from the middle of September up to the present time, the blue-wing out here affords the best and easiest kind of shooting, especially the young birds, which lack almost wholly the cunning and wariness of the old birds, and offer ready prey to even the half concealed gunner. Like the jacksnipe, in most instances, a single No. 7 or 8 pellet is all that is necessary to drop them out of the air, and once down they quickly give up and are comparatively easy to retrieve. They are full of play, and love to gambol and cavort in the low shallow waters or in the open, until long in the morning, leaving for the feeding fields along between 9 and 11 o'clock, and returning to the ponds and marshes from 3 until the sun crimson deeply the western skies.

The morning in question dawned gray and threatening, and along about 7 o'clock the rain began to fall by the bucketful, and continued until 9 o'clock, when, with Henry and Jake Carson, Thomas and I pulled out from the hotel for the sunken meadows north of the town. The heavens were ragged with flying scud, and the prospects for more rain were good, indeed, but good fortune was with us, and we did not get it.

I must confess I was exceedingly dubious about finding any duck shooting in that magnificent agricultural region, with its handsome modern homes, big red barns, its limitless fields of gigantic corn, wheat stubble, alfalfa and clover fields, and, much to the amusement of the Carsons, I inadvertently eloquently upon the veracity of some people when telegraphing their city cousins about the enormous duck shooting they were having in the country.

We had traveled a couple of miles or so and were bowling along the sloping highway, between two broad catalpa-bordered pasture fields, bound for the Ayleshire Pond, when my attention was engrossed with the hundreds of turtle doves that were constantly in sight. They were feeding all over the closely cropped fields, darting through the humid air on whistling wings, and perched in rows along the board fences, drying their feathers and preening themselves after the downpour, and the exhibition was entirely too much for my sensitive nerves. I had little hope of any duck shooting, as I said before. We hadn't seen a feather in the air, and being well posted as to the savory qualities of the broiled turtle dove, and being determined to bag a mess of some kind of game before going home, I urged Henry to pull up and allow us to take a crack at them, remarking at the same time that their blue-winged teal were in all probability the creatures of an overzealous brain.

"We'll find the blue-wings thicker than you ever saw blackbirds," indifferently ventured Henry, but, ever obliging, he turned into the fence and brought the team to a halt, and tossing the lines to Jake, he and I got out, climbed over the fence, and began hostilities on the doves, while the wagon followed us slowly down the road.

We had almost reached the end of the field, which batted into one of those oceans of standing corn so plentiful in Nebraska, and were plodding up over a considerable of a knoll, when a cloud of birds, with outstretched necks and whizzing wings, came hurtling out of space into our very faces. I was so startled that I did not recognize those glancing drab shapes, when crack went the first barrel of Henry's Parker, and crack went the second, and as five azure-winged birds came tumbling and gyrating down into the drying clover and blue grass stubble, I saw that they were teal, and, as with the velocity of a fleeting shadow, they swept over the corn's whispering tassels, I banged away—both barrels—at their vanishing shapes. Not a single cerulean wisp, not a single drab feather, responded to my frenzied shots, and you can imagine my chagrin as I picked up a couple of Henry's birds, looked at them critically, then gazed off wistfully over the waving corn in the direction the flock had fled in the hope that they would return. But they did not, and picking up the remaining three birds I carried them by their pale yellow legs out of the pasture and up to the wagon without uttering a single monosyllable.

"What do they call that disease that always catches those green hunters, Jake?" inquired Thomas, as I handed him Henry's birds, and climbed up into the seat beside him. "Oh, yes, the buck fever—that's it. But no fever will ever feaze Sandy. You'll have to use an ax to do that. However, that was a corking good shot you made, Gris. What! you didn't shoot? Well, what are you doing with these birds then?"

I was impregnable to Thomas' facetious assault, but there is no telling what a burst of oratory he might have evoked had we not, at this moment, reached the top of a slight rise in the road that gave us a birdseye view of a grand expanse of that lovely country.

"Look there!"

And Henry pulled the team to a standstill, and, rising to his feet, pointed off to the northeast with his whip, and together we all caught sight of thousands—millions, it seemed—of flying birds. What were they? Why, blue-wing teal, to be sure! In great rising and falling flocks, one after another, again, again, and again they came, until that portion of the heavens was fairly darkened by them. They seemed to come up out of the eastern horizon, and were following each other in one long, ragged, irregular stream over the flowing fields, diagonally with the road we were upon, toward the northwest.

"They are making for the upper pond, Jake," remarked Henry, and plumping into his seat he chirruped to the horses and away we dashed.

The blackish scud had almost vanished, and blue patches—like your sweetheart's eyes—were opening in the sombre firmament, and it was not long ere the full lustre

of the autumn sun was bathing the world in a flood of gold.

And the blue-wing teal. Still they rose and fell, like the billows of some angry sea, flock after flock, bunch after bunch, line after line, all curving in one direction, all on the same errand bent. We soon reached a point where we could see them circling round and round over a low, basin-like excavation in the universal green, and then in sweeping curves settled down with drooping feet and cupped wings, and disappear.

A mile further on Henry swerved to the side of the road and with a "Git out boys," tied the horses to the trunk of a weeping catalpa and otherwise indicated that we had reached the end of our wagon journey.

"Sandy and I will cut across this wheat field here for the lower pond, and Jake, you and Charlie do likewise for Ayleshire's. Now, don't be in a hurry. We've got plenty of time. Take all the shells you can carry, and be careful. In twenty minutes, Mr. Griswold," turning to me, "we will be among them, and I think you will have the laugh on Mr. Thomas before we get through."

And I surely had.

By the time we had crossed the big wet field and reached an elevated point that commanded a view of the lower pond, the scene was one of the most exhilarating I had ever gazed upon.

The thin mists had quite lifted from the little valley, and the sun, shedding his bright rays from amid silvery fragments of floating vapor, sprinkling corn, grass, reed, weed and water as with golden rain; setting the myriads of twittering blackbirds, yellow-hooded and scarlet-winged, in delightful motion, while from the little smartweed covered morass came the muffled sound of countless thousands of feeding teal. The picture was one well calculated to enthrall the sportsman for the year the first time out, and I pulled Henry back by the sleeve of his shooting wammus until, in exquisite rapture, I had drunk it in over and over and over again.

On the other side of the gentle vale there was a grand sweep of waving corn, brown stubble, and broken ground, now laved in alternate lines of dim gray and topaz, swelling up and back from the very verge of the tule-lined and shimmering water. Across the heavens still floated masses of fleecy vapor, fiery-edged, and dropping their lights and shades over the corn, the yellow stubble and the blue bosom of the pond, like the play of color on velvet, while all about October unfurled her flaming banners. A playful breeze came sailing through the tall, tawny grass from the south, and, brushing by us, pounced upon the open stretches of water, between which the birds were working like writhing vermin, streaking the surface into ripples, fanning the cattails with its delicate wings and then melting away in the distant cornfields.

SANDY GRISWOLD.

OMAHA.

A Summer Shower.

WHAT matter if you have a day's fishing on Croton Point Reef spoiled by a thunder shower? There are other days for fishing, plenty of them; so this time, instead of stowing away your tackle and making posthaste for home two miles distant, in a vain attempt to distance the storm, you pull your boat well up on the beach and take a comfortable position on the bluff overlooking Haverstraw Bay. You are here to analyze this storm, to study its moods. You have heretofore viewed them with feelings akin to fear, not fear of physical harm that might result, but with indescribable mental forebodings. Enough. Attention! The play is on.

The air becomes still and sultry. The sun, which has been shining all day with intense brilliancy from a cloudless sky, becomes slightly obscured by a damp mist which cannot be seen, but nevertheless is a tangible reality. The sun's disk, which but a few moments ago could not have been seen, owing to the intense glare of the radiated light, is now shorn of its power, and, like a drouth-moon, can be gazed at with impunity.

The air is surcharged with electricity, the fact of which has been apparent since the mist-softening of the sun, which, as it thickens, can only be likened to heat converted directly into electricity—electricity which smothers and depresses. Banks of clouds—thunder heads black at the base and capped with white, like gigantic cotton-balls, begin to steal up from the western horizon—faithful sentinels of the heavens which have done service since the world began.

Up and up they steal till the orb of day, no longer glorious, succumbs to their obscuring density. Then, from the apex of the crown of vapor, in seeming response to the lurid sheets of lightning which intermittently flash from the center of the purple blackness of the mass—fleecy scudding clouds, like warriors of old on white chargers, dart out from the ranks of their massed allies and go careening across the sky. A few drops of rain patter in the dust of the road and cease—harmless missiles for which, however, the advance guards of the sky have given up their existence.

Our mental and bodily sensations, heretofore of oppression, give way to feelings of awe at the grandeur of the spectacle. The mountains, which, up to this point, have stood out boldly, seem suddenly to have shrunk in size. The many familiar points and spurs of prominence are withdrawn into the general outline of hazy shadow, dark and forbidding. A bright flash of lightning streaks across the sky, closely followed by a mighty crash of heaven's diapason which makes the very foundations of the earth tremble.

Suddenly, from the murky cloud bank which has melted to a gray color, low flying feathery clouds laden with moisture separate from the parent cloud, to be disintegrated by the cutting north wind, falling to the earth only to be reinforced by more, which, in turn are smitten and precipitated, till finally the roaring of the millions of hosts of rain drops can be heard beating the river and shore as the storm advances toward the spot on which you stand entranced.

Reluctantly you seek shelter, and none too soon, for the play of the storm is about you—the beautiful scenery is blotted out by a gray pall of swirling clouds and pelting rain. Ever and anon the obscured landscape is relieved by bright flashes of lightning, the magic touch of which clears the mist, and for the moment restores its beauties.

As you witness the light of God's mighty torch clearing

the darkness, you can faintly conceive of the glory of His infinite power.

The sun suddenly penetrates the clouds and shines out anew; awe turns to gladness as the once more glorious orb of day dispels the mists.

These sublime manipulations of His power and might dispel doubts and fears from our hearts. As we go out in the revivifying air where all nature rejoices, higher thoughts possess us, and wonder that there are those that say "There is no God."

CHAS. G. BLANDFORD.

Col. E. B. Stoddard.

HIGH up in the necrology of the year will appear the name of Hon. Elijah B. Stoddard of Worcester, Mass. More than seven years had been added to the three score and ten years of the Psalmist before the summons came to him at Kittery Point, Maine, whither he had gone to appear as counsel before the Supreme Court of that State.

He was born June 5, 1826, in the town of Upton, near the city in which all the years of his active life was spent, and in which he attained distinguished eminence. After completing his classical studies at Brown University, where he was graduated with the class of 1847, he studied law in Worcester with some of the most distinguished legal lights of the time, and was soon after admitted to the bar. The question of slavery was then paramount in the country, and his natural kindness of heart prompted him to join with others to relieve the down-trodden and oppressed, and to remove the foul blot from the escutcheon of fair Columbia. The Free Soil party was the result, and in this he took prominent part and became a trusted leader. Having once entered public life, station and honors came rapidly to him unsought, and during all the years of his long life he was prominently identified with the political, intellectual and business life and development of the city and State. He was called upon to serve the city as councilman, alderman and mayor, upon important committees of finance, education, and in many other ways; the State as Representative, Senator, and member of the State Board of Education for more than twenty-five years; and the business world as a director of different railroads, president of a national bank, of a savings bank, of a fire insurance company, and in many other ways. He was a man of dignity and commanding presence, a man of sterling worth, in whose breast beat a kindly, sympathetic heart, a man whose counsel was much sought and highly valued.

But it is as a sportsman that his life will be of most interest to readers of *FOREST AND STREAM*. It has been the writer's good fortune to have enjoyed the friendship of Col. Stoddard for a span of time not measured by a generation of years; to have tramped with him beside the rippling trout brooks in early spring; to have given pursuit to the wary grouse upon the hillside in the hazy sunshine of the Indian summer; to have shared the mid-day lunch when no manufactured relish was needed to render it palatable or to stimulate the appetite; and to no man can I give greater praise for all the qualities that go to make up the gentleman and ideal sportsman. His was not the ambition to destroy all that he could; the fascinations of the purling brook, the flowers of spring, the song of birds, the tree-covered hill top, the distant landscape, the fleecy clouds and golden sunsets were more to him than a well filled creel or plethora game-bag. Along quiet lines during a long term of years he, together with a few congenial spirits, spent time and money to restock streams and coverts. Nor did he seek for approbation or praise for such good work in the columns of the press, as is now too painfully evident, offensive and injurious. He was also prominent in securing helpful game legislation and the establishment of the State fish hatchery at Whitinsville was due to his efforts and those of two others. By the death of Col. Stoddard the guild of American sportsmen has sustained a great loss, and it is a sad satisfaction to one in the humble ranks of the brotherhood to place this chaplet upon his new made grave.

WORCESTER, MASS.

GEO. McALEER.

Destitution at Eustis.

NEW YORK, Sept. 22.—*Editor Forest and Stream:* The many readers of your paper who have fished and hunted in the Dead River region of Maine will be shocked to hear that the village of Eustis was almost completely destroyed by fire on Friday, Sept. 11. The fire broke out in the afternoon, and in one hour and a half but fourteen buildings remained standing, fifty-four, including stables, barns, etc., being not merely in ruins but absolutely swept off the earth. The inhabitants are homeless, and the fire having spread with such rapidity that the contents of the houses could not be saved, they are all—men, women and children—left as regards clothing, with what they stand up in. Any donations of money or clothing contributed by any sportsman who has pleasant recollections of summer and fall days spent in the Maine woods with one of the well-known Eustis guides, will be gladly received and placed where they will do the most good by Mr. Miles Wyman, the postmaster, and as the cold weather is coming on apace, let any one who wishes to help these stricken people remember that He gives twice who gives quickly.

CHARLES J. B. BELL.

That Maine Summer Deer Killing.

BROOKLYN, N. Y., September 23.—*Editor Forest and Stream:* In last week's *FOREST AND STREAM* I see my name mentioned under the heading "Maine Summer Deer Killers Fined." I wish to make a positive denial of the accusation there stated, as well as the insinuation of the game warden that I was "probably" after venison.

C. B. PARKER.

New Hampshire Shooting.

DERRY, N. H., September 17.—The hunting season has opened with a very poor prospect for ruffed grouse shooting. The three weeks' continuous rains killed about all of the young birds. Woodcock seems to be well reported. No nuts for the squirrels, and the corn crop will make poor feeding for the raccoons.

J. W. BABBITT.

Natural History.

Bird Jottings.

From a Convalescent's Point of View.

SEPT. 11.—A friend—a lover of the countryside—called on me to-day and told me that while out driving yesterday he saw a flock of over fifty high-holes, all large, handsome, full-grown birds. Such an extraordinary gathering of high-holes must have been indeed a very interesting sight, enough to excite any bird lover. If I were able I'd be tempted to walk many a mile to witness a similar flight. With the high-hole are associated the care-free days of boyhood, with enchanting glints of meadow and woodside pictures, hence when I heard the joyous cackle of one of these great rollicking fellows in a tree close to my bedroom the other morning, I quickly arose and opened the blinds to let in the sunshine; I imagined myself well and strong; the wooded hills looked near and inviting.

I have noticed lately that the English sparrow has acquired quite a taste for the juice of my rare-ripe German prunes, which are daily growing sweeter and juicier under the hot September sunshine. But for such tippling he is not the artist that the Baltimore oriole is, who has acquired his art by long practice. The latter, with his needle-like bill, makes only a tiny puncture, but the sparrow makes but sorry work of it. He jabs clumsily at the fruit, which invariably loosens from the stem and falls before that short, thick bill can even break the skin. But failure does not discourage him, and when he is successful in boring into a prune that holds on more tenaciously than others, he seems to enjoy his sweet tippie immensely. Such fruit shows quite a hole and may as well be left now for the eager honey bees and hornets. The oriole operated chiefly on my large red Japanese plums. Morning after morning I took my stand in a certain place to watch him. Approaching the well-laden tree in little journeys from a dense mass of elder bushes close by, he cast his eyes about, no doubt to see where the largest and ripest plums could be reached to the best advantage. Then he would calmly, deliberately, and fearlessly "tap" first this one and then that one to get the different flavors, no doubt, like any true connoisseur. It was sip, sip, sip. Just a nice pleasant tippie, and just plain plum juice, but sweet and syrupy. My, how delicious it was! Nothing to equal it—in his estimation. At least his actions caused these reflections as I eagerly watched his every movement. I know this, that he enjoyed his little "speer," and immensely at that. It did me a great deal of good to see him, and I wouldn't have harmed him for the world. I was deprived by a stern decree of eating the fruit, why couldn't the oriole just as well take my place? After the third of September I missed my gayly-attired visitor, and for all his faults I regret his departure.

I was almost afraid that the season would slip by without me catching a glimpse of even a single cuckoo. But a stealthy, flitting form attracted me to the elder thicket one morning, and peering to the right and left, in his shy, fearsome way, was the object of my concern, the black-billed. I feasted my eyes for a moment on the large, slim, pigeon-shaped, brownish-olive bird before me, when he detected me. Then how he did shrink into himself for very shyness! I am tempted to say that the cuckoo is a sort of Thoreau among birds—a shy, solitary creature. John Burroughs says: "He is like the showy orchis, or the ladies'-slipper, or the shooting star among plants—a stranger to all but the few."

A bit of the woods and fields is now and then brought to my very door. For instance, the meadow lark the other day that thought he would make a venture to fresh fields, and when I saw him fly past the garden bound in a northern direction, he was already wavering considerably in his flight and did not seem near so confident where he was bound for. Uttering a few of his familiar notes, he presently turned and flew back in the direction of his old haunts, a short distance south. On another occasion, for several successive mornings and frequently throughout the day, I heard the sharp clicking chip of a bird in the trees about the house. It mystified me; I couldn't trace it, and yet I was almost sure that I had heard that note somewhere. Still, here may be a chance also to add a new bird to my list. A few mornings later, while strolling in the garden, I heard the same notes proceeding from a brush pile quite close to me. Cautiously peering through the branches of a small plum tree I saw the bird in the very act of uttering his sharp chip. It was my old friend, the indigo bird, familiar from boyhood. Still, I was very grateful for his presence, and what a message did he not bring from the thickets and woodside? And when such a distinguished visitor as the rose-breasted grosbeak condescended to invade my humble domain that is what I considered one of the red-letter days in my bird calendar. I had merely a fleeting glimpse of his black and white spotted back and rosy breast, and heard his call note, *gimp*, as he flew over, but it was enough. One can't expect to have too much at one time. I have never heard his song, but judging from what Hamilton Gibson says about it, it must be well worth going a long distance to hear. Here is what he says about the song: "Sensuous and suffused with color, it is like a rich, pulpy, luscious pink-cheeked tropic fruit rendered into sound."

The most of my sunflowers have been leveled by violent winds, but those that are left standing have been taken complete possession of by the goldfinches. I take great pleasure in observing them extract the seeds—the males in their fading plumage and the females in their usual sober attire. They go about it so deftly, so prettily, so daintily. Then what endearing little small talk is passed back and forth between them! One of the early morning sounds these days is his exquisite *bay-bee*, varied with *perchickopee*, as he flies from one wild lettuce stalk to another, and then he occasionally indulges in a pleasing

little song. It is a pleasing reflection that the goldfinch stays with us throughout the winter.

Another bird that tastes of the sunflower seeds occasionally is the white-breasted nuthatch, whose nasal *yak, yak, yak*, I frequently hear at dawn. But my two old apple trees are the main attraction. These are the shrines at which he daily worships, much to the consternation, no doubt, of the life under their rough, scaly bark. What an inexhaustible larder these old trees hold for the birds that make this their "banquet table!" The little downy woodpecker is the most frequent visitor, but the hairy looks that way also, likewise the chickadees, and rarely the little brown tree creeper. Later on I'll keep a sharp lookout for the kinglets and myrtle warblers that seldom fail to make the old trees a passing visit.

Sept. 15.—These mid-September mornings are of those golden qualities that revive latent fires in the birds. On this particular morning the robins gave us delightful bits from their rich June chorus, there was also the delicious warble of the bluebirds, the sprightly singing of goldfinches, the humble trilling of the hairbird, to which the purple grackle added his harsh notes, and the downy woodpecker his shrill clarion.

The bluebird's autumn note, in which is strangely intermingled sweetness, tenderness, sadness and plaintiveness, is as artistic a bit of melody as the bird's delicious spring warble. To me it is the saddest bird note of autumn. As it gently falls down to us from the sky I cannot associate it with anything but a refrain of the passing season—a little dirge to autumn's passing loveliness. It also means "good-by."

THEODORE M. SCHLICK.

DANVILLE, N. Y., Sept. 16.

A Little Unprofitable Essay in Speculative Ornithology.

Editor Forest and Stream:

I must confess myself very much interested and somewhat puzzled by Forked Deer's account, in your last issue, of the "apple-birds," and am appealing for more light. It would be of great interest to me to get fuller and authentic information about this bird, together with the head of one of the rascals "taken in the act."

So far from discrediting Forked Deer's statement, it is just what I have been expecting to hear from some of those western woodpeckers for some years. Nevertheless in the description of the bird some mistake must have crept in—a slip of the pen, such as we all make, a blunder by the compositor, which we all know is infrequent, or a clear case of trusting to a treacherous memory instead of taking the trouble to write it down—which is a fault I lament myself more often than either of the others. In one of these ways Forked Deer has brought it about that his description does not fit any woodpecker in this country—and, it might be said, would be very hard to attach to any other bird. "The size of a robin;" "back and wings perfectly black;" "a band of light brick color about an inch wide from the throat to the tail;" "a circle of the same color about the eyes;" "a habit of lighting upon the side of posts"—which in itself, I may say, is, taken with its size, undoubted proof that the bird was a woodpecker. But the color, which I quote, not in ridicule of an honest attempt to describe the bird, but to prevent secondary misapprehensions, is not that of any known woodpecker in any plumage familiar to me. Within the hour, to refresh my memory, I have examined an extensive collection, including specimens of every species found in North America, and there is nothing which at all resembles this bird. I am a little more discourteous in pressing this point because a narrow stripe of color from throat to tail continuously (if throat is taken as meaning the whole tract to the bill) is so unusual a color pattern and so had protectively that any bird possessing it should be very easily singled out from even a multitude, whereas of the woodpeckers we have but about twenty-five species to work upon.

Assuming, then, for purposes of discussion, that there has been some discrepancy which prevents certain identification of the species without involving doubt as to the account given of its habits, the question at once becomes more intricate and more interesting. What bird would be most likely to take up this habit of robbing the orchard? And what one corresponds most nearly to the description?

To the first question I suspect that the editorial conjecture of Lewis's woodpecker is correct. It would be the safest guess if one were reduced to guessing. The weight of other hypotheses and already collected information lies behind it. And it seems to suit the peculiar genius of the bird.

On the other hand, Lewis's woodpecker in no particular answers to the description of this bird. In bulk and spread, even if not in actual inches, it is a much larger bird than a robin. It has not a trace of "light brick color" upon it whether that color be buff or brownish-red; its pink is a decided pink, and its crimson is a deep winey color. This crimson does envelop the eyes, but not as a "faint circle." Finally the bird has not a stripe nor the suggestion of a stripe upon it. Its coloration is almost unique among the woodpeckers upon just that point. The casual observer would be most likely to remember the rich crimson around the eyes and throat (red being a color which impresses itself for psychological reasons), and the curious gray crescent upon the back because that is an unusual mark. But one could hardly by any means carry off an impression of stripes from a bird which has none, though heaven and the ornithologist only know what funny descriptions are sometimes given of birds "in the bush."

But does this go to show that the Lewis's woodpecker was *not* the bird that did the damage? I incline to think not, merely that it could hardly have been the *bird killed*. The strongest evidence in favor of Lewis's not being the depredator is that Forked Deer expressly states that the birds were fall migrants, appearing suddenly in large numbers (from the south, he says, which must be just a slip of the pen, since there is but one bird known, the Ross's rosy gull, which does not head toward the south in autumn)—and then vanishing suddenly. Now, the

Game Bag and Gun.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Maine and its Game.

BANGOR, Maine, September 26.—*Editor Forest and Stream:* The outlook for game in Maine for the fall that is now on us, or will be in a few days more, is better than it has been for years. This is due in a large measure to the unusually dry spell in the early summer, when the chicks of the partridges were given a chance to grow without the drawbacks that always accompany wet summers. It has been cold, to be sure, but the mother partridge has been able to keep her chicks warm, and the birds have thriven in every part of Maine, according to report. Consequently there will be more birds to shoot and eat in camp this season than before, which is an advantage in varying the frequent venison diet of the hunter. This is cheer to the bird gunners, and the fact that woodcock have also seemed to summer well adds to their joys, and they are proving the truth of the reports by coming home with some birds about every trip into the outlying covers, although the days of the big bags appear gone from Maine covers forever. The hard time for the birds, that is, in those covers reached from the cities, is Sunday, when it seems as if there was a gunner for about every bird abroad. This in spite of the law making Sunday a close time, a law which is better observed by those who don't like partridge stew than by those who claim that their weekday duties give them license to break the law on "the only day they have until their fall vacation." The fact that no birds can be sold in Maine markets has killed very largely the nefarious work of the market hunters, although there are still a few who will bear close watching. With this restriction added to the efforts made to enforce the bird law, there seems to be considerable hope for the grouse and woodcock, which a few years ago seemed doomed to annihilation.

On Thursday next, the first day of October, the Maine law will be removed from deer, and on and after that date men may kill the biggest deer they can find, and another to match it before they exceed the limit, unless, indeed, they make a mistake and shoot a smaller one, which in ninety-nine cases out of a hundred will be the case. The big deer shot in Maine in the early days of the season are not very numerous, although, of course, some lucky hunter occasionally gets a bouncer. Most of the really tremendous deer—deer weighing from 275 to 300 pounds or more—are shot after the November winds have swept off the remaining leaves, and the largest bucks have forsaken the high, hardwood ridges. And some have been killed then of immense size, almost as large as some of the moose so proudly expressed to admiring home friends, and far more attractive in antlers. The writer has seen a buck deer that weighed, eight days after it was killed, 308 pounds, dressed as usual for shipping.

There is not likely to be the rush for the woods that once characterized the Maine non-resident hunters on and before the first day of the deer season. There was a time when the trains, from September 15 to October 15, carried an average of over a hundred hunters a trip to be on hand and get the early and—to the novice—biggest and best deer. It is no longer so, for they have learned wisdom from experience, and now there is comparatively little rush until the second week, when the moose hunters appear in swarms, filling the sleeping cars to overflowing and making the trains look like trains used in war times, with guns and rifles at every window. The warmer days of early October are not so good for getting game home fresh, although under the new license law one may send his game on ahead as soon as shot, and follow at his leisure when he has finished his outing. This will undoubtedly make quite a difference in a hunter's ability to get his game home in good condition, which some have found to their sorrow is not always feasible, even in colder weather than October.

Hunters come into Maine this year, too, under radically different conditions from those which have confronted them in previous seasons. Under the new license law they are compelled—unless residents of Maine, "actually domiciled therein," as the statute reads—to buy a license before they can enter the woods to hunt deer or moose, and the law covers both, one license serving to grant all the privileges which the Maine law permits the hunter of big game. Shore gunners who want to try the birds in certain coast sections, generally speaking those portions of the coast between Portland and western Penobscot Bay, must pay for a license for their fun, too. In a published interview, Mr. Carleton, of the Game Commission, is quoted to-day as saying that of 133,000 seekers after game, fish and recreation, who came into Maine last year, but 800 came here to hunt big game. If that is so, and he must have been misquoted, then those 800 got a lot more than their share, for I myself counted shipments of 1,800 or more deer through Bangor last fall to points beyond the limits of the State of Maine. And if the average of one deer to a hunter holds good, then 1,800 were in this part of Maine alone to hunt big game. The new license will, they claim, and undoubtedly with reason, give opportunity to know just how many come into Maine to hunt big game. But of the hundreds who never will come here again because of what they regard as unjust discrimination, the Maine public will probably never hear accurately.

Some of the guides and camp owners are hoping that the new law will not have such a deterrent effect upon new hunters as it has upon those who are old visitors, for many of these old friends have cancelled their dates in Maine. Where they have gone worries the guide not a bit—but he must look up a new line of customers. The chance of smaller business, against an already greatly shortened season from what once prevailed, has led the guides in some sections to discuss the feasibility of in-

has an appetite just as insatiable which he is satisfying in large part off from the farmer's natural enemies. No commission of forestry is going to do a fraction of the work that the poor unpaid woodpecker is doing. He works early and late and he works hard and he gets curses for the little harm he does—not small to one man, of course, at times, and not to be endured too patiently even by the most forgiving—but, taking private ownership out of the question, very little indeed to the aggregate of work performed for the public benefit.

FANNIE HARDY ECKSTORM.

Brewer, Me.

Entertainment for Man and Beast.

EVERY one of the half dozen popular magazines contains at least one story of which the hero is beast, bird, or fish. Mr. John Burroughs's protest in behalf of his dumb friends, in the Atlantic, has passed unheeded. A whole school of writers keeps step with the "Jungle Book" man, or struggles along the trail of the "Sand Hill Stag." A literary tendency is clearly manifest, and we see no reason why it should stop at the terrestrial fauna. The flora is as yet unexploited, and since we have had the tragedy of the brook trout and the pathos of the pachydermata, why not also the miseries of the edible mushrooms, the loves of the lotuses, and the tragedy of a dead beet? Erasmus Darwin and his botanical epic are pretty well forgotten, and the way lies open for a literary adventurer to publish as many short stories as there are leaves in Vallombrosa. Nor need the process stop at the organic creation. Two scientists of our acquaintance only ceased from writing a comedy of the chemical elements because they found (as the British matron had earlier in Darwin's "Loves of the Plants") that the matrimonial complications necessitated by the allegory passed all bounds of morality and availability.

The chemical comedietta was intended for children, and it seems that pretty much all animal stories are planned for the very child-like. For the animal heroes and heroines are strangely unlike any animals that the average reader knows, and amazingly like those characters of the dime novel and Sunday-school book which the adult reader usually scorns. We have tested it high and tested it low. Occasionally a Mr. Jack London strikes the note of veracity, as Mr. Kipling knew how to invest jungle life with poetry, or Mr. Joel Chandler Harris to fill the Bre'r Rabbit stories with shrewd wisdom and exuberant humor. But this is the exception. What may be called the beast tale of periodical literature possesses neither veracity, poetry, wisdom, nor humor. The question, Why do people read these stories? only raises the more impenetrable mystery, Why do people read most of the magazines at all? The answer is possibly that people do not read the magazines, but look at the illustrations; and that the popularity of the new school is simply a tribute to the pencils of Mr. Thompson-Seton, Mr. Heming, Mr. Bull, and others.

But if there is doubt about the demand for sentimentalized quadrupeds, there is no doubt about the supply. We feel, indeed, that the production is too copious and uniform to be the result of individual enterprise, and we suspect in the whole matter the machinations of a syndicate which was first called Seton-Thompson and then, for purposes of reorganization and evasion of the law of copyright, was renamed Thompson-Seton. Upon this hypothesis the recent remarkable flotation of animal stories falls under familiar commercial processes. Imagine a resourceful and unscrupulous syndicate which has gained possession of all the undigested securities of the fiction market. Obviously the whole supply of rejected articles might have been got at a base price. What would the substance of such stories be? Of course, the humdrum pathos and conventional melodrama that lie within the observation and mental range of the writers.

Such an accumulation would appear to be wholly worthless from all points of view. But here is where the genius of our supposititious syndicate comes in. You can always unload a bad stock market security by changing its name and denomination. It would be superfluous, and in the present market conditions unkind, to recall the instances of stocks which have brought better prices every time a consolidation reduced their actual security. Upon this pregnant idea what we may call the Animal Story Trust based its fortunes. One may imagine the process of conversion prior to marketing. A dreary story of the death of an old woman in a country village is to be sold. For old woman read Sheesquagh the Cougar, for village read "bleak, crumbling precipices iridescent with such colors as are only seen under the desert sun," votes the board of directors, and the editors tumble over each other to buy. Again, we imagine the syndicate's blue pencil cancelling the title, "Algernon's Heart Sorrows," and rewriting it, "Plunges of Pete the Cayuse," with the note, "Printer, substitute Pete for Algernon." And the publishers who broke Algernon's creator's heart compete for "Pete" at the top of the market.

Now, it is far easier to expose this method of unloading undigested copy than it is to stop it. We may pity the editors and publishers, we may warn them of the impending depression when the underwriters shall be confronted with unmanageable blocks of manuscripts, and Cuvier shall have been exhausted from cover to cover; but we cannot restrict their right to buy at their own risk. Refusing to read Algernon travestied as Pete is only a partial measure. In fact, no effective protest is possible unless the animals should organize a protective association, and appeal to the humanity of the syndicate. One may imagine a sensible "cayuse" complaining as follows: "What right had you to impute to me disgusting human sentimentalisms? What warrant had you to deprive me of my inborn horse sense and put upon me scarcely human idiocies? If you cannot respect yourselves, gentlemen, at least respect the feelings of a horse of good manners, sound nerves, and sane habits." That such would be the sentiment of the beasts reassembled in Æsopian council there can be no doubt. And, failing their voice, we make the plea of our worthy but silent friends our own.—New York Evening Post.

All communications intended for **FOREST AND STREAM** should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Lewis's woodpecker in that part of Oregon is a summer resident. I have seen it breeding on the Clackamas in the Willamette Valley, so I know it would not be an unknown bird except in autumn, and Major Bendire once sent us a number of their skins taken right at Fort Klamath which answers for the territory Forked Deer is describing. However, there is nothing irreconcilable in supposing that an isolated apple orchard might make a gathering of the clans at the season of fruit harvest and thus call attention to a bird which the casual unobserver would not know existed till it interfered with his crops.

But the reason why I dally so long with a topic which cannot be definitely settled without more evidence, is because that error in description has called up what is to me a very interesting query. Working back on that impression of a bird with a stripe down the under parts from chin to tail, it seems likely that the bird did have something which, remembered after the lapse of time, left the impression of a stripe. Now, narrow stripes down the back are common enough among woodpeckers, for they have a high protective value, blending the bird to the upright furrows of the bark he is on, but of western woodpeckers with anything approaching a definite stripe on the under parts for the whole length, I can think of but one. It is true that one is not easily conjured into the bird described, but he is found in that locality, is a migrant, and might, in some plumages, be said to have black back and wings and dirty yellowish or "light brick-color" stripe along the belly; and, which is important, he is just about the size and weight of a robin.

The bird I refer to is the Williamson's sapsucker, the most curious of our woodpeckers. The mature male is a bird never to be forgotten, so brilliant in color and exquisite in his gloss—jetty black on breast, wings, and upper parts, set off by the clear white of his rump and by white wing and cheek markings, with a narrow strip of most vivid scarlet down the throat and another narrow stripe of the richest yellow from the tail up to the breast, approaching but not joining the scarlet of the throat. The female has no mark in common except the white rump and the yellow in the belly. She is a light brown bird, with black and white barred wings and usually with a black patch on her breast. For years the two were not connected by naturalists, and even so distinguished a naturalist as Dr. Coues described them as different species. The young male resembles his father, but his colors are dull, the red throat is replaced by whitish, and the yellow of the belly is dingy or obscure. He might very easily, in some plumages, give one the impression of a black bird with a light stripe beneath. Critically speaking, he would not answer very closely to Forked Deer's description, but then a young male of Williamson's woodpecker answers so much better than anything else.

Next as to the chances of finding him then and there. He is a shy and solitary bird, living by preference in the deep coniferous forests at a good altitude. In summer they breed at from 5,000 to 9,000 feet, and Major Bendire, who must long remain the greatest ornithological authority on that Klamath region, said that he found them nowhere so abundant as in the vicinity of Crater Lake. In September they begin to come to lower land, preparing for their southward journey, and between the 20th of September and the first part of November he saw them not uncommonly around Fort Klamath. There is therefore every likelihood that Forked Deer picked up a specimen of this usually rare bird.

There is a possibility not to be scouted that he is the bird that did the damage to the fruit, but as Forked Deer does not say that he killed the bird in the act, and from the very nature of the bird itself, I infer that he got the wrong fellow. I think myself that the editor is right in pointing the finger of disapproval at Lewis's woodpecker.

For Lewis's woodpecker belongs to a group of woodpeckers which I have long mistrusted were up to new tricks. Slow and stupid as he appears on his lumbering gait, he is just the bird whom I should expect to ranch out and do some new, quite unlooked for thing. When I found that in Colorado some of them had taken to the habit of shelling and storing acorns in holes, while in California others of them, imitating the California woodpecker, were trying to drive theirs unshelled into crevices made previously by the California woodpecker, I saw that this was a bird which would bear watching. There is evidence enough that he does attack small fruits occasionally, and it is quite in the line of probable development that he should acquire a taste for apples.

Should anyone think it absurd or strange for a woodpecker to eat apples, I will remind them of the cousins of this bird, the red-bellied and the redheaded woodpeckers. In Florida the former has taken up the habit of eating oranges, mostly refuse fruit when last reported, to such extent as to earn the name of "orange sapsucker." And of the redheaded woodpecker of the north I cannot do better than to quote a small portion of Wilson's account of him, one of the classics of ornithology, full of the golden glow of September and the harvest:

"Wherever there is a tree, or trees, of the wild cherry, covered with ripe fruit, there you will see them busy among the branches; and in passing orchards, you may easily know where to find the earliest, sweetest apples, by serving those trees on or near which the redheaded woodpecker is skulking: for he is so excellent a connoisseur in fruit that, wherever an apple or pear is broached to him, it is sure to be the ripest and best flavored. When alarmed, he seizes a capital one by striking his bill deep into it, and bears it off to the woods. When the Indian corn is in its succulent, milky state, he cracks it with great eagerness, opening a passage through numerous folds of the husk, and feeding on it with great voracity."

There was a man who made ornithology into poetry without laboring to do it! Such simple, profitable seeing in the pictures bound up in the words, is the gift of—by Wilson.

If it be asked, as is reasonable, Why might not this be a bird which is damaging the Oregon corn and apples, the answer is decisive: the redheaded woodpecker is not in west of the Rocky Mountains. There are, indeed, so very many woodpeckers in Oregon, so that it is easy to find the sinner. When he is found I would advise you not to shoot him if you can help it, and above all to offer a bounty on his scalp. His appetite is voracious, and he works havoc for a season perhaps among fruit, but remember that all the rest of the year he

creasing the wages per day; but prominent guides have told me within a week that they did not think there would be, or in fact could be, any united or definite action looking to such an advance. Guides are much like other men, unless they form a strict trade union of themselves, they can't control the price of a man's work; and in a previous letter I pointed out how unlikely such a union is in Maine, or, in fact, how difficult it would be to hold 1,800 guides together, each section pulling toward its own region for a long season's work. But the suggestion made, which first appeared in *FOREST AND STREAM*, that a protective association was very likely to be formed, was no idle prophecy, and the guides are growing daily more and more in favor of an association that shall see that their interests are protected at Augusta during the law-making period, at least. In his interview, referred to above, Mr. Carleton stated that the proposed increase of the guides' wages might have a tendency to keep people away, but he didn't think the license would keep away a single sportsman. The fact that dozens and dozens of sportsmen, known personally to the writer as staying away for the very cause that Maine asks them to pay \$15 that they may come here and spend ten times that amount, is proof that all the stay-aways are not influenced by the raise in the guides' wages—a raise yet to be known except in the newspapers. Some of the very people who thus refuse to come to Maine on principle, were formerly in the habit of paying their guides an even five dollars a day, so that the possible increase to four can't be said to have any great influence.

Like many other agitations about the question of wages, it is rarely the first-class guide who does any kicking about his price. As I write I have in mind one of the best guides in Maine: Steady, honest, reliable, does not squander his money in rum, tobacco, and worse, but saves all he can, is willing and always good natured, never complaining because the carry is hard or the distance long between camping places, and he is glad to get his three dollars per day. He told me that he would make about \$800, clear, as his pay for guiding visitors to the Maine woods in 1903. Some guides are very dear at nothing "a day and found," while others are dirt cheap at five dollars a day, seven days in the week. It's one of those questions that settle themselves, and as water is sure to find its level, so the guides are sure, sooner or later, to get "just what is coming to them," which is a bit of slang that completely fits the status of the guide of to-day.

One advantage of the new law that will be appreciated by home-going sportsmen, is that no time need be wasted from the precious lunch time in the Bangor station, since the passing of the game for the non-resident has with it no formalities, and the all-powerful warden with his express list no longer keeps an empty stomach waiting until he finds the name of the owner and endorses his departure for home. The attaching of the tag and shipping the game ends responsibility for the happy hunter, and as a non-resident, who is paying for the protection now being given Maine game, he certainly deserves some extra privileges that the taxable native can't have.

HERBERT W. ROWE.

Life in the Rockies.—III.

(Continued from page 269)

ONE morning the ground was covered with two inches of soft snow, and as Mr. P. intended going to the store soon, distant about forty miles, for a load of supplies, and was anxious to have some meat to take along to trade for such as we needed, he suggested that all hands turn out and spend the day hunting. There was a certain locality where I wanted to go, hoping to find elk, and, like most selfish mortals, I said nothing, but made haste to get my work done, so I might get out ahead of the others and get there first; but a fellow named Butts was of the same mind, and got out ahead of me. I had to go right through this place to get to hunting grounds beyond, and heard him shoot about 100 rods ahead of me. Soon I came to fresh tracks of elk, and then came to where they were when he shot, and saw where a wounded one had turned off by itself, and saw where B. was following it by six-foot strides.

I passed on and entered a large body of green timber, sloping to the north, where the snow would last longer. After going some distance through the woods I found the trail of a band of elk, which was very fresh, and leading straight up toward the top of the mountain. Following on I just reached the top of the mountain where they had gone over on the southern slope to feed on the abundance of rich grass to be found there, when I came to where Mr. P. and his son, with the dog, had found the trail and gone in pursuit, ahead of me.

Of course I wouldn't follow them, and as it was then nine o'clock, and the snow nearly all gone, my chances looked slim, for my strongest point in hunting was always to get on the trail of my game early enough to come up with it while it was feeding, which I have found, as a rule, they usually finish by 9:30 or 10 o'clock in the morning. I started straight down the mountain through the woods, having no definite place in view. When I had gotten down almost to the edge of the green timber, where the snow was entirely gone, and while traveling with much caution, I saw the head of a buck deer, which was lying down about forty yards from me. The timber was very thick, and I could not see anything but its head. Taking careful aim at its head I fired. The timber being thick, the smoke from the rifle hung so heavy that I could see nothing for an instant; when it cleared away I could see just the shoulders of a deer as it stood close where the one had been lying. Supposing it to be the same one, and having the vital spot exposed to my view, I immediately fired again. As soon as the smoke cleared I saw again just a small spot of the shoulder of a deer and fired again, then saw a deer run off through the woods. I ran down to where they had been, and saw the deer that had run off going over a ridge 100 yards away, and knew by its actions it was not hurt. My first thought was that the sights of my gun had been moved, for I knew my aim was not at fault, and I believed there was but the one deer. Going down to the spot where I had first seen the buck's head, I found my buck lying dead, the bullet having entered the side of the head at the buff of the ear, and come out at exactly the corresponding spot on the

other side. Then I looked down through the woods in the direction I had seen the other deer run and saw another one lying dead about twenty-five yards away, and on going down found it to be another buck. I dressed the two and hung them up, then began to investigate to account for my third shot.

By circling around carefully I soon found the fresh track of a deer, which had gone past the one that had fallen, and turned off, going in a different direction from the one I had seen running away. I soon found just one little spot of blood, and about fifty yards away found a third buck lying dead. After getting it hung up I sat down and ate my lunch. I only went a few steps after eating when I saw, several hundred yards away, an elk, and started to get within gunshot of it. After a long and circuitous route, I came near to it and saw it was a cow, and let it go without shooting at it. I made my way slowly toward camp, not caring much whether I got anything more or not.

About four o'clock I met all the other fellows with two pack-horses bringing in the elk which B. was after in the morning. Instead of going with them into camp, as they wanted, I kept on up over the top of the mountain, so that I might look down over the grassy slope, thinking that I might see an antelope, which I thought would complete our assortment of game for the day. Sure enough, I had only gone over the top a few rods when I spied, over the top of a little bluff which I was just passing, an antelope lying down. Quick as thought I dropped down out of sight, and then crawled back to a little rocky knoll where I would be in full view of it. When I got there, and poked my head over the rocks, it had got up and was looking toward me, having, no doubt, had a glimpse of me when I first saw it. Shoving my rifle over the rock I took a quick aim and dropped it in its tracks. This proved to be the record day for numbers of big game killed in all my hunting experience: not that I never had opportunity to kill greater numbers, but because there was no occasion for it.

I frequently had chances to make big killings, where it was not necessary to do so, and am glad to say that I never killed game that I had no use for. I was once out about two miles from the ranch, on horseback hunting for meat. It was at a time when deer were hard to find, and had been without meat for some time, as were also some of my neighbors, who sometimes looked to me for meat when their luck went against them, or when they were too busy with their ranch work to hunt. I had left my horse in Bull Canyon, where there was abundant grass for him to feed upon while I hunted, and had gone half a mile further on, to a point which overlooked the mouth of another canyon about a mile distant, where the three principal streams of that section united, namely: Big Creek, Beaver Creek, and Smokehouse Creek. Being at a point which commanded an extensive view, I sat down on a boulder to scan the surrounding country, as I could overlook both deer and antelope country. Directly I saw a white looking animal moving about in the creek bottom and I soon made out two more, and while watching them to determine what they were, they moved off up the bare side of the mountain leading into the canyon. As they were more than a mile away, I could not tell for certain what they were, but knew it was game of some kind. Going back to my horse, I mounted and went around through a body of green timber until I was within a few hundred yards of the junction of the creeks, where I had seen the game, then dismounted and proceeded on foot.

When I had first sighted the game I was between Beaver and Smokehouse creeks, but had crossed Smokehouse Creek while riding, thus leaving all three of the creeks between me and the game. I had not gone far on foot until I saw the game I was after up in the canyon, and could then see plainly that they were mountain sheep, and that there were about twenty of them in all. I took in the situation and saw that I was "up against it." About 100 yards below me all three of the creeks came together, but I could not cross there without being in plain sight of the quarry, and the only way to come up to them unseen was to ford each of the streams separately, where they were about fifty yards apart, and where a dense growth of willows would shelter me from their sight.

There happened at that time to be a very high stage of water, which was ice-cold, and which did not afford a pleasing feature of the hunt, but I was after meat and must have it.

I took off my shoes and socks, rolled my trousers as high as I could roll them, and started on my venture. The streams were full of big boulders, and the high waters were tumbling down over them at a rate which made navigation extremely difficult, but I finally landed safely across the last one, dressed my feet, and made a circle through the willows until I had a spur of the mountain between me and the game, then ventured out into the open and began the ascent. It was a hard climb, but I finally got to the top, and, cautiously peeping over some rocks, I saw them scattered over the side of a mountain which was facing me, with a deep ravine between us, which was heavily timbered from the top where I was down to the bottom of the ravine. Being a little far away for sure shooting, and not having been seen, I crawled into the timber and worked my way to a favorable spot, then picked out a yearling buck and fired. There was a strong wind blowing out on the open mountain side which I did not feel where I was, and for which I did not make allowance, and my shot only made him raise his head and look surprised. Quickly throwing in another cartridge, I made due allowance for the drift of the ball with the wind, and that time the buck dropped in his tracks. Then they all ran together into a bunch and stood as close as they could stand when I picked out another and dropped it. Owing to the wind and the mountains on the opposite sides of the canyon, they could not determine from whence the shooting came, and I verily believe I could have cleaned out the half of the bunch before they could have gotten out of range, but two was all I could take with me, and all I needed, and after I watched them for some time, during which time they remained motionless, and I wished with all my might for a good kodak, I got up from my hiding place and started across toward them. Of course they soon saw me, and started up over the mountain, but even then they stopped at intervals and looked back, and were not out of sight

for several minutes. After dressing the carcasses and again performing the wading act to get my horse, I soon had them packed on the horse and was picking my way over the mountains to my bachelor home and my hungry neighbors, where there was rejoicing and feasting.

At another time I was riding from the post-office to the ranch of Cooke Rhea, at whose place I was staying for a few days while he was away. Cecil Lawrence, a neighbor ranchman who lived fifteen miles distant, happened to be in our park that day, and just as I got to the ranch I saw him riding up as fast as his horse could run. He told me he had just seen a bunch of mountain sheep over in the edge of the park, and they were all big rams, and he was very anxious to kill one, and wanted my rifle. I told him to go to my house, about a mile away, and he would find the door unlocked, as I always left it, and to take my rifle and ammunition which was about the most conspicuous furniture in the house. I watched him, and could see the sheep, but he failed to get a shot at them. I went over to Elick Hilton's, from where he had first seen them, and was there when he returned. I made no comment, but knew what I would do. After he had gone I went to Rhea's, got a horse and rode over where the sheep had disappeared in the mountains and left the horse and started on the trail of the sheep. I was not needing meat then, but had never killed an old ram with large horns, and thought there was a chance to get one, as there were plenty of places for the meat. The trail led through a long thicket of jack-pines, then out on to a bare, rocky knoll from which there was a good view of the surrounding country, and soon I saw the sheep half a mile ahead, on a bare knoll, and some were lying down. By a long and rough journey I was able to keep out of their sight, and crawl up within thirty yards of them, undiscovered. I cocked my gun and peered over the top of a rock to pick out the biggest horns, and there I saw, not a bunch of rams, but nothing but ewes, about a dozen, any of them close enough to have shot them in the head. I looked at them for a minute in disgust, let the hammer of my gun down, and raised up to see them scoot, and they scooted. He had seen their horns, supposed because they had horns they must be rams, not knowing that the females have horns also. That evening, when I told old Elick what I had done, and what I hadn't done, he said: "I knowed the way your ear wagged when you left there was something in the wind."

EMERSON CARNEY.

A Good Report from Illinois.

ROSCOE, Ill., September 22.—*Editor Forest and Stream:* Thinking that possibly a short communication from the State Game Commissioner of Illinois of what is being done in the way of game protection under the new game law would be of some interest to your readers, I append the following list of cases of violations of the law since August 1:

For killing ducks out of season, Gustave Engle, Ottawa, Ill., fined \$15; hunting without a license, two persons, Cobden, Ill., fined \$25 each; attempting to kill prairie chickens, Elmer Sanford, Lincoln, fined \$15; killing one prairie chicken, John Jenkins, Lincoln, fined \$15; killing song birds, several Italians, Galena, fined \$90; buying and selling squirrels, L. C. Reese, Anna, fined \$25; killing song birds, Harry Schrader, Chicago, fined and fine remitted, as he was only support of a widowed mother; selling squirrels, Moses Leyley, Alto Pass, fined \$25; hunting without license, F. Pecharo, Pickneyville, fined \$25; killing song birds, Louis Boris, Chicago, fined \$5; killing song birds, Geo. Doretors, Chicago, fined \$5; trespass, W. R. Riddew, Camp Point, fined \$3; killing song birds, Frank Ortlepp, Chicago, fined \$35; hunting without a license, John Monkus, Chicago, fined \$25; hunting without a license, Sam Vangilas, Chicago, fined \$25; trespass, two parties, Milmine, fined \$10; killing one robin, Chas. Heining, Chicago, fined \$5.

In addition to the above fines, each person prosecuted also paid costs of the suit. We have now got the State well organized with a good deputy warden in each county, who is giving his time and attention to the work and is receiving pay for such days as he is employed in actual duty.

The State has been divided into ten districts, with a good traveling warden to cover about ten counties each. The traveling warden's duty is to go over his district each month, after having selected deputies, and see that each is doing his duty, and in this way we feel that we can come as near enforcing the law as possible.

Licenses are being issued by every county, city and village clerk of the State, and there was received at the State Treasurer's office at Springfield, Ill., in July, \$2,136.70 for licenses issued prior to July 1, and August 1 there was paid into the State Treasury \$16,331.04 for licenses issued during July. The report for licenses issued during August has not been received from the State Treasurer, but from all reports received there will be from \$12,000 to \$15,000 at least paid in for licenses issued during August, as the reports from the State Treasurer each month are for the amounts received for the previous month. The money thus paid into the State Treasury goes directly back to the country, as the ten traveling wardens and 102 deputies have to be paid each month. The matter of getting the new law before the public, and the fact that something like 5,000 clerks in the State have to be furnished not only with blank licenses, but also with blank applications, blanks for reporting to the State Treasurer, and copies of the game law both in pamphlet form and in synopsis form on large cards, means a great expense, as it has taken to the various clerks of the State to date 73,000 license blanks with as many blank applications, numerous other blanks as mentioned, and over 80,000 copies of the game law.

The people generally over the State are much interested in the protection of game, as the matter had been agitated during the past two years to such an extent that not only the sportsmen but the farmers are awake to the interest of game protection, and the man who thinks he will slip out and kill a few birds out of season or without a license or in any other way violates the new game law, is very apt to be arrested promptly, for nearly every one of the deputy game wardens has friends throughout his county who are continually on the watch and notify him at once of any hunters that are out after game out of season or

contrary to law. We hope that by the time the new game law has been in effect a year, everyone will be willing to abide by its provisions.

A. J. LOVEJOY,
State Game Commissioner.

Preserves and Game.

Editor Forest and Stream:

A most interesting letter appears in FOREST AND STREAM of September 13, written by Coahoma, on the subject of private game preserves. Certainly private preserves are better than no preserves at all, and they are serving an excellent purpose in stimulating thought and discussion upon the subject involved. Legislation can only follow experience, and no precedents but our own will fit our own case.

The points raised in the beginning of Coahoma's article are sufficient to form the basis for an entire overhauling of the question of land tenure, its rights and its responsibilities. "May the owner exercise full right of ownership over a part of his lands and only partial rights over the remainder?" * * * This is simply one phase of the ancient warfare between the rich and poor; and further, as long as some men are lazy, thriftless, and incapable, and others are industrious, provident and efficient, so long shall we have the rich and the poor, and all the gradations of life between."

As to the question of what rights shall be exercised by men holding tracts of various sorts of land, this seems to me a question purely of legislation within certain very broad lines. Does any man really exercise "the full rights of ownership?" The fact is that there are very serious limitations to his ownership. And if his rights are limited to some extent already, why should they not be still more limited, if such limitation is for the public good. A stranger may mine gold on his property without paying for the privilege, and he himself may not direct a water-course within his own boundaries. He cannot close an ancient highway, and he cannot shoot game on his own property during the close season. In some States he is liable to prosecution for running deer with dogs on his own land, as if he did not own the land at all. The title to the game on his land is not vested in him, but in the State. Thus his powers within his own borders are very much limited under the existing laws. And, if this is so, why should not other limitations be created?

The right to close land to the public might very well be restricted to such lands as would be injured by the entrance of the public upon them. Otherwise it serves no useful purpose and may be a serious inconvenience. The game upon the land belongs to the public, and if it were the owner's caprice to exterminate it by poison or otherwise, he would be restrained by law. Unless the owner is making some actual use of the land, unless he cultivates it and has built his house upon it, the exercise of this right of exclusion is an arbitrary limitation which is not in accordance with public interest. This being the case, why should not the laws, which already limit the owner's privileges, be so framed that the public, having conformed to the game laws, may enter upon lands of certain classes for purposes of sport and recreation?

That the laws against trespass upon timber lands should be the same as the laws against trespass on cultivated lands or city property is absurd. Indeed, if any individual wishes to exercise any such privilege, it is altogether reasonable that he should be heavily taxed for it, and that it should come under some other regulation than the mere law against trespass.

W. M. E.

B. LITMORE, Sept. 20.

Iowa Shooting.

HUMBOLDT, Iowa, September 19.—The fall hunting season opened in Iowa the first of September. In the northern section the sport on ducks, principally young teal, has been good, but at this date, after furnishing nearly three weeks of shooting, the birds are pretty well shot off. Many sportsmen regard the young teal as the best of the duck family for eating; the young teal is to the duck tribe what the spring chicken is to the domestic fowl. In two or three weeks the big ducks will begin to come down from the north, and sportsmen will be ready to drop business at any time then for some favorite duck resort that they know of. It is the latter part of October and November that the best duck and chicken shooting is to be had, the cold weather driving the birds down from the north.

The prairie chicken shooting on local birds was practically a failure in Iowa this year. Of course in scattered spots in northern Iowa the birds gave sport for a day or two, but aside from that there have been no birds killed. There is some consolation to the Iowa sportsman for this, however, as he knows that the northern birds will make their appearance along some time in October, when the cold weather has driven the birds down. At that time the choicest shooting is to be had.

There has been plenty of fishing along the Iowa rivers this year. Many large fish of all varieties have been taken.

GEORGE J. BICKNELL.

October.

Ho! for the glens—the bosky glens
Of brown October time;
And the sombre fens—the browning fens,
And the meadows sweet with thyme.

Ho! for the brook—the babbling brook—
That flows from the fretted bower;
And ripples out of the forest nook
The home of the gentian flower.

Ho! for the breeze—the balmy breeze—
That wafts o'er the nut-grown larder,
Scattering leaves from the crimson trees
To the floor of the forest arbor.

Ho! for the time—the sunset time—
When the reddening sun in the westing,
Whispers a chime for the frosty rime
That forms while the earth is resting.

Ho! for the haze—the purple haze—
That hangs o'er the mountains' slumber,
Ho! for the days—October days—
Ho! for the Indian summer.

GEORGE W. BEATTY (Hawthorn).

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers, who handle the Brief.

In Old Virginia.

EVEN if there had been nothing else save the fact that we were camping in old Virginia, the Rod and Reel Club of Winchestertown would have enjoyed their outing this year on the banks of the Shenandoah. We camped right along the line of the Norfolk and Western Railroad, about two miles from Front Royal, and for the first time in five years took up quarters in a four-room house instead of under canvas. We could find no good place near the river to pitch our tents, and seeing this unoccupied building, which was put up by the Norfolk and Western for their workmen when the track along here was raised several feet, we concluded to stop right here, if we could rent it. We hunted up the party who had charge of it, and succeeded in renting it for 25 cents a week. Of course we missed the sight of the white canvas, but still we kept dry, and this year, in the tents, we would probably have got a little wet.

We left old Winchestertown about 2 o'clock Monday morning, and arrived at the river at 8 o'clock the same morning. We soon had the camp in order, for we had no tents to put up, no ditches to dig—nothing much to do but rig up our stove and make our beds. Heretofore we never fished any until the next day after our arrival, as it always took the best part of the first day to get the camp in order, but as we had nothing much to do this year, we decided to try the fish in the afternoon. The water was in splendid condition, and a great many anglers were down from Front Royal.

Charley Brown had the honor of getting the first strike, and he started his fish, but—the rascal made for a rock and that settled it. He was a good one (so Brown says), and I sympathized with him for I knew how he felt over it. I've been there myself. He got his next one, though,

THE 1903 CAMP OF THE ROD AND REEL CLUB.

of course, it was nothing like as large as the one that got away. The bass were in a biting humor on this particular afternoon, and by 6 o'clock we had quite a nice string to take to camp. How good it was once more to see the line slipping out over the reel—to feel the tug at the other end, and—then the fight. Ah! it's worth a million to any man! Let a man once go camping, give him a rod and let him wade the riffles, and unless his heart is as hard as stone, his eyes shut to all the beauties of nature, he will be inspired by the beautiful scenery, become fascinated with the sport of angling, and the next year he'll be at it again.

Arriving at camp we changed our wading clothes and put on dry ones, and then got supper. Once more we were seated around the old camp table, each man with a tin cup full of coffee by him and a great dish of fried bass before us. Once more we were camping—once more we were sniffing the pure fresh air wafted from the slopes of the old Blue Ridge, and were intoxicated with anticipations of the good times we were going to have. After supper we lit up the torch and played cards till 9 o'clock, when Quartermaster Dorsey Yeakley, as usual, announced that it was bed time, and we were soon off to the land of dreams. Our little mascot, Jack Greenwalt, was lying by the side of his bosom friend, Dorsey Yeakley, and, as he stirs in his sleep, he half whispers: "Here comes a 'double-hitter,' Dorsey." The Norfolk and Western run double-headers along here nearly altogether, and Jack always called them "double-hitters," and when only one engine would come along he would call it a "double-single." He always wanted to bet when he heard the distant whistle of the locomotive whether it was a "double-hitter" or a "double-single," and he would put up his cap, pants or anything he possessed on what he thought was coming. He is only about six or seven years old, and probably the youngest camper that ever left Winchester. He was the life of the camp, and we all enjoyed having him along.

The next day it rained, and rained hard, too, and consequently spoiled bass fishing for the next few days. But we rigged up our outline and lived on eels and catfish until the water cleared up. To me there was something very fascinating in running the outline at night—to lift the great big eels into the boat and take them off. Sometimes we would get as high as a dozen big ones at one haul. Carson Yeakley and myself always operated the outline, and what a time we would have out there in the middle of the river some nights. Sometimes there would be six or eight big eels floundering about in the bottom of the boat, and then maybe we would add a big turtle to the aggregation, and between the eels and the turtle and our bare feet we would have one mischief of a time.

The water was beginning to clear up now, and the prospects were bright for some good fishing. We had quite a nice lot of little "catties" down in the live-box, and were longing to "tenderly put one on." The next morning we decided to try it, although the water was a little cloudy.

Charley Brown was soon in his wading clothes and off for the riffles. Carson Yeakley (the handiest man and one of the best all-round campers we have ever had with us) and myself were right behind him, and Dorsey and his little friend Jack were to come down later on to help us bring back the fish. Out into the riffles we go; and with a swing of our rod send the line out into the rolling water. Mr. Yeakley got the first strike, and I knew he was just itching to pull on him, but he thinks he'll give him a little more time. Charley Brown, who was standing near him, tells him to let him keep on going, that the bass in the South Branch require a lot of coaxing. Carse coaxed him for some time, and finally he yanked on him and pulled him in. Charley scored next, and presently my turn came. We got one every now and then, and by noon we had a fairly good string, considering the water was not in first-class condition.

We had "tenderly put on" about the last of our catties, and in the afternoon Brown, Carson and myself rigged up a sort of a dip-net and started out to catch some minnows. Dorsey Yeakley said he was going across the mountain to hunt up a threshing machine, and we all knew what that meant—he was going out to hunt up some of the female gender.

We succeeded in catching about 200 nice river minnows, and were all ready to try our luck the next day.

It was the close of a hot August day. The surface of the old Shenandoah glinted in the red rays of the setting sun. The dark green forests surrounding our camp grew darker, as the tremulous twilight faded into dewy dusk. Blue smoke curled gracefully from our stove. A tinkling sheep bell broke the stillness and a twinkling star peeked from the dusky vault above and gave us some encouragement as to the fishing on the morrow, but still we were doubtful. Mr. Carse Yeakley had gone down to look at the outline, and had you been along the river in that vicinity you could have seen a solitary pedestrian wending his way up the track of the Norfolk and Western, with his head down, but every now and then looking up to see if the clouds were breaking. But all was dark and he continued his way toward camp.

"Boys," he said, as he came through the gate leading to camp, "I'm afraid our fishing is done for to-morrow. It looks threatening, and I think we'll have rain, and plenty of it, before morning."

His prediction came true, for it rained. My! but it rained hard. We had the live-box containing the minnows tied to a rope and thrown out into the river, and when it commenced to rain Dorsey and myself slipped on a gum coat apiece and went down and got out the box, and putting the minnows into a strainer carried them high and dry and set them down into a lard can filled with fresh water. Had we left them in the live-box in the river they would have all been gone the next morning, for the river was almost out of banks. The old Shenandoah was muddy and was muddy right, too, and she staid muddy the rest of the time we were there. We had to content ourselves with the eels, perch, and catfish, and, when we were lucky enough to catch them, they made good eating, I can tell you.

Time was drawing near to leave, and we began to appreciate our living along the Shenandoah more than ever. It was hard to think that we had to leave these laughing, muddy waters which would soon be clear as crystal, when the bass would be jumping crazy for the fly, but our commissary said "everything was out," and nothing remained but to turn our faces toward old Winchestertown. So we bid a last farewell to the blue mountains of the old Blue Ridge, to the musical murmurings of the riffles, and to the distant whistle of the "double-hitter," as Jack called them, and started for home, hoping some day to return and live over the good times we had had along the Shenandoah.

ALF CLINE.

Fish and Fishing.

Ouananiche Season Extended.

REFERENCE has been more than once made in this column to the advisability of a change in the open season for ouananiche. There is room for a great deal more knowledge of the life history of this fish than all that is at present possessed, though there has been considerable observation in recent years as to its breeding operations, all tending to corroborate the contention that the ouananiche is a later spawner than the brook trout, notwithstanding that its close season has, until now, opened a fortnight earlier than that of the trout. It has taken the department of Marine and Fisheries at Ottawa a long time to arrive at a conclusion upon the mass of expert testimony submitted to it upon the spawning habits of the ouananiche, but it has finally accepted and acted upon it, and last week an order in council was adopted by the Governor-General in Council extending the open season for this fish in Canada by fifteen days, so that it will hereafter close upon the 30th of September, as that for brook trout does, instead of upon the 15th of the month, as hitherto. This is all right as far as it goes, but the close season for ouananiche, which is now made to terminate upon the last day of November, should certainly be extended to the last day of April, as that for trout is. Only pot-hunters with nets and bait can take the ouananiche in the spring of the year prior to the first of May, and for these there are plenty of varieties of coarse fish to be taken in and near the chosen waters where the ouananiche are waiting. Ouananiche fishermen in Canada will hereafter, like trout fishermen, be able to spend the whole month of September in the woods, dividing their time between fishing and hunting.

Anglers Do Some Shooting.

And so far as the hunting is concerned, this last month of September has witnessed the killing of many fine specimens of both moose and caribou by anglers in the Lake St. John country. Only last week two New York members of the Metabetchouan Fish and Game Club were returning to the club house at Lake Kiskisink, after fishing in the lily-pads a little below the railway bridge, when a fine three-year-old moose stepped out upon the railway track immediately in front of them. One of the two, Mr. Geo. H. Wilcox, was carrying a .22 caliber Winchester, and firing at the animal at a distance of only fifty yards, brought it down at the first shot. Another fisherman,

Mr. Swayne, of Wisconsin, got a fine moose last month while fishing on the Triton Tract; Mr. Armus got another small one at Lake Edward; Mr. Darling, of New York, one on the limits of the Quebec Piscicultural Association, while two Quebec boys, Arthur Chambers and Rockett Power, were lucky enough to get a splendid moose with a good head about thirty miles back from Lake Edward. The lads had been fishing and saw the moose emerge from the woods on the opposite side of the lake like a small moving mountain. Sighting their rifles, one a .44 Marlin, the other a Stevens .38-55, at four hundred yards, they fired together, and brought down their quarry, both bullets taking effect. Mr. George E. Hart, while fishing the other day on Lake des Passes, was almost run down by a splendid bull caribou, which got safely away from him, notwithstanding that several shots were fired after him from the canoe. Several caribou have since been killed on both the Tourilli and Triton Tracts by anglers who were carrying rifles with them over portages and in their canoes.

Successful Trout Fishing.

Some of the trout fishermen are still in the woods, notwithstanding that the fishing terminated on the 30th inst. Having packed up their trout rods they are now out with rifles looking for big game. There will certainly be some interesting fish stories when they return home, for the last month of the trout fishing season this year has yielded better sport than for a number of years past. Lake Edward has not produced so many six-pound trout for many seasons as it has during the last few weeks. Almost equally satisfactory reports come from all the fish and game clubs in northern Quebec. In Lake des Passes, in Lake Batisseau, in the Lightening River and the River Moise on the Triton Club limits, the fishing during the last month has been simply superb. The fish have not only been plentiful, but have run large as well. Cloudless days, with a warm, balmy air, and cool, starlight nights that painted the woods with crimson and gold, made the out-of-door life a continual benediction. The beauty of all created things within the range of vision and the profusion and wealth of fish and forest life in these high latitudes are an inspiration at all times to those of us who love to hold communion with nature, to study to be sometimes quiet, and to go a-fishing; and though, as Father Walton reminds us, "Everything is beautiful in his season," it seems to me that the season of all seasons for the matured and perfect beauty of nature's year is the month of September, at least in the sun-kissed forests of northern Canada. The heavy trout which sought the cool retreat of the deepest holes during the months of July and August felt the bracing effects of a few cold nights, and freely rose to the anglers' flies in the soft dreamy light of the recent balmy September days. General J. Fred Pearson and General McKibbin were among those who enjoyed exceptionally good sport on the Triton Tract. The members of the Metabetchouan Club fared equally well. They never had better fishing than during the last month. Mr. Wilcox, of New York, and Mr. W. D. Bishop, of Bridgeport, who have spent some time on the club waters since Senator Platt came away, have made some excellent catches. On Lake Commissaire several members of the Nonantum Club remained at the club house until the end of the season. Among them were Mr. Brown, of New Haven, president of the club, and Mr. A. W. Hooper, of Boston, a prominent member of the Winchester Arms concern. They have had splendid sport, taking a number of five-pound trout on the fly, both in Big Ear Lake and also in Haycock's Pool in Lake Commissaire.

Heavy Maskinonge.

Opposite Brockville, in the St. Lawrence, a party of Montreal anglers had the good fortune to kill two maskinonge, both exceeding thirty pounds in weight, a few days ago. Of course much larger ones are occasionally taken in the St. Lawrence, and I have before me a letter telling of a maskinonge taken in Lake Bemidji, Minn., a few weeks ago, which is said to have measured four feet seven inches in length and to have tipped the scales at fifty-four pounds. But two in one day weighing over thirty pounds each is a catch not to be despised.

E. T. D. CHAMBERS.

Fishing Up and Down the Potomac.

Sun Spots and Potomac Fishing.

THE sum of human knowledge is so small, and resistance of belief to the unaccustomed so strong, that the suggestion of even a remote relation between Old Sol's freckles and a fishing line is apt to excite derision rather than inquiry, yet circumstantial evidence, or perhaps it would be more accurate to say a series of coincidences, would seem to establish an intimate connection.

There are many agriculturists who regulate their rural routine by the phases of the moon. It is notorious that potatoes planted in the dark of the moon thrive best. Anglers, too, have found our satellite a guide to seasons when they may catch and when they are sure to fail. There is an old lunar calendar for anglers fitted for every day in the year which declares the very best, the middling and the poor days in which to try for nibbles.

If the inconstant moon may thus point out the days and nights when fishing is good, why should it be considered impossible that the parent and supporter of our universe should determine the years of plenty and the years of famine of our watery harvests?

The period of maxima of sun-spots has not been very accurately determined. It was for long thought to be ten and a half years; a later authority fixed the period at 11.11 years, and, roughly speaking, eleven years has been the average for the comparatively few years the subject has been under investigation with the aid of modern appliances that will in time make a scientific deduction possible.

The later recurrences of sun-spot maxima took place in 1848, '60, '70, '81, '92, 1903. The period is not quite fixed, as it is twelve years from '48 to '60, and ten from '60 to '70, but the eleven years average held good.

Beside the eleven-year period is the shadow of one at nine years, and indications which seem to point to a grand climacteric in fifty-six year periods which has been attributed to, or at least a coincidence noted with the

occurrence of the conjunction of a couple of the major planets, but these we need not take into account. For our purposes the fairly established eleven-year periods are plenty.

The curves of sun-spot recurrence are far from regular. As an instance, the decrease from 1860 did not reach a minimum in 1865 and then mount again to 1870, but there was a diminution for seven years to 1867, and then a maximum reached again in three years or 1870.

The cause, the progress and the influence of these spots have not yet been clearly demonstrated by science, but a comparison with tabulated observations of other meteorological phenomena has, it has been universally conceded, shown such coincidence of recurrence as to establish some intimate connection, if not prove a direct effect, from this cause.

Among these is excessive rainfall; while freshets may occur in any year locally, the general devastation which comes with such regularity throughout the States having, of course, its worst demonstration in the immense valley of the Mississippi, comes with singular coincidence about those years when the sun-spots are at a maximum.

Take as an instance the floods in the Central Mississippi Valley and '81, '92 and 1903 coincide exactly with the sun-spot periods, though it would not be fatal to the argument if they did not. Floods a year before or a year after the maximum sun-spot date would still be referable to the same causes, since excessive precipitation may run along for two or three years during the sun's high point for spots.

It is not claimed that high water is always fatal to good fishing. In salmon fishing, for example, patient anglers must sometimes wait until there is a "spate" or freshet on before the fish will rise. In the rock-bound lakes of the north no harm is done save a little rise in the waters, and in mountain streams where mud does not follow rain a few hours' fall may leave the stream as inviting as before; but in low ground rivers, in settled communities, where the destruction of the forests sends the water hurrying all at once to the channels, and where the fields along the riverside send their yellow drainage to its bed at once, days must pass and sometimes weeks, in a stream hundreds of miles long, like the Potomac, before there is any reward for wetting a fly or watching a bob.

Last year the rains were so heavy and so many that few fish were caught; and this year has been one of disappointment to the anglers of the Potomac, for there have been few days since the season opened when the water has not been discolored.

A still more serious result in the lessening of the bass supply by floods is in the destruction of spawn beds. As is well known it has been found impracticable to artificially propagate bass—not only from the difficulty of stripping the milt from the living buck, but because the roe is so viscid as to at once adhere to any thing it touches and clings so closely to the bottom of the receiving pan as to interfere with the fertilization of the ova. This, fortunately, is no great drawback to stocking waters with bass, since pre-eminent among fishes as nurses the parent bass take such good care both of nests and young as to raise a great proportion of their progeny, and so any waters with favorable environment may be easily peopled with this king of the rod and platter simply by the introduction of a few pairs.

His nest is a bowl of gravel which is carefully cleaned and the ova adhere to this gravel. Freshets in the spawning season work great havoc to the crop not only by washing out the gravel beds if the flood is strong enough, but in covering the beds with mud, and thus smothering the eggs and young.

To this must be added the dangers of heavy floods to the local stock by the washing down of both young and adult fish caught in the torrent. Instinct sends the fish with fixed abodes to favorite places of shelter when the storm threatens, but, as with man, their places of shelter are sometimes destroyed. So altogether flood years may be taken as most disastrous to the supply of bass in the Potomac; and add to this the days and weeks when the stream is yellow and thick with the waste of the valleys hastening to the sea, and the angler's heart grows sick with the hope deferred of a holiday by the river's brim.

The application of this theory has been confined to the Potomac, where experience has demonstrated there must be something in it, but it is readily conceded that dissimilar circumstances and conditions may make flood years or sun-spot years good fishing in other localities.

As a case in point, the Great American Bottom, a valley nearly ninety miles long on the Mississippi River, on the Illinois side from Alton, past St. Louis to Grand Tower, and from three to five miles broad, has been overflowed in the sun-spot periods for the last thirty years. It is just drying out from a recent flood; it should be threatened next year, and there is a reasonable certainty of trouble in 1914. The river-bed has been silted up, leaving a depression between the channel and the Illinois bluffs four or five miles away.

When a general flood comes, this valley is so covered with water that steamboats may reach the bluffs in places, and there is a sea of five miles in breadth and an average depth of four or five feet full of the fish from the river. As the waters subside these are gradually let down into a chain of narrow lakes down the center of the valley, and these lakes become tremendously overstocked. In the following year, when the waters have had a chance to clear, these overstocked lakes sometimes afford the most wonderful fishing in the world; at any rate no angler's story has yet been written that is any exaggeration over the sport that has been secured under these conditions with fly and bait in this locality.

One other suggestion occurs in connection with poor fishing years in the Potomac, and that is if the destruction of fish is not too serious, the discolored waters act as a close law or protection by preventing the capture of the bass, and as a consequence one is justified in expecting very much better scores when the good seasons arrive. This river has proven one of the very best as a country by adoption for both the black basses; the small-mouth thriving in the rocky channels of the system above Great Falls, and the large-mouth has found the great tidewater estuary below just suited to his needs. The latter in particular has so multiplied as to form an important factor of the netters' income, and the great number captured in this way only has prevented the fifty miles be-

low Washington from being as famous as the Florida streams for size and numbers of its yield.

HENRY TALBOTT.

Lake Champlain Pollution.

STRONG pressure is being brought to bear on the State authorities to close the two pulp mills whose refuse is said to be poisoning the waters of Lake Champlain, the Bouquet and Au Sable rivers, and the waters of the Au Sable chasm. The warfare between the Lake Champlain residents and the owners of the pulp mills has been on for over ten years now, and the latter have invariably won out, their mills never ceasing to grind, despite all dictums of the law.

Meanwhile hundreds of tons of fish, according to an accredited authority, have been killed, either being thrown up on the shore or remaining in the lake, still further adding to its pollution. It is asserted by property owners along the lake that poisonous substances from the mills are being discharged into it in such large quantities that unless the practice is stopped fishing in the lake will be ruined within a few years. Added to this the shore line for many miles on the New York side of the lake, it is reported, has been rendered unsightly by accumulations of noxious slime, to say nothing of the destruction of the grand historic forests in the interests of the owners of the pulp mills.

Early this last summer formal complaint was made to the State authorities by riparian owners on the lake, and in response to their representations Prof. Olin H. Landreth, of Schenectady, consulting engineer of the State Department of Health, has finished an official investigation, which, it is said, will result in definitely establishing the fact that the waters of Lake Champlain are polluted by the sludge from the two mills. It is believed that on the basis of the report that will soon be made to Governor Odell by Prof. Landreth the Governor can proceed under section 6 of the public health law to force the local officials to abate the nuisance.

On his tour of investigation Prof. Landreth was accompanied by Edward P. Hatch, Jr., of the firm of Lord & Taylor, of this city, who, as a large property owner in the Lake Champlain section, has been active in the fight against the pulp mill nuisance. When seen by a representative of FOREST AND STREAM, Mr. Hatch said he thought that the evidence obtained by Prof. Landreth was conclusive in substantiating the complaints made by the property owners along the lake. "We first looked into the pollution of the Bouquet River," said Mr. Hatch, "by what is called the soda mill of the New York and Pennsylvania Company, one of the chief offenders in this direction. This company uses poplar logs and the refuse of the tons of chemicals is carried out into the lake. Prof. Landreth made soundings to find out about the banks in the lake formed by this refuse—a gray precipitate. These banks are agitated and spread through the water every time a strong wind blows. He also took samples of the slime that was to be found on the banks.

"From the neighborhood of the Bouquet River we went along to Willsboro Bay, and on the shores and the point we found the same conditions of pollution apparent. The Au Sable River water looked like coffee, and has such a fetid odor that it made one of the ladies in the party ill. A dog we had with us refused to drink the water, and even the cattle, we are told, will not drink it.

"The hack drivers at Au Sable Chasm told us that visitors were now noticing the odor from the water. It is now a well-known fact that the discharge of chemicals from the mill into the Au Sable River has left a sediment in the chasm which throws off an extremely offensive odor, kills vegetation, and coats the rocks with slime. This substance collects on the eddies of the river, where it pours through the chasm, and has practically ruined its attractiveness as a resort.

"The water mains of the village of Keeseville are known to have become so clogged with the refuse from the mills that much of the force of the water has been lost. The attention of the insurance companies has been called to this feature of the case, and their representatives are now making an examination with a view to cancelling policies or raising rates, if the reports are substantiated.

"The position of the mill owners is simply one of dollars and cents. It is conceded that the refuse can be disposed of in other ways, but in no way so cheaply as dumping it into the stream on which the mills are located, and so for financial reasons they are likely to continue the practice until compelled to stop it.

"The waters of Lake Champlain, once so noted for their purity, will in a few years be polluted beyond redemption. The enormous amount of impurities that are dumped into the lake by the Wellsboro and Au Sable pulp mills for at least ten years has pretty nearly converted a part of the lake into a huge sinkhole.

"As I said before, the chemical deposit is not soluble. It is a precipitate, and sinks to the bottom, but is of such light specific gravity that the slightest disturbance of the water will suspend it, and send it to discolor and befoul the shores.

"The State chemist of Vermont tells me that after each west wind quantities of dead fish come ashore, and the peculiar odor and taste of the water in Burlington is due to the same cause. The stones on the shore of Four Brothers Islands and Wellsboro Point are covered with slime, and I have seen a long streak of the pollution as it spread itself in a 'milky way' on its travels down the lake.

"As the two mills are daily dumping tons of impurities into the waters of the lake, it is a self-evident proposition that in a few years, unless something is done, the whole body of water will become a cesspool. Immediate action must be taken to preserve the waters that history and nature have made famous throughout the world.

"The mill owners say they wish to abide by the law, but claim that although they have spent enormous sums of money for the purpose they cannot dispose of the baneful residuum. All poppycock.

"I have talked with the leading citizens of Keeseville, and they are in great distress over the destruction of the Au Sable River and the personal inconvenience the nuisance is causing them. They cannot drink the water, and the plumbing is so choked with refuse that it necessitates frequent overhauling. The proprietor of the hotel

tells me that when the windows in his house are open the odor is offensive and unhealthy. The marshes and lowlands about the mouth of the river are covered with a glue-like substance, and the action of the sun causes a frightful stench. I have myself seen the white scum covering almost the entire surface of the river as it flows under the arched bridge through Keeseville.

"There is no disposition to throttle the mill industry, nor any raid to impair the value of any investment, or to work a hardship on those whose livelihood depends upon the operation of the mills. There is no effort to oppress anybody, but there is a very lively and active disposition to bring about an abatement of the trouble."

Mr. Hatch then showed a letter he had received from Congressman Joseph C. Sibley, of Pennsylvania, who owns a fine summer place on the lake. It speaks for itself:

"In reference to the much-talked-of nuisance created through the pulp mills discharging their refuse into Lake Champlain, I must say that my attention has been many times directed to the Saranac, Au Sable and Bouquet rivers. The Au Sable is a disgrace, and I believe the chemicals, together with the sawdust, will destroy the fish in the lake; certainly will drive them from that portion of the waters of Lake Champlain. The fishing in Lake Champlain now is so poor that it does not interest me to any great extent. The fact is on the New York side there is practically no fishing. I think they are already driven out. When I go fishing it is generally over on the Vermont shore."

Mr. D. W. Middleton, of the Forest, Fish and Game Commission, in a letter to Congressman Sibley, says:

"We find mill owners willing to do everything in their power to remove the causes of complaint, and in the instance to which you refer are spending thousands of dollars in an endeavor to remedy the difficulty. We trust that in the near future the efforts of the commission and the mill owners will result in a satisfactory solution of the problem as to the best method for the disposal of refuse so as not to contaminate public waters."

The mill on the Bouquet River has been in operation since 1890. Soon after it was started Major J. Warren Pond, chief game protector of the Forest, Fish and Game Commission, brought an action against it, which resulted in an alleged promise on the part of the owners that they would construct a pool to collect the chemicals discharged from their mill. It is what is known as a soda mill. In the manufacture of pulp it uses poplar logs, and it consumes many tons of chemicals every day. The chemicals, when discharged into the river, are carried by the current a distance of three miles into the lake and are suspended there in the form of gray precipitates.

In spite of this alleged promise, the evil continued until Gov. Roosevelt's term, when the Forest, Fish and Game Commissioner employed special counsel and brought another action.

When all the evidence of violation had been compiled, an action against the mill was brought in the county court, and the case was so strong that the defendants compromised. On their promise to offend no longer, the action was discontinued.

Soon afterward the Forest, Fish and Game Commission was merged with the Forest Preserve Board, a new set of officers took control, and the owners of the mill, it is said, forgot their promise.

The mill on the Au Sable River uses spruce timber in making its pulp, and employs large amounts of sulphurous acid gas. This mill is more than ten miles from the mouth of the river. The village of Keeseville formerly drew its supply of water from the river, but the stream became polluted to such an extent that it had to be abandoned. Owners of the mill admitted their responsibility by offering to find the village another source of water supply.

Mills at Ticonderoga and elsewhere have spent thousands of dollars to dispose of the chemicals which they use without polluting the lake. It is alleged that the establishments on the Bouquet and Au Sable rivers are the only ones in the entire State which are permitted to defy the law with impunity. Both these streams were formerly prolific with game fish. The poisonous quality of the water of the spawning grounds for bass, pike, pickerel, after causing tremendous destruction, has now driven the fish entirely away. As the chemicals are insoluble in water, the accumulation is continually growing. It is predicted that five years more will entail the most serious results.

On account of the noted purity of its water, Lake Champlain has been considered as a possible source of supply for New York city. For a long time there has been great indignation among Lake Champlain residents over the inactivity of the State authorities. They are convinced that the immunity the pulp mills enjoy is due to political or other influences.

In commenting on the continued pollution of the waters of the lake and the never ending destruction of the noble forests round and about it, Mr. Hatch, in enthusiastic vein, said:

"Around no other section of the country cluster historical associations so brilliant and memorable. In the annals of a century and a half by successive deeds of daring, by bloody forays, by the romances of border warfare, by the conflicts of fleets and armies, the waters and the shores of Lake Champlain have been consecrated as the classic ground of America. In those merciless contests in which France and England were the allies of savage tribes, in the long and sanguinary conflicts between those great powers, in the war of the Revolution, and that of 1812, the whole course of the lake was stained with blood, and emblazoned by feats of glory. How long, I wonder, will the people of New York State and of the nation continue to regard with indifference the desecration of this consecrated spot!"

Common Names of the Basses and Sunfishes.

BY HUGH M. SMITH.

Extracted from U. S. Fish Commission Report for 1902, pages 353 to 366.

THE strictly American family of fresh water sunfishes and basses (*Centrarchidae*) consists of numerous species, including some of our best-known fresh water fishes, which are much sought by anglers, and contribute largely to the food supply. The family is well represented in nearly all parts of the United States east of the Rocky Mountains, in Canada and Mexico, and one species is found in California.

Some of these fishes are known only to the ichthyologist, and have no distinctive names by which the layman may designate them; others can claim only book names which have never come into use and probably never will; and others have received a large number of vernacular names, some general and some local in their application. Some of the popular designations are appropriate and distinctive, but others are misleading, inaccurate, and indefinite, and much confusion has been occasioned thereby in popular literature and in legal papers. This compilation is offered in the belief that a key to the numerous names of these fishes will be useful to fishermen, fish-culturists, and legislators. There is no intention to lay undue stress on the importance of common names; on the contrary, it is thought that the multiplicity of names here shown serves to emphasize the necessity for definiteness which can, in many instances, be secured only through the use of the technical names.
